The organization of this paper is as follows. The following section provides an overview of related literature. This is gathered from two main bodies of theory. First of all, the literature on the turnout paradox is reviewed. Second, because the problem will be argued to give rise to conflicts within and between groups of individuals, studies concerning these conflicts will be reviewed as well. In section 3 the experimental design is presented, as well as the parameters chosen, and the questionnaire used to supplement the experimental results. In addition, some general results will be presented. Section 4 presents models of individual decision making for the problem at hand. This analysis consists of three parts, a static game analysis, a dynamic game analysis and an analysis based on the assumption that participants are only bounded rational and *learn* how to make decisions as the experiment evolves. In the latter case, some simple learning processes are looked into. This section also confronts some of the theories presented with our experimental results, by formally deriving and testing hypotheses. More hypotheses and tests are presented in section 5. Most attention is focussed on the experimental results, but some interesting results from the questionnaire (concerning individual orientation and goals) are discussed as well. Finally, section 6 presents a concluding discussion.

2. A Short Review of Related Literature

Voter turnout

There is a reasonable amount of theoretical literature on the problem of voter turnout in elections. The formal literature on this subject was initiated by Downs (1957). He argues that expected benefits from voting in large-scale elections should be computed as the benefit to be obtained if one's favorite candidate or party wins times the probablity of being decisive in an election. Of course, this describes a typical winner-takes-all election. In a system of proportional representation, the expected benefit should be defined as the marginal effect of an individual vote on the benefit. This marginal effect is a decreasing function of the overall turnout level.

In both type of elections, the expected benefit is generally low. Downs argues that it will usually be outweighed by the costs of voting, implying that casting a vote is an irrational act. Rational behavior would lead to abstention in general elections. In real life, however, turnout in general elections is usually relatively high. This contradiction between theory and practice is often referred to as the 'voting paradox'.

After Downs, various attempts were made to develop theory that would predict larger turnout in elections. Riker and Ordeshook (1968) argue that voters may derive utility from the act of voting per se, through the fulfilment of a sense of 'civic duty'.[1] Riker and Ordeshook have been criticized because of the ad hoc nature of their civic duty concept (see Barry, 1970, for example). Just adding a variable with positive value to the utility attributed to voting, without explaining where this variable comes from is at most a first step towards a solution to the paradox, of course.

Ferejohn and Fiorina (1974) show that defining rationality as minimizing maximum regret instead of maximizing expected utility makes it more likely that the act of voting is rational. These authors have been confronted with a number of theoretical objections to their minimax regret analysis, however (see a number of contributions to Vol. 69 of the *American Political Science Review*, for example). One objection put forward is their prediction that the probability of being decisive in an election has no influence on the turnout decision. This is contradicted by empirical results (for recent evidence, see Kirchgässner and Schimmelpfennig, 1992) and by the experiments to be presented in this paper (cf. section 5). The Ferejohn and Fiorina study was extended by Grofman (1979) who did not meet the major objections, however.

In the eighties, game theory was used to find solutions to the voting paradox. The decision to vote or abstain was placed in a setting of strategic interaction of individuals. The general idea is that if everyone knows that it is rational for everyone to abstain, one might expect zero turnout, in which case it would be rational to vote. Palfrey and Rosenthal (1983) model the turnout decision as a so-called participation game.[2] In this game, players in two or more teams have to make a decision, whether to participate in an action that is beneficial to everyone in the team or not. Participation is costly but increases payoffs in one's own team and decreases payoffs in the other team, *ceteris paribus*. Payoffs (net of costs) are equal for everyone in the same team.

Palfrey and Rosenthal assume identical costs for all players. Moreover, payoffs to the teams are assumed to be symmetric and of a 'winner-takes-all' nature. They distinguish two ways of dealing with an equal participation in both teams. In one case, ties are broken randomly with equal probabilities of winning. The second case concerns appointing one of the two teams as winner in case of a tie. The first case is in line with one of the set-ups chosen in the present paper. Having formalized the turnout decision as a participation game, a series of (Nash-) equilibria is derived. Pure strategy and some mixed-pure and mixed equilibria are derived. It is shown that in many cases equilibria with substantial turnout exist. Well-known is the Palfrey and Rosenthal result that in some cases turnout may rise as the costs of voting rise. This Palfrey and Rosenthal representation of the turnout decision is the basis for the structure of our experiments and game theoretic analysis (sections 3 and 4, respectively).

Ledyard (1984) presents a general equilibrium model in which voters are uncertain about other voters' costs and preferences. He finds some equilibria with positive turnout, but one major equilibrium shows zero turnout. Following the Ledyard paper, Palfrey and Rosenthal (1985) add the same kind of incomplete information (voter uncertainty) to their previous model and find that, contrary to their earlier results, even slight uncertainty yields equilibria with zero turnout if no civic-duty type of concept is used. In another game-theoretic study, Owen and Grofman (1984) also conclude that arguments other than the effect on the election outcome are needed to induce a large number of people to vote.

Game theoretic approaches (i.e. the modelling of strategic interaction of individuals) seem to provide promising tools to analyze the voter turnout problem. However, in the game theoretic models

---

[1] The idea of having a sense of civic duty enter the utility of voting was also mentioned by Tullock (1967: 110).

[2] A participation game is a special case of a team game. The latter consists of two (or more) groups of players. Within a group, players have identical and common interests, but the interests differ between groups. Each player individually makes a decision on a level of action. Individual costs are increasing in the level of action. Payoff to a player is an increasing (decreasing) function of the level of action of all players in her or his team (the other team).

presented above, no convincing equilibria have been found in which substantial turnout levels are predicted. A major problem may be that the studies undertaken have treated the problem as a one-shot game, neglecting aspects of the repeated nature of turnout decisions. For a further discussion, see section 4.

In more recent work, the 'other arguments' mentioned by Owen and Grofman have been sought by focussing on the role of groups. In a team (or participation) game setting, groups (teams) play a central role, of course. For groups as a whole, positive turnout may be rational, assuming that groups are large enough relative to the population size to seriously affect the election outcome. The role of groups has been discussed in a winner-takes-all set-up by Uhlaner (1989) and Morton (1987,1991). Schram and van Winden (1991) do the same for a system of proportional representation. Rationality at a group level does not imply that turnout is rational for individuals in a group, however. In a participation game, there are incentives to free-ride on the choices of co-members.

In Uhlaner (1989) and Morton (1987, 1991) it is simply assumed that group leaders will provide selective incentives ('private benefits') for individual members to overcome the free-riding problem. It is not clear whether it is rational for group leaders to do so. The individual vote decision is not addressed very thoroughly either. In both models, a general equilibrium approach is applied, where voters and candidates act simultaneously.

In Schram and van Winden (1991), a partial equilibrium approach is chosen in the sense, that party positions are assumed to be fixed. A detailed model of the turnout decision is given, however. Optimal turnout for groups as a whole is derived first. Then, within-group processes are described in which some members try to convince other members to cast a vote. It is shown that it may be rational for some members to act as group leaders in this way. The pressure produced by these leaders may induce other members to cast a vote. The paper thus presents a kind of endogenization of the civic duty concept of Riker and Ordeshook. The proportional representation set-up chosen is one of the configurations used in the experiments described below.

In the present paper the role of groups in the individual turnout decision is investigated more closely. Equilibrium in decisions at a group level[3] and equilibria at an individual level are distinguished. These do not always coincide and both may diverge from Pareto optimal decisions.[4] It will be investigated whether the level of group identification has an effect on the level to which group-level equilibria affect individual decisions.

Typical for team games like the ones used to describe the turnout decision is that both inter- and intra-group conflicts exist. Between groups, a prisoners´ dilemma situation occurs, whereas a social dilemma describes the situation within groups. As Bornstein (1992) notes, both levels of conflict must be studied simultaneously. Bornstein does this, but as far as we can see he is the only one that does so experimentally, other studies focus on one of the two conflicts. Because of their relevance for the problem at hand, a brief review of studies on these two types of conflict will now be presented.

Experiments on Intra- and Inter-group Conflicts

Whilst intergroup conflicts have received attention in the non-economic literature (see below) experimental economists have mainly focussed on intra-group processes. We start with the latter.

Intra-group conflict studies typically address problems of the voluntary provision of public goods. In these problems individuals are faced with a situation where they have to decide whether to make a voluntary contribution to obtain a public good for all participants. In general, some contribution threshold is required to obtain the public good. In this set-up there are free-riding incentives for all individuals: they would prefer to have others provide sufficient contribution so they can obtain the good without enduring costs. In the context of the turnout decision, the public good for a group

---

[3]Morton (1991) uses the term 'group rationality'. We refrain from using this type of reference to groups as actors.

[4]Throughout this paper, the term 'Pareto optimality' is used to indicate the decisions that maximize the sum of payments to the individuals, i.e., the Pareto-criterion after application of the compensation principle is used.

concerns electoral victory, whereas the contribution is made by the individual vote.

An early study on voluntary provision (in the context of collective action) is by Chamberlin (1978), who is interested in the effect of group size on the level of contribution. One of his results is that individual contributions are negatively related to group size. Though the paper does not really focus on the level of free-riding, the extent to which this occurs does not appear to be very great. Smith (1980) presents the results of a series of computerized public good experiments and finds no "credible" increase in free riding behavior as group size increases.

Schneider and Pommerehne (1981) and Marwell and Ames (1981) conducted experiments (neither took place in a laboratory) to investigate the occurrence of free-riding. Both papers conclude that free-riding occurs, i.e., suboptimal levels of public good provision are found, but the level of free-riding is much smaller than one would expect from (economic) theory.[5] Subsequent authors sought to investigate why the free-rider hypothesis did not receive much support in these experiments. Kim and Walker (1984) describe 9 'invalidating factors' that might explain the previous results.[6] These factors include problems like 'misunderstanding and vagueness' and 'insufficient economic motivation'. In their own experiments (which were sloppy in design) a remarkable amount of free-riding is found.

A systematic analysis of the occurrence of free-riding behavior in a voluntary contribution set-up is presented by Isaac, Walker, and Thomas (1984). Among other things, they find the free-riding increases as the marginal return of contribution decreases or as the experience of participants increases. In addition, they find that ceteris paribus (i.e., including constant marginal returns) group size does not have an independent effect on free-riding. Isaac and Walker (1988) extend their previous work (with Thomas) on the effect of group size and marginal per capita return on the provision of public goods. Once again they conclude that the negative relationship between group size and individual voluntary contributions is due to the declining marginal return and not to the number of individuals in a group per se.

An important article in this field is by Isaac, McCue, and Plott (1985). A voluntary contribution mechanism for a continuous public good is investigated in a series of one shot set-ups. Induced value theory is applied, avoiding reference to real world situations. Varying conditions, Isaac et al. reach various conclusions. Substantial free-riding is found, that increases with replication. An interesting result appears to be that communication among participants increases the level of contribution.

Andreoni (1988) elaborates the often found result that finite repetition yields a decay of the contributions towards a free-riding level. He uses experiments to investigate whether this phenomenon is due to 'learning' by participants (it takes a while to understand what the 'optimal' behavior is) or strategic behavior in the repeated game constituted by the repetitions. He concludes that strategies do not play a role in the observed behavior. 'Learning' behavior appears to exist but cannot explain the complete phenomenon. Andreoni uses the term 'learning' lightly. An analysis of this behavior that is more in line with recent theories on the subject is presented in section 4.

Palfrey and Rosenthal (1988) extend the theoretical analysis of games of public good provision. The effect is investigated of the introduction of altruistic behavior by individuals. Not the effect of the altruism itself is focussed on, but the uncertainty of individuals about the altruism, and therefore contributions, of others. Using a Bayesian approach testable predictions are derived, especially with respect to comparative statics. The theory is found to be supported by existing experimental data. An extension of this approach to the case of participation games, in a dynamic setting, is presented in section 4.

As for intra-group conflict studies by non-economists, in a summary of experimental studies concerning 'take-some games'[7] Linder (1982) concludes that preplay communication seems to have a positive in-

---

[5] Bohm (1972) reports finding virtually no free riding at all, in a different type of experiment.

[6] Kim and Walker discuss five previous studies where free-riding was not supported in experiments. Not all of these studies are discussed here.

[7] A take-some game is a game where a common pool of money exists. Each participant can choose to take some of this money in a period. At the end of the period the pool is increased by a fixed percentage and a new round is played.

fluence on cooperative behavior. In Dawes, McTavish and Shaklee (1977) subjects in a uniform social dilemma game could either not communicate, only communicate about irrelevant matters, discuss the dilemma, or discuss the dilemma and make a public announcement about their choice (without a formal commitment) before they made their choices. In the last two conditions much more cooperation was observed than in the first two (70% vs 30%). The authors conclude that not communication as such, nor promises made, but the discussion itself is essential. The discussion helps participants understand the problems at hand.

Kramer and Brewer (1984) study the influence of a common 'social-group identity' on cooperative behavior in a 6-person take-some game. The level of group identity was manipulated by stressing the differences (low level) or similarities (high level) between the members of the group. A higher level of group identity enhanced cooperative behavior, especially when (false) feedback indicated that the common pool of money was being depleted. On the other hand, Bonacich (1972, 1976) found that an intragroup conflict (social dilemma) itself can enhance the group's cohesion and strengthen group norms. In his experiments subjects could communicate, but the decisions were anonymous.

Kramer and Brewer's result on the one hand and Bonacich's on the other seem to indicate that communication may increase group identity, yielding higher cooperative behavior (less free-riding). The Dawes et al. (1977) result shows that the communication must be on the dilemma at hand, however. Because the communication in his experiments was not structured, it is not clear whether group cohesion is also enhanced by communication about irrelevant matters in Bonacich's experiments.

All in all, the literature on intra-group conflicts has provided quite a few (sometimes contradictory) results. From these, the following are thought to be of interest for the study at hand. First of all, free riding appears to be a phenomenon that occurs, but probably not in the extreme sense that is assumed by rational choice theory. It may be added that a number of authors (e.g., Marwell and Ames, 1981) find that economists free ride more than other individuals. Second, cooperative behavior is positively affected by group identity. Third, pre-play communication has a positive effect on cooperative behavior. Finally, an increase in group size (or a decline in marginal return as a consequence of the increase) diminishes contributions.

The inter-group conflict constitutes a prisoners' dilemma. There appears to be a difference between individuals and groups playing this type of game: in general groups of individuals that have to make one common decision show less cooperation vis-à-vis each other than individuals facing each other in the same situation do (see Insko et al, 1987, for a review of the experimental literature). According to the 'altruistic-rationalization hypothesis' (McCallum et al., 1985) groups are more competitive because individuals in a group can rationalize their competitiveness towards the other group as having been enacted for the sake of fellow members. The 'group-schema hypothesis' is based on the effect of schemas.[8] In the context of intergroup relationships this hypothesis claims that when groups have to make common decisions, schemas are activated that create expectations about intragroup loyality and cooperation, and inter-group distrust and competitiveness. According to this hypothesis group cohesion will enhance inter-group competitiveness. On the other hand, inter-group conflict may enhance group identification and cohesion (Brewer 1979). Most experiments supporting this claim involve a group discussion, however, and it may be the case that not the group-membership but the discussion is essential in finding less cooperation between groups. Rabbie, Schot, and Visser (1989) argue that discussion enhances the rational and cognitive capabilities of the group and that groups are not necessarily more competitive than individuals, but more instrumental and rational.

Our conclusion from this part of the literature, is that any set-up that enhances within-group identification will diminish inter-group cooperation. Therefore, Pareto-optimality is not expected to arise from intra-group identification in a participation game.

As mentioned above, Bornstein (1992) analyzes the free-rider problem in a participation game setting where intra- as well as inter-group relationships play a role. Bornstein distinguishes individual, group, and collective rationality (the latter refers to Pareto optimality). This corresponds to the three types of

---

[8] The term 'schema' is used in the cognitive psychology to describe a set of beliefs or norms that individuals have learned to believe to be relevant in specific situations.

outcome we shall distinguish below. Two conditions are investigated: one with, and one without communication (cheap talk). The experiments are run as a one shot game with groups of three individuals. The results show some support for the free-riding hypothesis. Communication within groups decreases this behavior and moves results towards the group optimum. Communication between groups reduces contributions towards a Pareto optimum.

This concludes the review of a selection of the relevant literature. The conclusions that have been drawn allow one to derive testable hypotheses concerning the behavior of individuals in a turnout problem. A series of hypotheses will be derived in sections 4 and 5. These will be tested using data from our experiments. Therefore, first, the experimental design will be presented.

3. Experimental Design and General Results

Experimental Design

The (computerized) experiments were conducted in the laboratory of the Center for Research in Experimental Economics and Political Decisionmaking (CREED) at the University of Amsterdam. Subjects were recruited from the (undergraduate) student population of the University of Amsterdam. Players were asked to participate in an experiment concerning decisionmaking. They were told that the experiment would take about two hours and that they would generally earn something between 20 and 50 guilder, depending on their own decisions and those of other participants.[9]

Twelve sessions were organized in the period May 27 - June 12, 1992 and four more on December 9 and 10, 1992. A total of 210 subjects participated. Table 1 presents some descriptive statistics.

Table 1: Subject Characteristics

age:	*18-38 years old*, average *21.8* (standard deviation 2.8)
gender:	male: *76%*; female *24%*
major:	economics/econometrics: *59%*; other students: *35%*; missing: *6%*
employed:	yes (mostly parttime): *33%*; no: *65%*; missing: *2%*
participated in previous experiment:	yes: *39%*; no: *60%*; missing: *1%*

When asked for their motivation, *83%* of the subjects named making money as one of the reasons for participating in the experiment.

The subjects assembled in the reception-room of the laboratory and when settled down some preliminary instructions were read aloud. These gave the general set-up of the experiment: (1) the subjects would be randomly assigned tables; (2) one of the participants was randomly selected to be an observer in the experiment; his or her job was to ensure that the experiment was conducted exactly as stated in the instructions; (3) it was stressed that all decisions had to remain secret, no communication was allowed (in the lab, participants were unable to see each others' screens without the experimenter noticing it); (4) the subjects were told that they could make or lose money in the experiment; to compensate potential losses, they were paid a lunp-sum fee of *f* 15 or *f* 20 (depending on the parameter set) when entering the laboratory.

When every subject was seated, the computerprogram for the instructions and experiment was started.[10] Each subject, including the observer, could read the instructions (which includes comprehen-

---

[9] 1 guilder is worth approximately 0.5-0.6 American dollars and is denoted by a *f*.

[10] The software, written by CREED-programmer Otto Perdeck, is available upon request. The program, consisting of instructions and the experiment itself, is written in the language EASEL for an OS/2 environment.

sion tests) at her or his ease. Typically subjects took 25-35 minutes to finish the instructions. In all sessions the subjects were told they would play 20 periods. No practice trials were held. When everyone had finished the instructions a one-page summary was handed out.

For the experiment participants other than the observer were split into two teams, named yellow and blue. In sessions 1-12 each group consisted of 6 subjects. The way in which groups were composed varied. In sessions 1-4, the group-composition varied from period to period. The participants knew that the composition was never the same in any two periods. These first four sessions are labelled *mixed*, below. In sessions 5-8, the participants knew that the groups remained constant but did not know who was in which group. These sessions are labelled *blind*. In sessions 9-12, the table-number determined the allocation of groups. In these sessions everyone knew who was in which group, though all decisions remained secret, of course. To stress the openness of the group composition in these four sessions, the tables of the yellow (blue) group were marked by yellow (blue) balloons and all paper (for notes and handouts) was yellow (blue). These sessions are labelled *open*. Sessions 13 and 14 were designed to test the effect of unequal group size. The formation was undertaken as in *blind*, but in this case the yellow group consisted of eight and the blue group of six subjects. These sessions are labelled *blind-8x6*. Finally, sessions 15 and 16 were conducted to testfor a group size effect. In these cases, each group consisted of 14 subjects. Once again, the *blind* group composition was used. These are denoted by *blind-14x14*.

After the group composition had been arranged, the parameter-configuration for the session concerned was handed out. This determined the payoff structure. There were two configurations, one representing an election in a system of proportional representation (labelled *propres*) and one representing a winner-takes-all (*winall*) election. Each configuration was run twice in each of the group-conditions mixed, blind, and open. Only *winall* was used (twice) for *blind-8x6* and *blind-14x14*. Table 2 presents the distribution of group-conditions and parameter configurations over the 16 sessions.

Table 2: Condition and Configuration per Session

group-condition	mixed		blind		open		blind-8x6	blind-14x14
configuration	propres	winall	propres	winall	propres	winall	winall	winall
session	1&2	3&4	5&6	7&8	9&10	11&12	13&14	15&16

The subjects were given five minutes to study the configuration. Then the twenty periods were run. In each period, each participant had to decide to buy an imaginary disc or not. The price of a disc was common knowledge and equal for everyone. In propres a disc costs f 0.7. In winall the price is f 1. The players were payed a lump-sum start-off fee of f 15 in propres and f 20 in winall.

The number of discs bought in each group determines the payoffs. In *propres* the payoff to any group-member is equal to the number of discs bought in one's own group divided by the total number of discs bought times f 2.22. In *winall*, each member of the group that buys most discs receives a payoff of f 2.5 and the payoff for the other group equals zero. In case of an equal number of discs in both groups the observer randomly draws a yellow or blue ball from an urn (with a probability of ½ either way) to determine which group receives a payoff of 2.5. The parameter configuration of a session was handed out in a matrix form on paper and on the computer screen. Using the keyboard or mouse, subjects could light up rows or columns of the matrix to enhance readability. Table 3 shows the form in which subjects received the information in sessions 1 through 12 (two teams of six players each). The matrices for sessions 13-16 were straightforward extensions.

In the instructions it was made sure that participants understood how to read these matrices. In addition subjects were well aware of the fact that they received the payoff to their group irrespective of whether they bought a disc or not. To assure the participants that everyone was working with the same matrix, it was also projected on an overhead screen. Of course, the observer would be able to notice any deception in this way as well.

Table 3: Parameter Configuration

1. PROPRES

Costs for a disc: 70 cents:

Payoff matrix in cents:

		number of discs in the other group						
		0	1	2	3	4	5	6
number of discs in your group	0	111	0	0	0	0	0	0
	1	222	111	74	55	44	37	32
	2	222	148	111	89	74	63	55
	3	222	167	133	111	95	83	74
	4	222	178	148	127	111	99	89
	5	222	185	159	139	123	111	101
	6	222	190	167	148	133	121	111

2. WINALL

Costs for a disc: 100 cents:

Payoff matrix in cents:

		number of discs in the other group						
		0	1	2	3	4	5	6
number of discs in your group	0	0 or 250	0	0	0	0	0	0
	1	250	0 or 250	0	0	0	0	0
	2	250	250	0 or 250	0	0	0	0
	3	250	250	250	0 or 250	0	0	0
	4	250	250	250	250	0 or 250	0	0
	5	250	250	250	250	250	0 or 250	0
	6	250	250	250	250	250	250	0 or 250

The screen of each participant keeps track of the results. It gives the period number, the group allocation of the individual in that period, the decision to buy or not, the number of discs bought in each group, the payoff to each group, and the individual's personal earning in the period. The latter is equal to the group payoff if (s)he did not buy a disc and equal to the group payoff minus the price of a disc in case (s)he did. These results are displayed for the most recent 4 periods, and participants can easily scroll back to earlier results.

The 20 periods of the experiment generally took about 30 minutes. In *open* and in *blind-8x6*, after 20 periods the experimenter in the laboratory said that this was the end of the first part of the

experiment. The participants were told they would be allowed to communicate within their group for 5 minutes. After 5 minutes no communication was allowed anymore, and 5 more periods were played.

After 20 or 25 periods, the subjects were asked to remain seated and questionnaires were handed out. A translation of the questionnaire is available upon request. The general structure is as follows. It consists of 4 parts. The first part (6 questions) concerns the instructions, e.g. were they clear, and did the subject use the one page summary of the instructions handed out. The second part (26 multiple choice questions and 3 open questions) is dedicated to the decisions made by the subject. It concerns, for example, the considerations while making choices, and the extent to which the subject perceives her or his earning dependent on the choices of other participants. The third part contains more general questions about the experimental situation (17 multiple choice and 1 open question), e.g., whether the subject was satisfied with his/her earnings and questions about the use of the computer. The final part of the questionnaire concerns individual characteristics of the subject, like age, gender, and major.

The questionnaire included some open questions, especially about the subjects' considerations when making their choices. These questions are asked early in the questionnaire, in order to avoid having subjects influenced by the ideas of the researchers, as revealed in other questions asked later on. The answers to these questions are coded into categories.

It generally took the subjects 5-15 minutes to fill out the form. The reason for using such an extensive questionnaire is twofold. First of all, it can give us useful information on how subjects experienced the experiment itself. Second, the results of the questionnaire may help to derive hypotheses about individual choice for future testing. It is realized that reservations should be made with respect to the use of stated preferences and motivations for certain choices, especially when the statements are made after the result of their choices is known to the subjects. However, in some cases the statements may reveal an individual's attitude towards the group, for example (cf. section 5).

After everyone had finished the questionnaire, subjects were asked into the reception room one by one and paid. Anyone that had lost money (only one subject in all 16 sessions) had to pay back part of the money paid at the start of the experiment. The total duration of the experiment from the reading of the first instructions to the paying of the last subject generally took just over an hour and a half and never took more than 2 hours. Including delays at the start of the experiment, no subject ever spent more than 2 hours and 20 minutes on the experiment.

The subjects appear to have understood the instructions. The comprehension questions had to be answered correctly, and answers in the questionnaire showed that the instructions were thought to be clear. Nothing in the individual decisions seems to show that subjects might not know what they were doing.

The sessions generally took place as planned and without problems. An exception is formed by the two sessions in which the experiment was run with teams of 5 individuals per group instead of 6 (*winall* sessions 3 and 12). In addition, four times, a software problem occured that potentially could affect results. In session 7, the data concerning period 8 were lost. A short break was taken to solve the problem. Individuals were asked to restate their decisions of period 8 at the end of the session.[11] Using this information, the results for period 8 were reconstructed. In session 9, one of the computers lost contact with the local area network, and a restart-program taking about 5 minutes had to be run. In session 15 the restart program had to be used again. In session 16 the same problem occurred after period 19, and the experiment was stopped. None of these problems is expected to have had an effect on the results.

A potentially more important problem concerns the difference between the group conditions *blind* and *open*. The idea is, that individuals do not know who their co-members are in *blind*. After the random draw of a group, individuals had to type in their color on the keyboard. Some participants let us know after the experiment that they had known which group their neighbors belonged to because

[11] This restatement had no effect on payoffs. For period 8 the aggregate result was known. Therefore, it was known which team had won 2.5 guilder. For this period payoffs were made net of costs (i.e., irrespective of the decision to buy or not). Participants knew this when they restated their decision of period 8. The aggregate result of the 'restatement' corresponds to the original aggregate result.

they had heard the number of keys typed ('blue' has one letter more than 'yellow', in Dutch). Though this might have a slight effect on difference between *open* and *blind*, it seems safe to assume that the latter has a more anonymous group composition than the former.

General Results

The appendix to this paper presents all of the results of the 16 sessions. The aggregate results are presented in figures 1, 2, and 3, which show the five-period-average 'turnout rate' (number of discs bought divided by the number of participants) for each session. Figure 1 gives the results for the *propres* configuration for the various group conditions (sessions 1,2,5,6,9,10).Figure 2 presents the corresponding results for *winall* sessions 3, 4, 7, 8, 11, 12). Figure 3 compares the *blind-winall* results in the conditions 6x6, 8x6, and 14x14 (sessions 7, 8, 13, 14, 15, 16). A first glance at these figures indicates that (1) turnout seems higher in winall than in propres; (2) turnout declines towards the end of a session; (3) turnout in *mixed* is lower than in *blind* or *open*; and (4) the 8x6 and 14x14 conditions do not seem to differ much from the 6x6 condition. Of course, these assertions will be tested more thoroughly, below.

Figure 1: Turnout Rates for PROPRES

	1-5	6-10	11-15	16-20	21-25
open 10	37%	32%	13%	32%	55%
open 9	38%	27%	25%	25%	25%
blind 6	35%	47%	37%	20%	0%
blind 5	20%	30%	13%	30%	0%
mixed 2	28%	22%	30%	23%	0%
mixed 1	18%	27%	22%	25%	0%

A different way of summarizing the results is at an individual level. Table 4 (first row) presents the average number of discs bought per individual, in the various condition/configuration combinations. This table enables comparisons of results in various conditions, to be undertaken when testing hypotheses in sections 4 and 5. Thus, much of our statistical analysis will take place at an individual level (as opposed to a session-level). This is a consequence of the fact that most of the research questions and hypotheses we have are at the individual level. Because the observations in any one session are not completely independent (the choices of 'other' participants may vary sytematically over sessions), one needs to test and correct for a 'session-effect'.[12] No such effect could be distinguished in the data.

[12] One could avoid problems by having subjects, unknowingly, play against programmed strategies. This has other disadvantages, of course.

Figure 2: Turnout Rates for WINALL

	1-5	6-10	11-15	16-20	21-25
open 12	40%	42%	38%	28%	100%
open 11	57%	47%	28%	22%	53%
blind 8	50%	53%	67%	37%	0%
blind 7	57%	48%	35%	25%	0%
mixed 4	45%	35%	35%	27%	0%
mixed 3	26%	28%	16%	12%	0%

	1-5	6-10	11-15	16-20	21-25
14x14 16	44%	36%	27%	24%	0%
14x14 15	55%	35%	44%	29%	0%
8x6 14	47%	46%	37%	34%	61%
8x6 13	49%	44%	34%	30%	54%
6x6 8	50%	53%	67%	37%	0%
6x6 7	57%	48%	35%	25%	0%

Table 4: Average Number of Discs and Average Earnings per Individual

group-condition	mixed		blind		open		blind-8x6	blind-14x14
configuration	propres	winall	propres	winall	propres	winall	winall	winall
number of discs per i	4.88	5.73	5.79	9.29	5.71	7.55	8.08	7.36[a]
earnings per i[b]	18.79	19.27	18.15	15.71	18.20	17.58	16.93	17.18

[a]The average number in session 16 was corrected for the fact that only 19 periods were played.
[b]Net of start-off fee.

As for earnings, over the first 20 periods[13] the net earnings in *propres*, excluding the *f* 15 subject received at the start, was between *f* 10.28 and *f* 25.57, with an average of *f* 18.38. For *winall* the subjects started off with *f* 20 and the net earnings were between -*f* 0.30 and +*f* 39,00, with an average of *f* 17.26. The average earnings for the various group conditions are presented in the second row of table 4.

Table 5: Earnings and Number of Discs Bought
(excluding start-off fee of *f* 15 / *f* 20)

# discs	PROPRES		WINALL	
	# cases	average earning	# cases	average earning
0	9	22.11	11	24.77
1	4	23.00	5	23.00
2	6	18.68	9	23.28
3	6	20.30	9	15.61

20	-	----	2	6.25
	Pearson's R: -0.67		Pearson's R: -0.41	

[13]Note that the participants in the sessions concerned did not hear about the additional five periods until after period 20 had been played.

To get an impression of the relationship between the number of discs bought and the earnings, table 5 presents the average earnings in both parameter configurations for various numbers of discs bought. The table shows a negative relationship between earnings and number of discs (stronger for *propres* than for *winall*), as was to be expected, though monotonicity is not obvious.

These general results only serve to provide a first impression of the results of the experiments. We now turn to a more systematic analysis of theories of individual behavior for the setting described. The theory will then be confronted with the data obtained.

4. Models of Individual Behavior

In this section, two types of models of individual behavior will be discussed. First, a formal game-theoretic analysis of the situation at hand will be presented. The equilibria to be derived will be tested using the data obtained from the experiments described. A distinction is made between a static and a dynamic interpretation of the game at hand. The second type of model concerns a (less formal) description of learning process that a participant might go through in the experiments.

The structure in which theories are analyzed in this and the next section is as follows. First, a general description of the theory is presented. Next, the theory is formulated as a hypothesis in general terms. This is then elaborated to make it testable using the experiments. It will become clear that one general hypothesis (e.g., hypothesis 1) may be elaborated to various testable hypotheses (e.g., 1a-1e). The elaborated hypotheses are tested and conclusions are drawn. Rejection of a hypothesis may indicate that the general hypothesis is wrong, or that the elaboration is wrong. In these cases, and in case of acceptance of a hypothesis, an explorative discussion of the implications of the results will be presented.

In elaborating and testing the hypotheses put forward in this paper, the following *notation* will be used. The variable x_{it} is a 0-1 dummy that is equal to 1 if individual i buys a disc in period t and 0, otherwise. The total number an individual buys in 20 periods is denoted by $X_i = \Sigma_t x_{it}$. From the point of view of i, the group (s)he belongs to is denoted by I, the other group by II. The probability $p_{it} = \text{Prob}\{x_{it}=1\}$. The total number of individuals *other than i* who buy a disc in group I in period t, is denoted by n^I_{it}, the turnout in group II by n^{II}_{it}. Total turnout in period t is equal to $x_{it}+n^I_{it}+n^{II}_{it}$, turnout in a group is denoted by n_t.

4.1. Static Game Theoretic Equilibria

For the parameter configurations described in table 3, various types of (Nash-)equilibrium can be derived. One can distinguish static (one shot) equilibria from dynamic equilibria for the complete 20 periods of an experiment. In addition, a distinction can be made between equilibria at the level of individuals and equilibria at the level of groups. Finally, one must determine whether complete information concerning the payoff functions of fellow players is a reasonable assumption or not. Note that for both *propres* and *winall* the Pareto optimal situation is for no one to vote.[14]

Assuming complete information, at an *individual* level, both pure and mixed strategy equilibria will be determined. In the latter case, only totally quasi-symmetric equilibria are investigated (cf. Palfrey and Rosenthal, 1983), where all voters in one group are assumed to vote with the same probability. Randomly labelling our two groups I and II, we denote the probability of any individual in I (II) voting by p (q). Assume n (m) members in group I (II). Furthermore, denote the (n+1, m+1) matrix defining the benefits from an election result for an individual in I by A (cf. table 3, for examples). Due to symmetry, A^T presents the benefits for an individual in II. Finally, the costs of voting are assumed equal for everyone and denoted by c.

To start with the pure strategy equilibria for the games determined by Table 3, it can easily be seen that for *propres*, all (36) situations where one participant in each group votes constitute a Nash

[14] The various situations will be described using terminology referring to voting instead of buying discs.

equilibrium. In *winall* only the situation where everyone votes represent a Nash equilibrium in pure strategies in the 6x6 or 14x14 games. In the 8x6 game, no Nash-equilibrium in pure strategies exists.[15]

Turning to equilibria in mixed strategies, for a member of I, the expected value of voting or not voting depends on the number of other individuals i in I, and the number of individuals j in II casting a vote. The probability of i and j occurring for group size n,m can be denoted by Pr_{ij}^{nm}. For notational convenience, the superscripts n and m will be dropped. Given i and j voters in I and II, the benefit from voting is:

$$A[i+1, j] - c .$$

The benefit from not voting is:

$$A[i, j] .$$

Given the probabilities Pr_{ij}, this yields the expected benefit to be obtained from voting as opposed to abstaining:

$$E_{vote} - E_{abstain} = \sum_{i=0}^{n-1} \sum_{j=0}^{m} Pr_{ij} \cdot (A[i+1, j] - c - A[i, j]) , \tag{1}$$

where

$$Pr_{ij} = \binom{n-1}{i} \cdot p^{i} \cdot (1-p)^{n-i-1} \cdot \binom{m}{j} \cdot q^{j} \cdot (1-q)^{m-j} .$$

For any matrix A, a mixed equilibrium strategy for an individual in I will occur, if:

$$E_{vote} - E_{abstain} = 0 . \tag{2}$$

The set (p,q) constitutes an equilibrium if eq. (2) holds and q is an equilibrium strategy for any voter in II.[16] The latter requires:

$$\sum_{i=0}^{n} \sum_{j=0}^{m-1} Pr_{ij}^{*} \cdot (A^{T}[i, j+1] - c - A^{T}[i, j]) = 0 , \tag{3}$$

where

$$Pr_{ij}^{*} = \binom{n}{i} \cdot p^{i} \cdot (1-p)^{n-i} \cdot \binom{m-1}{j} \cdot q^{j} \cdot (1-q)^{m-j-1} .$$

Solving eqs. (2) and (3) yields the mixed strategy equilibria for the games constituted by various values

---

[15] We are assuming that risk attitudes ar such, that an equal probability of earning f 1,5 or losing f 1 is preferred over a sure profit of f 0.

[16] Note that eqs. 2 and 3 are a generalization of eqs. 11 and 12 in Palfrey and Rosenthal (1983).

of m and n. In our cases, (m,n) = (5,5), (6,6), (8,6), and (14,14). Before presenting the solutions, which have been determined numerically, we determine the solutions for groups as a whole.

The groups as a whole play a game of two players with m+1 and n+1 strategies, respectively (from zero voters to m or n voters). The payoff matrix B for group I in this game consists of the elements:

$$B[i, j] = n \cdot A[i, j] - i \cdot c \ , \ i = 1, \ldots, n, \ j = 1, \ldots, m \ .$$

For group II, the payoff matrix is given by:

$$B^T[i,j] = m \cdot A^T[i,j] - j \cdot c \ , \ i = 1, \ldots, n, \ j = 1, \ldots, m \ .$$

A pure strategy for I (II) consists of having i (j) members vote and n-i (m-j) abstain. A mixed strategy for group I (II) consists of probabilities p_i, i=0,...,n, (q_j, j=0,...,m), with:

$$\sum_{i=0}^{n} p_i = \sum_{j=0}^{m} q_j = 1 \ . \qquad (4)$$

For groups as a whole, we only look at pure strategy equilibria, the case for mixed strategies is straightforward, but will not be needed in the analyses to be undertaken.

For the parameters used, at an individual level the mixed strategies are all symmetric, i.e. p=q, in the (n,m) = (5,5), (6,6) and (14,14) cases. Table 6 summarizes the game theoretic predictions for our experiments.

Table 6: Static Game Theoretic Equilibria[a]

	Pareto-optimum	Individual-level		Group-level
		pure strategies	mixed strategies (p, q)	pure strategies
propres	0 0	1 1	(0.098, 0.098)	5 5
winall (5x5)	0 0	5 5	(0.064, 0.064) (0.936, 0.936)	5 5
winall (6x6)	0 0	6 6	(0.051, 0.051) (0.949, 0.949)	6 6
winall (8x6)	0 0	----	(0.037, 0.050)	----
winall (14x14)	0 0	14 14	(0.019, 0,019) (0.981, 0.981)	14 14

[a]The numbers in the cel represent the total number of voters in each group for the Pareto optima and pure strategies. For mixed strategies, the equilibrium probability of voting (equal for both groups) is given.

Table 6 shows that the pure strategy individual-level equilibria are completely different for *propres* and *winall*. In the former case turnout is very low, in the latter it is 100% for the symmetric cases, whereas no pure strategy equilibrium exists for the 8x6 configuration. Note that the pure strategy equilibria for *propres* would seem to be very difficult to arrive at, due to coordination problems as to which indivi-

dual in each group should vote (there are 36 of these equilibria). The mixed strategy individual-level equilibria make low turnout possible in equilibrium in both cases. At the group level high turnout is the equilibrium for both matrix configurations, except the asymmetric *winall* case, where no pure strategy equilibrium exists. Note that the Pareto optimal zero turnout is never an equilibrium. Using these equilibria, a number of hypotheses based on the literature discussed in section 2 will be examined in section 5. Here we focus on the matter whether the static game theory described provides an adequate description of behavior in the experiments. We start with the first hypothesis in general terms.

HYPOTHESIS 1: *In the absence of group-identification, turnout will correspond to individual-level game theoretic equilibria.*

This general hypothesis refers to the static as well as the dynamic case. The former will be tested in two forms, the first more strict than the second. Because the group condition *mixed* should exclude the possibility of group identification and does not constitute a repeated game, the decisions made there are related to the equilibria predictions in table 6. Of course, we have to deal with the various configurations and conditions described in the table. In addition, both pure and mixed strategies are possible. Though the coordination problems for the pure strategies in *propres-mixed* are immense, the first version of the hypothesis simply predicts that one of the equilibria will be found. The second version is far less strict: it compares the predicted outcomes in various conditions in a comparative static manner. If it is assumed that pure strategies are played, the number of discs bought in *winall* is expected to be larger than in *propres*. If mixed strategies are assumed, individual behavior over 20 periods must be in accordance with the probabilities constituting the strategy.

HYPOTHESIS 1a: *In mixed, n_i corresponds to a pure strategy equilibrium in table 6 or $X_i/20$ corresponds to a mixed strategy in table 6.*

HYPOTHESIS 1b: *In mixed, X_i is larger for winall than for propres.*

Results

Remember, to avoid repeated game properties, the static equilibria have only been looked into, for the group-condition *mixed*. First consider hypothesis 1a. As far as pure strategies are concerned, the individual-level equilibrium of 1-1 for *propres* was obtained in only 6 out of 40 rounds, and never two rounds in succession. The *winall* pure strategy equilibria of 5-5 (session 3) and 6-6 (session 4) were never found. The mixed strategy equilibria were investigated using individual participation records. The number of discs bought by an individual, X_i has a binomial distribution with parameters 20 (number of periods) and p (probability of buying a disc). Hypothesis 2a implies that $p=0.098$ for *propres*, $p=0.064$ or $p=0.0936$ for *winall 5*, and $p=0.051$ or $p=0.949$ for *winall* . This yields 95% confidence intervals for the number of times a disc is bought: [0,5] for *propres*, [0,4] and [16,20] for *winall 5*, and [0,3] and [17,20] for *winall*. In *propres*, the participation of 13 of the 24 subjects stays within this interval. For *winall 5*, 5 out of 10 act in accordance with the lower interval and no individual buys 17 discs or more. For *winall*, 1 out of 12 act in line with the lower interval and no individual buys 16 discs or more. Aggregating over individuals, the average number of discs bought differs significantly from the mixed strategy equilibrium in each of the three parameter configurations used.

Hypothesis 1b compares the number of discs bought in *propres* and *winall* in *mixed*. In the former configuration, on average 4.88 discs are bought, in the latter 5.73. This difference is as expected, but not statistically significant, using a t-test. The hypothesis is not rejected by the data.

All in all, the support for static game theory as a model of individual behavior in our experiment is only partial. Only the comparative statics of 1b are supported. It may be added that the same conclusion holds, if tests are carried out for the last 10 periods of each session only. Of course, the symmetry assumed may be too restrictive. We return to this point in section 4.4, after other models of individual behavior have been discussed.

4.2. Dynamic Aspects of the Game

If behavior is analyzed in the setting of a dynamic (repeated) game, there are two versions that could be relevant for the present case. Which version is chosen depends on the assumptions made concerning the information individuals have. In the static analysis above, complete information on other players' payoffs was assumed. In a repeated game, complete (but imperfect) information implies that a subgame perfect Nash-equilibrium is the appropriate concept to use[17]. This is discussed below. On the other hand, people may have incomplete information concerning the payoffs of others, for example where positive utility is derived from the act of contributing per se, but one does not know how much utility is derived by other participants. The dynamic game of incomplete information then arrived at will be analyzed below. Note that we do not discuss the static case of incomplete information. Using the analysis below, this is straightforward, however.

Repeated Game with Complete Information

The difference between a series of static (one-shot) games and a repeated game is that in the former case players attempt to achieve a maximum payoff, given the strategies of other players, in each period. In the repeated game, however, a maximum payoff for all periods together is sought. Threats and promises about future behavior can affect current behavior. Of course, these threats need to be credible. This is the case as long as they are not on conflict with Nash-behavior in any subgame. Formally, a subgame-perfect Nash equilibrium is a Nash equilibrium for the dynamic game if the players' strategies constitute a Nash equilibrium in every subgame. It can be shown that a repetition of the pure strategy-equilibria derived above for *winall* and *propres* are subgame perfect Nash equilibria for these participation games. There may be many more, of course, but here we focus on these most straightforward ones. Therefore, hypothesis 1 can easily be elaborated to apply to the dynamic case of complete information.

Naturally, we cannot simply refer to the results for hypothesis 1. This was tested using the *mixed* condition, which does not constitute a repeated game. In addition, the group-condition *open* may be a bit tricky because it was specifically designed to enhance group identification. Therefore, we adapt the hypothesis for the condition *blind*. This then simply reads that the results in periods of the repeated game are static Nash-equilibria. It should be noted that, in theory, subgame-perfect Nash equilibria could exist, in which the outcome of a period is not a Nash-equilibrium. This can occur when multiple static equilibria exist for the stage game. The complexity of our cases, where only one of the multiple equilibria is in pure strategies, makes it unlikely that individual participants will behave in this manner. We therefore restrict the analysis to repetitions of the (same) static equilibria.

HYPOTHESIS 1c: *In blind, n_i corresponds to a pure strategy equilibrium in table 6 or $X_i/20$ corresponds to a mixed strategy in table 6.*

HYPOTHESIS 1d: *In blind, X_i is larger for winall than for propres. X_i is larger in blind-14x14 than in blind (winall).*

Once again, the second version is based on pure strategies only, and is no more than a comparative analysis between conditions.

Results

To test 1c, we once again count the number of pure strategy equilibria arrived at, and compare individual track records to the binomial confidence intervals for mixed strategies. In *propres*, 3 times out of 40, a (1,1) equilibrium was arrived at, and this was never repeated in the next period. Only 11 out of 24 subjects bought discs in accordance with the lower interval (less than or equal to 5 discs) whereas none bought in accordance with the higher interval (more than or equal to 16). For *winall*, the pure strategy equilibria (6,6) or (14,14) were never obtained. The intervals for the 6x6 condition are

[17] For a useful explanation of the role of information and various equilibrium concepts, see Gibbons (1991).

once again [0,3] and [17,20]. The former was kept to by 2, the latter by 1 out of 24 individuals. The 95%-confidence intervals for the 14x14 condition are [0,2] and [18,20]. 13 of the 56 subjects stayed in the first interval, 2 of the 56 stayed in the second. For the 8x6 condition, the confidence interval for the group of 8 is [0,3], for the group of 6 it is [0,4]. 3 out of 16 participants adhered to the former, 2 out of 12 to the latter.

As for 1d, both elements are supported by the data. In blind (6x6), 9.29 discs were bought on average in *winall*, whereas 5.79 were bought on average in *propres*. The difference is statistically significant at a 1% level. The numbers for *blind-winall-6x6* and *blind-winall-14x14* are 9.29 and 7.36, respectively. The corresponding t-test has a p-value of 0.085.

All in all, like the static case, only the comparative statics implied by the dynamic game theory assuming complete information are supported. Once again, this may be a consequence of the fact that we have elaborated the general hypothesis for the symmetric case only (cf. section 4.4).

Repeated Game with Incomplete Information

The assumption of complete information about other participants' payoffs is more restrictive than it may seem at first sight. It assumes that every player is only concerned with the monetary payoffs provided by the experimenter. Moreover, it implies that everyone knows, that everyone knows (etc.), that every player is only concerned with these monetary payoffs. If non-monetary rewards to contributing to a group goal exist, however (people might just feel good about doing something nice for someone else) or if people only think that they may exist, the assumption of complete information needs to be changed.

To investigate the effects, assume that non-monetary awards are added to the monetary payoffs of participants. These rewards may be due to a feeling of altruism (Palfrey and Rosenthal, 1988) or giving in to social norms like 'civic duty' (Schram and van Winden, 1991), for example. The formal incorporation of these rewards below will be similar to the altruism model by the former.[18] They rightfully stress that there are two effects following the introduction of these non-monetary rewards. First of all, a trivial consequence of a higher reward attributed to ones own contribution is that one is more likely to participate. This is not the interesting consequence, however. The second consequence worth studying, is that uncertainty concerning altruism of other participants yields different behavior (and different equilibria) than in case of complete information.

In the context of the present paper, the non-monetary rewards are incorporated in the analysis by adding a parameter d_i (for 'duty') to eqs. (1) and (3). Given the results in Table 6, that in the static game for groups of equal size, mixed strategies were found to be equal across groups, we restrict attention to symmetry within and between groups: everyone has the same probability of participating. Thus, the analysis that follows does not hold for the *blind-8x6* condition. An extension to asymmetric cases is straightforward, however.

For the symmetric cases, we only need to adapt (1), which now reads:

$$E_{vote} - E_{abstain} = \sum_{i=0}^{n-1} \sum_{j=0}^{m} Pr_{ij} \cdot (A[i+1, j] - A[i, j] + d_i - c) \; . \qquad (1')$$

Note that if $d_i > c - \min \{A[i+1,j] - A[i,j]\}$, the individual will always vote, and if $d_i < c - \max \{A[i+1,j] - A[i,j]\}$, (s)he will always abstain. These are individuals whose sense of duty is so high or low that a dominant pure strategy exists. Here, we focus on intermediate cases.

A perfect Bayesian equilibrium for this game consists of strategies and beliefs (concerning the levels of

---

[18] Palfrey and Rosenthal (1988) apply their analysis to voluntary provision of public goods games. They derive a Bayesian Nash Equilibrium, i.e., no intertemporal behavior (including Bayesian updating) is investigated.

altruism of other participants) that satisfy (roughly speaking):[19] (1) each player maximizes expected payoffs, given her or his beliefs and the strategies of others; (2) beliefs are updated using Bayes' rule. The latter requirement is very tricky in the game at hand. Because participants have no feedback concerning other participants' behavior at an individual level, Bayesian updating would necessarily concern some aggregate measure concerning the altruism of others. Assume that this aggregate measure determines the distribution function of d_j, $j \neq i$, as individual i believes it to be. The turnout observed then provides information concerning the value of this measure. There are now two possibilities.

First of all, i may believe that her or his altruism stems from the same distribution. In this case, i (assuming (s)he knows d_i) has more direct information concerning the altruism distribution and it is not clear how (s)he should use both types of information optimally. The second case is where i believes that her or his altruism contains no information with respect to the altruism of other participants. Because d_i is relevant for the beliefs of others, this yields a complex system of interrelated beliefs about the distribution of altruism of 'the others'.

In both cases, optimizing rational individuals will be forward looking in the sense, that they will take account of the fact that their behavior will not only affect the behavior, but also the beliefs of other players. This adds yet another complexity to the perfect Bayesian outcome. Given all these complexities, we shall not set out on a quest for the perfect Bayesian outcome.[20] Instead, two simplifying assumptions will be made. First, players are not assumed to be forward looking, in the way described. A participant is assumed to maximize payoffs, given beliefs, without taking account of the possibility of affecting future beliefs. Second, it is assumed that players disregard their own altruism when updating their belief about the distribution of altruism on the basis of observed behavior. As mentioned above, a final characteristic of the analysis is that only symmetric equilibria are under investigation. This point will be discussed in section 4.4.

Focusing on symmetric equilibria, strategies consist of equal participation probabilities for both groups, (p^*,p^*), and beliefs concerning the distribution of altruism are shared equally by everyone. Following Palfrey and Rosenthal (1988), an equilibrium to the game can be characterized by a cutoff-point d^*, (equal for all individuals), such that individual i will vote if $d_i > d^*$, abstain if $d_i < d^*$ and be indifferent if $d_i = d^*$. This can be seen from eq. (1') by noting that one individual with a mixed strategy and $d_i = d^*$ implies that people with lower d_i have $E_{vote} < E_{abstain}$ and people with higher d_i have $E_{vote} > E_{abstain}$. The symmetric mixed strategy equilibria (p^*,p^*) can now be derived from (1'). The equilibrium strategies will depend on d^*.

The value of d_i for other individuals represent incomplete information for the participants. It is assumed that each player has an idea as to the distribution of d_i accross individuals; this is represented by the distribution function $F_\mu(d)$. It is assumed that this function is known to the individual up to its mean μ. In any period of the game, individuals are assumed to have a belief concerning the value of μ. This belief represents the incomplete information aspect of the game. As the individual gathers more information about choices by other participants this belief is updated using Bayes' rule. Given our definition of (p^*,p^*) as equilibrium parameters and d^* as cutoff-points, we have:

$$p^* = 1 - F_\mu(d^*) \ . \qquad (5)$$

Note that the same distribution function F_μ is assumed for both groups. It would mean a straightforward extension to the analysis to let the function vary.

Next, we make use of the fact that at the cutoff-points d^* an individual is indifferent between voting and abstaining, i.e., the expected benefit of both is equal (eq. 2). From (1') it can be derived:

---

[19] For a more formal definition, see Gibbons (1991, 177-180).

[20] The complexity of an analysis provides two arguments for not undertaking it. First, in models of individual behavior, participants are assumed to (explicitly or implicitly) be able to do the reasoning needed. If they are not able to do so, there is no need to do it as a researcher. Second, the analysis may be too complex for the researchers to undertake. In this case, both arguments apply.

$$d^* = c - \frac{1}{(n-1)\cdot m} \cdot \sum_{i=0}^{n-1} \sum_{j=0}^{m} Pr_{ij} \cdot (A[i+1, j] - A[i, j]) \ , \qquad (6)$$

where Pr_{ij} is given as a function of p and q(=p) below eq. (1).

Together, eqs. (5) and (6) constitute two equations for the unknown variables p and d*, if F_μ is known. In any static game, this (Bayesian) Nash equilibrium can be solved. In a dynamic setting, one needs to address the updating of beliefs. We shall not do so formally, but restrict attention to comparitive statics that follow from this updating.

To start with, simply assume that μ is updated because of observed behavior. The effect of this change in μ on the equilibrium value of p can be derived by substituting (6) in (5) and totally differentiating:

$$\frac{dp^*}{d\mu} = \frac{-\frac{\partial F}{\partial \mu}(d^*)}{1 + f_\mu(d^*) \cdot G(p^*)} \ , \qquad (7)$$

where:

$$G(p) = \frac{1}{(n-1)m} \sum_{i=1}^{n-1} \sum_{j=1}^{m} \frac{\partial Pr_{ij}}{\partial p}(p) \cdot (A[i+1,j] - A[i,j]) \ .$$

Using the definition of $Pr_{ij}(p)$, it can be derived that:

$$\frac{\partial Pr_{ij}}{\partial p} = \frac{i+j-(m+n-1)p}{p(1-p)} \cdot Pr_{ij}(p) \ .$$

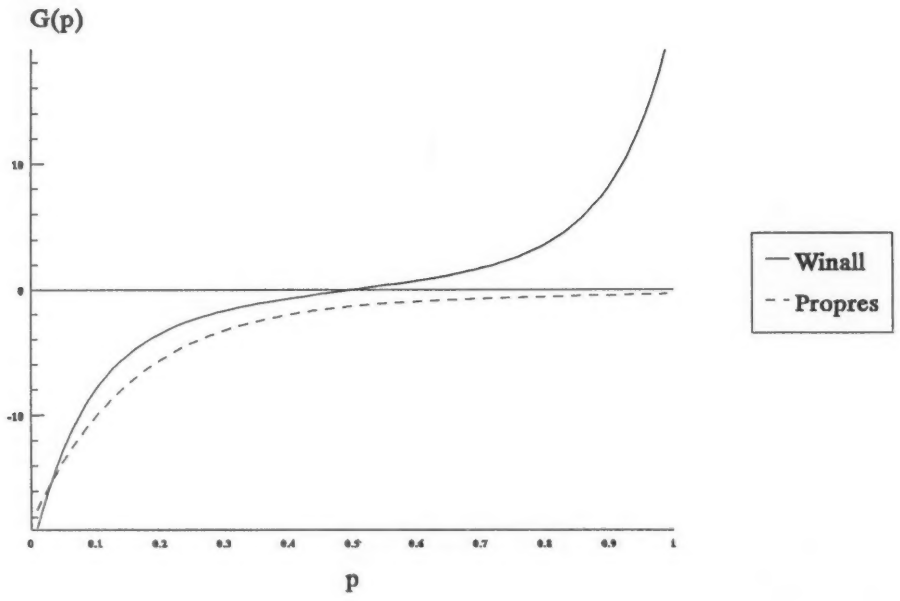
In (7), f_μ represents the density function of μ. Furthermore, for any d, the value of the distribution function declines if μ increases, so the numerator is positive. Therefore the sign of the change in the equilibrium value of p following an updating of μ is determined by the sign of the denominator. Given that $f_\mu > 0$, a sufficient condition for p to move with μ is that $G(p) > 0$. The value of G(p) is plotted for *winall* and *propres* (for m=n=6) in figure 4. This shows that G(p) is a monotonically increasing function in both cases, and is larger than 0 for $p > 0.5$ for *winall* (the same holds for the 14x14 case of winall), but $G(p) < 0$ for *propres*.

The final step to take is to determine the sign of $d\mu$, i.e., in what direction μ is updated. We wish to do so for a general case, without specifying the distribution F. The value of μ will decline if individuals are confronted with unexpected low turnout, and will increase if turnout is unexpected high. The higher an observed turnout is in any given period, the more likely that it will be unexpectedly high, and therefore the more likely it is that μ will be adapted upwards. Moreover, from the previous paragraph, we know that a sufficiently high equilibrium value of p* will mean that the upward movement in μ will be followed by an upward movement in p*, at least for *winall*, where $p^* > 0.5$. This heuristic reasoning yields the only testable elaboration of hypothesis 1 that we derive from the analysis.

HYPOTHESIS 1e: *In winall, in the blind conditions 6x6 and 14x14, a turnout higher than or equal to 50% will, on average, be followed by a higher turnout.*

The term 'on average' has been added, because an increase in turnout probability for every participant need not always yield a higher turnout. Unfortunately, turnout rates of over 50% were rare in our experiments. In the 6x6 case, 21 turnouts (out of 40) were equal to, or over 50%. In 4 cases turnout was higher in the next period, in 4 cases it remained equal, and in 13 cases it declined. For the 10 (out of 39) cases with turnout $\geq 50\%$ in the 14x14 configuration, 2 times an increase, 2 times no change, and 6 times a decline was observed. These figures are in contradiction with the hypothesis.

Figure 4



4.3. Learning behavior

The game theoretic models of individual behavior described above focus attention on the 'ideal' rational participant, and enable one to confront her behavior with that of experimental subjects. A completely different approach starts at the other end, and tries to find out what subjects are actually doing in the experiment. Once this has been established, this behavior may be confronted with the 'ideal' behavior. Typically, this alternative approach assumes that the rationality of participants is bounded in some way.

It is reasonable to assume that a subject will make the decision (s)he thinks is best, given her or his beliefs and expectations about the situation and the behavior of the other subjects in that situation. If these beliefs and expectations are not in line with the model being studied or with the game theoretic assumption that all participants are rational, and that this is common knowledge, game theoretic predictions will not be confirmed by the data from the experiments. However, if a game is played repeatedly, subjects can learn from their experience.

This learning can take on various forms. Here, we focus on a set-up presented by Selten (1991), where three kinds of learning are distinguished. In this analysis, the term 'learning' refers to the way in which an individual adapts her or his behavior as a consequence of experiences.

1 *Rote learning*: choices that led to success (failure) are repeated (abandoned). Note that in this case, no insight in the strategic situation the individual is confronted with is necessary. One might say that an extreme form of stimulus-response behavior is assumed.

2 *Imitation of successful others*: In this case, the horizon of an individual is expanded beyond the personal experiences to look for other indications of what the 'optimal' behavior might be.

3 *Belief learning*: experiences in a situation are used to strengthen or weaken beliefs about the situation one is confronted with.

Necessary conditions for learning to take place are a stable environment and reliable information about choices and results in previous rounds. These conditions are fulfilled in the present experiments;

subjects received clear information about previous rounds and the game itself did not change during a session. However, the environment was not completely stable; results depend on the behavior of other participants, which may (and typically did) change in the course of a session. Moreover, in the mixed condition the situation was less stable because the composition of the groups changed every period; nothing specifically could be learned about the behavior of the blue or yellow group in this case. Therefore, we distinguish the following general hypothesis, that will be elaborated to various testable hypotheses for our experiments.

HYPOTHESIS 2: *Participants in the experiments in the blind and open conditions adapt their behavior between periods in accordance with the learning processes described.*

The second type of learning distinguished by Selten (imitation of successful others) is not possible in the present study, because the subjects did not receive information about the choices and earnings of other individuals. We shall, therefore, elaborate and test the hypothesis for the other two kinds of learning.

Rote learning

This is the most simple kind of learning. No insight in the situation is required, no expectations or beliefs about how other subjects will change their behavior from one period to the next are involved; the only capability required is the recognition of successes and failures, and a memory to record previous outcomes.

Start with the assumption of a one-period memory: periods before the last period are not considered by a subject when deciding what to do now. A decision is defined to be *right* (*wrong*) if the alternative decision would have yielded less (more) profit, given the choices of the other participants. In this case rote learning indicates that if a decision was wrong in the previous period, the alternative decision will be chosen in the present period, whereas a right decision will be repeated from the previous period. In fact, this may be called myopic adaptive behavior; at $t+1$ play the best response to the situation at t.[21]

To examine whether rote learning in the form of myopic adaptive behavior occurs in the experiments, decisions must be compared with the decisions and outcome in the previous period. This yields the following elaboration of hypothesis 2.

HYPOTHESIS 2a: *A right (wrong) decision is followed by a the same (alternative) decision in the next period.*

One way to test this hypothesis is to check whether switches occur more often after wrong decisions than after right decisions.[22] Table 7 presents the percentage of participants that made a different decision after right or wrong previous choices. A distinction is made in the winall and propres configurations and between buyers and non-buyers in the previous period.

Though evidence of myopic adaptive behavior is found in the table, especially for *winall*, it is not very strong.[23] In addition, it should be noted that peculiarities were observed when analyzing the data. For example, in the *winall* condition, after a draw, non-buyers switched to buying (significantly) more often when their group lost the random draw than when their group won it. Moreover, in various cases reactions to wrong decisions proved asymmetric: the reaction to a wrong decision in a losing group is different from the reaction in a winning group. Nevertheless, it would appear that some rote learning is taking place.

---

[21] This section on learning behavior is partly based on suggestions by Eric van Damme of Tilburg University, in private communication. He suggested a model based on myopic adaptive behavior, inertia and forward lookingness. This is discussed below.

[22] It should be noted that not one participant showed this type of myopic adaptive behavior in every instance.

[23] It should be noted that seperate analyses for various conditions do not alter this conclusion.

Table 7: Switches in Decisions[a]

		Winall	Propres
Buyers	right decision	41%*	50%*
	wrong decision	47%*	63%*
Non-Buyers	right decision	25%*	23%
	wrong decision	32%*	23%

[a]The numbers in the cells represent the percentage of participants that switched to the other decision for various outcomes in the previous periods. For example, in the winall condition, 41% of the buyers of discs in the previous period switch to non-buying, even though non-buying would have yielded less payoffs previously.
*Indicates that the difference in reaction to a right and wrong decision is statistically significant at a 5%-level (Chi-square test).

One can attempt to make the model more realistic by dropping the assumption that subjects' reactions are based on the outcome of the previous period only, and by taking into account the extent to which the previous decision was wrong or right. If in the previous period the alternative decision would have yielded a pay-off that is substantially (marginally) higher, the tendency to switch to the alternative decision will be stronger (weaker). The hypothesis then reads that subjects will switch if they are not satisfied with their earnings in the previous periods. Satisfaction with the outcome was not measured, however, so the additional assumption is needed that on average subjects who earned more are more satisfied.

HYPOTHESIS 2b: *The tendency to switch behavior is lower, the higher the average earnings in previous periods is.*

This was tested by comparing average earnings (in the last period and in the previous three periods) of switchers and non-switchers for all conditions except *mixed*. In *propres* subjects who switched earned less money in the previous period as well as in the the previous 3 periods than subjects who repeated their decision (t-tests, in both cases $p<.001$). However, this effect is caused by the subjects who did not buy a disc in the previous period, for the buyers there is no effect (previous period) or an effect in the other direction (previous 3 periods, t-test $p<.01$). This latter result - that participants who bought a disc in the previous period and did not buy one in the present period had earned more money on average than those that bought one in both periods - is caused by the subjects who almost always bought (and therefore almost never switched) and earned relatively little money.

In the *winall* conditions the hypothesis is supported (t-tests $p<.001$), this holds for both the buyers (previous period $p<.01$, previous 3 periods no effect) and the non-buyers (t-tests respectively $p<.05$ and $p<.001$).

Belief learning

In this kind of learning, beliefs are strengthened or weakened by outcomes. We focus on beliefs (expectations) concerning the behavior of the other subjects (cf. the analysis of dynamic games for a discussion about bayesian learning of the altruistic orientation of others). A subject will buy a disc if and only if (s)he expect that buying is profitable on average, given her or his expectations about the choices of others. If the outcome is in line with these expectations and the result is positive (compared to the alternative decision) one is likely to make the same decision in the following period. A negative result does not necessarily imply that the decision was principally wrong (because of the uncertainty about the behavior of other participants), and will not always lead to a different decision in the next period. It will only do so if the outcome was far from the expected outcome and the expectations are adapted. This type of learning leads to *inertia*: subjects will often make the same decision.

HYPOTHESIS 2c: *Participants will have a tendency to repeat behavior over periods.*

There is some evidence for inertia in our data. In 67% of the *winall* cases subjects made the same decision as in the previous period; we would expect 52% if the decision was totally independent from the previous decision (given the fact that, on average, 39% of the subjects buy a disc, independence means that .61*.61+.39*.39=52% makes the same decision twice in a row). The difference is statistically significant at $p<.0001$ (Chi-square test). In the *propres* condition these percentages are 67% and 61%, respectively (statistically significant, Chi-square, $p<.0001$).

In the course of the session subjects will probably also form expectations about how the outcome of the last period will influence the choices of the other participants, a kind of *forward lookingness*. The existence and influence of these expectations is difficult to examine in the present study. Some subjects indicated in the questionnaire that their decisions were sometimes based on predictions about the decisions of the other participants. For example, a subject wrote: "I speculated that if they had some successful rounds, free-riding behavior should increase and our cooperative behavior should be profitable". This kind or reasoning can explain why *winall* subjects in the strong losing groups (where the winning group bought at least 2 discs more) buy more discs in the next period. However, these explanations are ad hoc, therefore we plan to measure expectations in future research.

Towards a Behavioral Model?

So far, we have discussed only very simple learning models, with some positive results. It should be noted, however, that buying a disc was almost always unprofitable in this experiment. In *propres* 85% of the decisions to buy a disc (n=393) were wrong (in the sense that not buying would yield more money), and 20% of the decisions not to buy a disc (n=1047) were wrong. On average buyers would have earned 36 cents more by not-buying, and non-buyers would have earned 33 cents less if they had bought a disc. In *winall* 63% of the decisions to buy a disc (n=1110) were wrong (not buying would have yielded 1 guilder more) and 39% of the decisions to not buy a disc (n=1750) were wrong (buying would have yield on average 25 cents more). Nevertheless subjects kept buying discs. Any successful learning model should be able to explain this phenomenon. Given the results for hypotheses 2, such a model will probably contain elements of myopic adaptive behavior and inertia.

In the private communication mentioned in footnote 21, Eric van Damme suggested a behavioral model for the experiments at hand. Worth noting is that his model need not converge to a Nash equilibrium. The model combines the aspects of myopic adaptive behavior, inertia and forward lookingness described above. The weight each type of behavior is attributed depends on the outcome in a previous round. After a large victory, myopic adaptiveness is strong: the number of discs by the losing team drops to zero, non-buying winners do not buy again, and buying winners randomize. Especially the first of these three assertions is rejected by our data.

In the second situation, a tie in the previous period, some forwards lookingness enters: though buyers are assumed to repeat their decision, non-buyers take account of the fact that other group members may show myopic adaptiveness and buy a disc, so some of the non-buyers will not buy a disc, as a consequence of their forward-lookingness. The first part of this hypothesis is not supported by our data: buyers are not more stable after a tie than otherwise.

The third situation concerns a victory by one disc. Here, forward lookingness is assumed to become so strong that buyers in the winning team will tend to switch to non-buying, whereas the reverse holds for non-buyers in the losing team. Once again, not much evidence of this happening is present in our data.

It may seem strange to discuss a model offered in private communication only to argue that it is not supported by the data. The reason to do so is, first of all, that it combines various aspects of learning behavior in an appealing way. A priori, it seems to make sense. Moreover the fact that the behavior need not converge to a Nash equilibrium makes the model worth looking at, given our rejection of various Nash-equilibria. Nevertheless, something seems to be missing in all the models of individual behavior discussed. It is to this, that we now turn.

4.4. Back to the Drawing Board: What is Missing?

In this section, we have presented various theories about individual behavior. Especially the game theoretic models found only limited support. Though some weaker hypotheses (usually concerning comparative static implications of the theories) were supported, as mentioned above, the general picture is that something is still missing. Though the various elements of the learning model appear to find some support, there too, something is still missing. Therefore, we must ask ourselves (1) are the experiments doing what we intend them to do; and (2) if so, what is wrong with the models discussed?.

To start with the experimental design, a first potential concern is the ecological validity. Perhaps the models of individual behavior describe the voter turnout problem adequately, but our experiment does not describe the same decisionmaking process. In section 6, we shall argue that we believe that our experiments do describe the process. Moreover, individual models of voter turnout have typically been very unsuccessful (cf. section 2). This is precisely the raison-d'être of the present study. Even if this were not the case, however, many of the models described above claim to describe behavior in the experiment itself. Therefore, the models must be scrutinized.

When discussing and elaborating the models, we have maintained one assumption throughout. Unless there was explicit reason not to do so, symmetric behavior has been assumed in all cases where incentives and restrictions were symmetric. In the Nash-equilibria, differences between groups were allowed, but symmetry within groups was maintained. In the learning models, the same processes were assumed for all individuals. The fact that hypotheses concerning point predictions behaved poorly, whereas comparative statics were supported, is an indication that some individuals may actually behave according to theoretical predictions, while others do not. It may then be expected, that relaxing the assumption of symmetry will yield an improvement in results. For example, one could allow asymmetric Nash equilibria, where some participants always vote, some never vote, and the rest play various mixed strategies (cf. Palfrey and Rosenthal, 1983). In the learning model, one could allow different individuals to learn in different ways (note that the van Damme model allows different learning in different situation, but does not distinguish between individuals).

The reason why we have not incorporated individual variablity in the models is that we have not had objective grounds for distinction. It is one thing to claim that different individuals will behave in different ways, it is something completely different to allow each individual to potentially fulfill any role. This yields so many degrees of freedom that the data can be made to support any theory. What is needed is an a priori classification of individuals in various roles distinguished by theory. For example, if game theory provides equilibria with n different participation rates in equilibrium, then the individuals must be categorized in the n groups before the theory is tested. Doing so requires independent tests for the classification, i.e., it may not be done using participation decisions.

Unfortunately, in this experiment no such information was obtained, except in the questionnaire. The questionnaire has the disadvantage, that responses may be affected by behavior during the experiment. Moreover, no incentives were provided for truthful response. Currently, experiments are being designed, where independent classification tests are included. These will allow fair testing of individual behavior models in which asymmetry in identical situations is allowed.

A first indication of the effect of differences between individuals is found by looking at variation in behavior of individuals that vary in their goals and orientation, as measured in the questionnaire. This is discussed in the next section. As for learning behavior, the questionnaire included an open question concerning the way in which they arrived at their decisions. In answering this question, 47% of the subjects spontaneously refer to the previous period. In a different question (using a seven-point scale) we explicitly asked to what extent the result of the previous period influenced their decision. Comparing two groups of subjects: one with a high influence (≥ 4 on the scale), and one with a low influence (score < 4), no rote learning is found for the latter group, whereas significant rote learning (in the sense that myopic adaptive behavior is observed) is found for the former. Even for the group that reports a high influence, a large number of participants stick to a wrong decision or switch from a right decision, however.

5. Other Hypotheses Concerning Individual Behavior

In section 2, the discussion of the literature on voter turnout and free riding behavior yielded a number of hypotheses that can be tested using our data. This section is dedicated to doing so. It starts with a hypothesis concerning the expected closeness or expected benefit of an election.

HYPOTHESIS 3: *In the winner-takes-all case, participation will increase as expected closeness increases. In case of proportional representation, participation will increase as the expected benefit increases.*

To test this hypothesis, an assumption as to what individuals expect that others will do in a specific period is needed. In the experiments, expectations as such were not measured, so an assumption is needed concerning their formation. In *mixed*, participants are not thought to have expectations concerning the purchase of discs in any period t in both groups, because they have no idea what the group composition in t will be. We shall make the simple assumption that an individual in *blind* or *open* expects all others to make the same decision in t as they did in t-1.[24] In *winall*, as the choices of others in the previous period are closer to a tie, an individual is more inclined to buy a disc. In *propres*, the marginal benefit to be obtained from buying a disc (MB_{it}) can be calculated as:

$$MB_{it} = 2.22 \cdot \frac{n_{it}^{I}+1}{n_{it}^{I}+1+n_{it}^{II}} - 0.7 - 2.22 \cdot \frac{n_{it}^{I}}{n_{it}^{I}+n_{it}^{II}}.$$

These assumptions yield the following elaboration of hypothesis 3 (cf. section 4.1 for the notation used).

HYPOTHESIS 3a: *In winall, for blind, blind-8x6, blind-14x14 and open, p_{it} is negatively correlated to $|n_{it-1}^{I} - n_{it-1}^{II}|$; In propres, for blind and open, p_{it} is positively correlated to MB_{it-1}.*

A weaker version of this hypothes reads:

HYPOTHESIS 3b: *In winall, for blind, blind-8x6, blind-14x14, and open, p_{it} is higher for $|n_{it-1}^{I} - n_{it-1}^{II}| = 0$ or 1 than otherwise; In propres, for blind and open, p_{it} is higher for $MB_{it-1} > 0$ than for $MB_{it-1} < 0$.*

Results

For 3a, the decision to buy a disc or not was related to MB_{it-1} for *propres* and to $DIF_{it-1} = |n_{it-1}^{I} - n_{it-1}^{II}|$ for *winall*, in two ways. MB denotes the marginal benefit i could have achieved by buying a disc in the previous period, and DIF denotes the closeness of the result of the previous period (both net of i's decision). First a t-test was used to test for a differences in the average value of MB_{it-1} and DIF_{it-1} between subjects choosing to buy a disc ($x_{it}=1$) and those choosing not to ($x_{it}=0$). In *propres*, the average value of MB_{it-1} is -0.39, -0.38, for $x_{it} = 0,1$, respectively. The difference, indicating that buyers expect a slightly higher marginal benefit of voting than non-buyers (basing expectations on the result of the previous period) is not statistically significant.[25] In *winall*, over all conditions (except *mixed*) the average value of DIF_{it-1} is 1.73, 1.47, for $x_{it} = 0,1$, respectively. The difference, indicating that buyers expect a closer race than non-buyers is statistically significant. This resuults is also found for each configuration seperately, though the difference is not statistically significant for *open*.

---

[24] An alternative assumption would be that individuals expect everyone else to choose an equilibrium strategy. In that case, expected closeness is constant as is expected benefit (cf. table 4) and no effect can be measured.

[25] Unless indicated otherwise, statistical significance is measured at a 5%-level, using a two-tailed test.

The second way in which 3a was tested, was by running a logit regression with dependent variable x_{it}, using a constant term and MB_{it-1} or DIF_{it-1} as independent variables. For *propres*, the coefficient found for MB_{it-1} is 0.20, with a t-value of 0.71. The positive sign of the coefficient is again in line with the hypothesis, but the value is not statistically different from zero. The coefficient found for DIF_{it-1} in *winall* is -0.16, with a t-value of XXXX. The negative (statistically significant) sign is in line with the hypothesis: expected closeness (a low value for DIF_{it-1}) has a positive influence on the probability of buying a disc.

As for hypothesis 3b, in *propres*, individuals facing a positive (negative) value of MB_{it-1} buy a disc 29.8% (28.6%) of the time. In *winall* individuals facing DIF_{it-1} equal to 0 or 1 buy a disc 44.3% of the time, as opposed to 33.4% of other individuals. Both diferences are as expected, only the latter difference is statistically significant.

All in all, the results support the hypothesized positive relationship between expected closeness and participation in *winall*, but a positive relationship between expected benefit and participation in *propres* is less clear.

The next hypothesis concern the affect of group identification on voter turnout.

HYPOTHESIS 4: *As within group identification increases, participation will move from an individual-level towards a group-level optimum.*

The first thing to be done, is to determine what an 'optimum' is. We simply assume that this is represented by the game theoretical (pure strategy) equilibria derived in section 4.1. In that case, the hypothesis can be tested most thouroughly for *propres*, because both levels have the same equilibrium in *winall*. On the other hand, in the latter configuration, there are mixed strategy equilibria of lower buying levels than the group-level equilibrium. Therefore, we conjecture that some increase in buying may occur as we move from the individual- towards the group-level in *winall* as well. Finally, it is necessary to establish the pattern of group identification. This is assumed to increase as we move from *mixed* to *blind* to *open*.

HYPOTHESIS 4a: *In propres and winall,* X_i*(in open)* $>$ X_i*(in blind-6x6)* $>$ X_i*(in mixed).*

Results

The increase in participation as the group condition moves from *mixed* to *blind* to *open* for the *propres* configuration is tested using a F-test for the group means. The average number of discs bought is 4.88, 5.79, 5.70, respectively. The slight difference between *blind* and *open* has the wrong sign. The difference in means is statistically insignificant, as are all pairwise comparisons. The difference between the mean number of discs in *mixed* on the one hand and in both other conditions pooled on the other is not significant either. For *winall*, the means in (*mixed, blind-6x6, open)* are (5.73, 9.29, 7.55). The difference between the first two numbers is statistically significant, the difference between the latter two numbers is not, and has the wrong sign.

All in all, the hypothesized move from an individual- towards a group-level equilibrium as group identification rises is supported for the step from *mixed* to *blind*, but not supported at all for the move from *blind* to *open*. Of course, this result may be related to the way in which group identification is manipulated in the experiments. We shall return to the success or failure of this manipulation in the concluding discussion.

We now turn to free-riding. The voluntary provision literature (cf. section 2) seems to conclude that free-riding will occur, though it is usually not observed to be complete.

HYPOTHESIS 5: *Free-riding within groups will occur, and will be stronger as the incentive to free-ride is greater. Free-riding will not be complete, however.*

This is tested by comparing the decisions in *winall* to those in *propres* and those in the larger group conditions for *blind* to those in the 6x6 condition.

HYPOTHESIS 5a: *X_i is larger in winall than in propres, and X_i in blind-14x14 > X_i in blind.*

Note that hypothesis 1b already makes a comparison between *winall* and *propres* for the group condition *mixed* and 1d for *blind*. In addition, 1d also compares *blind-14x14* to *blind*. Support for the hypothesis was found in all cases. The remaining case, a comparison for *open* shows an average of 7.55 discs for *winall* and 5.71 for *propres*. The overall difference between both configurations is statistically significant. The hypothesis that free-riding increases as the incentive to do so increases, is supported. Note that free-riding is not complete.

We now turn to the role of communication. The results by Isaac et al. (1985), Linder (1982), Dawes et al. (1977), and Bornstein (1992) all seem to imply that communication will decrease free-riding behavior, hence:

HYPOTHESIS 6: *Communication will decrease free-riding, and hence increase participation.*

This can be tested using the five additional periods of play introduced after period 20 in group conditions *open* and *blind-8x6*. These periods were held after 5 minutes of free communication within groups were allowed. Naturally, the mean number of discs bought should be compared to the last five periods before communication. Moreover, one should take account of the difference between the larger and smaller group in the 8x6 case. The former may have free-riding incentives to overcome, for the latter it is not clear what will happen.

HYPOTHESIS 6a: *In open and for the larger group in blind-8x6, X_i is larger in the five periods after communication than in the five periods before.*

The mean number of discs bought in the five periods after (before) communication in *open* is 2.82 (1.32). The difference is statistically significant. A statistically significant effect is found for the role of communication when the data are split in *propres* and *winall* as well. For the group of 8 in *blind-8x6* an increase form 1.38 to 4.56 discs on average (statistically significant) was observed. The members of the 6-person group seem to have realized that the larger group was likely to buy more discs, so they would have little chance of winning. This smaller group bought less discs after communication than before (1.17 versus 2.17). All in all, these results support the hypothesis.

The final hypothesis 7 concerns free-riding behavior by economists versus non-economists (cf. Marwell and Ames, 1981). Because we know the field our subjects major[26] in, we can test this using individual decisions.

HYPOTHESIS 7: *Economists free-ride more than non-economists.*

This is elaborated as:

HYPOTHESIS 7a: *X_i is smaller for students of economics or econometrics than for other subjects.*

On average, students of economics or econometrics bought 6.34 discs, and students with a different major bought 7.93 discs. The difference is statistically significant. Because the number of econom(etr)ic majors was relatively higher in early sessions than in later ones, we corrected for a parameter configuration and/or group condition effect, but a significant effect of the major chosen remained. All in all, this result supports the hypothesis.

Individual Characteristics and Orientation

Though no hypothesis has been put forward with respect to the influence of individual characteristics

---

[26] Actually, in Dutch universities students choose a field directly when entering the undergraduate level. We use the term 'major' to enhance readibility.

(other than the field one majors in) on decisions, this constitutes a general problem one can investigate with the experiments undertaken. Moreover, using the results of the questionnaire, some information on individual motivation and orientation can be gathered and compared to the individual choices made.

Individual characteristics may influence the way subjects make their decisions. In this study, information was gathered on age, gender, field (major), employment status, administrative experience, and participation in a previous experiment. Except for the major chosen, which has been dealt with in hypothesis 7, no significant effect of these characteristics is expected and none was found. An interesting question with respect to the effect found for major, concerns in what way the field of study influences a subject's decisions: does it affect the orientation or goals of the subject? This can be investigated using the responses to the questionnaire.

The orientation of a subject in the experimental situation is likely to influence her or his decisions. By orientation we mean the way in which the subject perceives the situation. For example, some subjects focus primarily on the social and strategic side of a situation and stress the interdependence of the players, while others tend to see the situation simply as decision making under uncertainty, as a game against nature.

A study into the orientation of participants seems worth undertaking, if only to help one find hypotheses to test in future experiments. These hypotheses could concern, for example a basis for distinguishing between individuals when adding asymmetry to models of individual behavior. It is difficult to find out the orientation of subjects in an experiment, however. A questionnaire may be used as a supplement to the experimental data. Asking direct (multiple choice) questions on individual orientation has the disadvantage that the phrasing of the question can affect the ideas the subject has. For example, asking many questions about the strategic qualities of a situation may give the subject the impression that (s)he should have adopted a strategic attitude and will have an influence on the answers. Asking open questions has the disadvantage that the information gathered may not be complete (e.g., if a subject has 3 reasons for making a specific decision, (s)he might only mention one or two of them in the questionnaire), and that the processing of the data is much more labourous. In the questionnaire used in this study, both open and multiple choice questions are included.

In their responses to questions asked, 50% of the subjects referred to the interdependence between subjects in the experiment. 56% of the subjects referred to their own group, 32% referred to the other group, 6% referred to all subjects (as one group) and 36% made no reference to other subjects at all.[27] These variables do not vary between conditions in the experiment. Students of econom(etr)ics refer to the interdependence less than other subjects (49% vs 54%, the difference is not significant). The same holds for economists' reference to their own group (49% vs 68%, statistically significant). It turns out that subjects who refer to the interdependence bought more discs (7.9 vs 5.7, statistically significant) than subjects who did not. Along the same line, subjects referring to their own group purchased more discs (8.1 vs 5.3, statistically significant) than subjects who did not.

As for the goals subjects have, these may differ among individuals. As discussed in section 4.4, a distinction of various goals may be of aid in defining differences between individuals. In current experiments, tests for goals are included at the beginning of the experiment. In the experiments described in this paper, information had to be obtained from the questionnaire. This included questions concerning four particular goals: (1) the goal to make as much money as possible in the experiment (*individualism*); (2) the goal to make more money than other subjects (*competition*); (3) the goal to make as much money as possible, together with the other members of the group (*cooperation*); and (4) the goal to make as much money as possible together with the all other subjects (*collective*). Of course, individualsm is the assumption most common to economists. As discussed in section 2, however, this can lead to a paradox when applied to the voter turnout decision.

If a subject pursues only one of the goals, one can hypothesize what her or his decision will be. We expect that subjects with a collective goal will buy few (or no) discs, and subjects with a cooperative goal will buy a lot of discs. As a consequence of the intragroup conflict, subjects with a indivi-

[27] These percentages do not add up to 100% because some subjects referred to both groups.

dualist goal are expected to use equilibrium strategies if other players do. They may have a tendency to buy only a few disks, but will buy more in specific situations described in various hypotheses above. Subjects with a competitive goal face a dilemma: in order to earn more than the other members of their group they should buy no disks, but in that case they run the risk that subjects in the other group may earn more than they do. Of course, subjects can (and most of them claim they do) pursue more than one of these goals. Especially subjects with an altruistic tendency who have both cooperative and collective goals face a dilemma.

The main goal of the subjects proved to be to earn as much money as possible (mean score of 5.9 on a seven-point scale), but competitive, cooperative and collective goals are also found (mean scores respectively 3.4, 3.9 and 3.3).[28] The goals are closely related to the orientation of the subject as decribed above: subjects referring to interdependence report cooperative goals more often than others (the difference in mean score is statistically significant).[29] Subjects referring to their own group have significantly more cooperative goals and less individualistic goals than others. Finally, subjects referring to all subjects report significantly more collective goals than others.

Students of econom(etr)ics appear to have more individualistic and less cooperative goals than other subjects. Interestingly, there also appears to be a difference between the experimental group conditions concerning the competitive goals: subjects in *open* report significantly more competitive goals than subjects in *blind* or *mixed*. This would seem to indicate that the openness of group composition had the unintended effect that more competitive goals arose (compared to *blind*, where composition was fixed but anonymous). Future experimental research is needed to get a better grasp of the meaning and consequences of this result.

Statistically significant correlations are found between the number of discs bought and the intensity of goals in case of individualistic goals (-.240) and in case of cooperative goals (.257). No significant correlation with competition or collective goals is found. This indicates that subjects reporting individualistic (cooperative) goals are less (more) likely to but discs. If this result is replicated in more thorough derivation of individual goals, it provides reason to distinguish between various individuals in game-theoretic analyses or learning models.

It is stressed that our study of individual characteristics and orientation is not meant as a formal theoretical or empirical analysis. It is only meant as an explorative investigation of what is happening in the experiments undertaken. The results of this investigation can supplement the results of the experiments but are not expected to go further than that. It has been stressed, however, that they form a point of departure for future (and current) research.

Moreover, orientation and goals should not be considered as individual characteristics. Of course, they may be related to some personality traits like altruism, but the mood of a subject on the day of an experiment may play a role as well. They are also dependent on elements of the experimental situation, however, like the behavior of other subjects, the group condition and configuation in a session, or the experimental set-up in general.

6. Concluding Discussion

The first question to be addressed in conclusion is whether the experiments used describe the individual turnout decision adequately. The results are promising. Both the interpretation of subjects' decisions (e.g, the influence of expected closeness investigated in hypothesis 3, the group identification hypothesis 4, and the free-riding hypothesis 5) and their conception of the decisionmaking problem as stated in the questionnaire support a positive answer to this first question. The fact that only limited support was found for the hypotheses concerning game theoretical models is more relevant for an evaluation of these models than for an evaluation of the experiments. It should be stressed again that these models have generally not been very successful in explaining voter turnout in elections, either.

---

[28] Details concerning the way in which the questionnaire was used to derive these results may be obtained fron the authors.

[29] Naturally, one should take care in comparing reported goals and reported orientation in this way, especially when obtained in the same questionnaire, held after the experiment has been completed and subjects are aware of the results.

The type of experiment developped will therefore be used in future investigations with respect to determinants of voter turnout and other participation game situations.

A second matter, is whether the manipulation of group identification by the conditions *blind-open* was successful. Both the problem mentioned in section 3, that some participants knew their neighbor's group allocation in *blind*, and the unexpected difference between *blind* and *open* in the number of discs bought raise some doubt. Three questions that can be used to test the success of this manipulation were included in the questionnaire. These concern within group identification. In *blind*, subjects showed no preference for membership of their own group or for the other group. In *open*, a slight preference for the own group was reported, but the difference with *blind* is not statistically significant. The subjects were also asked their opinion about the wiseness of the choices made by the members of the own and the other group. In *blind*, subjects found the choices made by the other group to be slightly more wise, and subjects in *open* found the choices made by their own group slightly more wise, but the difference is again not statistically significant. Thus, we find no strong support that the manipulation of within-group identification by moving from *blind* to *open* was successful. The results for these two conditons do not indicate a successful manipulation either.

Turning now to some general implications following from the results in sections 4 and 5, one conclusion is that game theoretical solutions do not provide accurate point predictions for behavior in the present setting (hypotheses 1a and 1c). Comparative statics implied by game theory do better (1b, 1d). The same holds for some standard learning models (hypotheses 2a-2c). It was found that significant differences between participants exist with respect to their orientation, and their goals. Moreover, given the caveat made, it appears that these differences have an impact on behavior. Besides this, it was established that economists act different than other people do (hypothesis 7). These differences may explain the reason why comparative statics do better than point predictions.

An interesting result with respect to the role of individual- versus group-level equilibria is the support for hypothesis 6, which states that participation will increase with communication. This may indicate that group-leaders play a role in focusing individuals' attention on group goals. In future experiments, the role of communication will be investigated more thoroughly, by allowing costly communication through the computer network. This may give information with respect to the type of communication that is of importance and the differences between subjects with respect to the number and type of messages they send. The question is whether differences between individuals are such, that group leaders will endogeneously arise that try to enhance group participation.

Combining these results, the results of the experiments imply that a model of individual behavior in a participation game must address various points. (1) It must explain how individuals can be classified (e.g., according to orientation, goals, or ability), in order to provide a basis for an asymmetric treatment; (2) it must predict the behavior of individuals in the various classes distinguished, either using game theoretic tools or learning models; (3) it must explain in what way a conflict between individual- and group-level goals is handled by individuals with common group interests; (4) it must somehow deal with the effect of communication and group leaders. A first attempt to model voter turnout along these lines, was presented in Schram and van Winden (1991). Future research will need to contain more experiments aimed at clarifying these points.

Appendix: The Results

For each session, for each of the 20 (25) periods, per individual the group allocation (1= yellow, 2=blue) and choice (0: denotes the decision to buy a disc, 1 denotes the decision not to buy a disc) is presented. This is followed by the total number of discs bought by yellow and blue, the result of the random selection of a winner in case of a tie in *winall*, and the gross payoffs to yellow and blue.

GAY POLITICS IN THE LEGISLATIVE ARENA: THE POLITICS OF CONCEALMENT

by

Abstract

AIDS has propelled gays into the heart of the political process. The onset of AIDS has simultaneously made gays more visible and given them a reason to seek aid from the political process. In this paper we examine three gay related votes on the 1988 AIDS bill. We look at four explanations of the votes, majority voting, minority voting, ideological voting and concealed voting. We argue that the last best represents the political process on gay related votes.

Gay Politics in the Legislative Arena

Introduction

Although it is possible that AIDS (acquired immune deficiency syndrome) has existed since the 1950s, the first generally recognized cases in the United States occurred in 1979. Despite rumors of a "gay cancer" spreading through large urban centers in the Northeast and West coast, the Centers for Disease Control did not issue a report about the epidemic until June 1981.[1] Over the next two months a total of 108 cases were identified and 94% of these were among homosexual or bisexual men (Bayer 1983: 5). The fact that AIDS first appeared within the gay community in the United States and was initially called GRID (Gay Related Immune Deficiency Syndrome) has enormous policy implications.[2] This early association of homosexuality with the syndrome has meant that social attitudes towards homosexuality[3] and the political strength of the gay community have shaped the policy response towards AIDS.

One indicator of the strength of the public's perception of the linkage between AIDS and homosexuals can be drawn from survey research on public opinion about AIDS policies. For example, Stipp and Kerr (1989: 102) discovered that the best predictor of public attitudes towards HIV (human immunodeficiency virus) infected people is one's view towards homosexuality. Another study found that individuals with negative attitudes towards gay people generally favored punitive and restrictive policies against people with HIV, such as tattooing and issuing them identity cards (Price and Hsu 1992: 47).

Not only has the AIDS epidemic forced heterosexuals to confront their feelings about homosexuality, it has fundamentally altered the pattern of interaction between the gay community and the government. Prior to the advent of AIDS, organized gay political behavior primarily

---

[1]The June 5, 1989 volume of Morbidity and Mortality Weekly Reports included a discussion of the "unusual" appearance of pneumocystis cariini pneumonia in five Los Angeles gay men. The article went on to suggest a possible linkage between the "homosexual lifestyle" and the illness.

[2]Representatives of gay organizations were extremely concerned that the labeling of the epidemic GRID would heighten the discrimination against gay people in the country. Their lobbying of the Centers for Disease Control helped convince officials to rename the syndrome (Stoddard and Rieman 1991: 256).

[3]Some observers, like conservative commentator Patrick Buchanan, have argued that people with AIDS were being punished for their "deviant" sexual practices. "Those poor homosexuals. They have declared war on nature and nature is exacting an awful retribution" (Buchanan May 24 and 25, 1983). This tendency to attribute AIDS to a "deviant" lifestyle was not limited to conservative political and religious figures. Dr. James Fletcher in an editorial in the Southern Medical Journal made a similar point when he wrote, "Might we be witnessing, in fact, in the form of a modern communicable disorder, a fulfillment of St. Paul's pronouncement: 'the due penalty of their error'" (Fletcher February 1984).

was directed towards keeping the government out individuals' private lives.[4] However, because AIDS disproportionately affected homosexual men,[5] gay political organizations for the first time were in a position of lobbying the government for financial resources. This was a radical transformation. Gay lobbyists began to mimic the behavior of their counterparts representing more traditional political constituencies (i.e., akin to the requests of lobbyists representing peanut growers for more agricultural subsidies.) The AIDS epidemic also made it impossible for governmental actors to ignore the gay and lesbian community. Officials at the local, state, and federal levels of government were forced to confront demands that AIDS funding be made a national priority, and this in turn, forced many of these individuals to confront their own feelings about homosexuality. For these reasons the policy response to the AIDS epidemic provides a particularly suitable case for assessing governmental attitudes towards gays and lesbians.

Although there have been a number of excellent studies of AIDS policy-making at the state and local level (Colby and Baker 1988; Gostin 1989; Ron and Rogers 1989; Martin and Dean 1990; Le Poire, Sigelman, Sigelman, and Kenski 1990; Slack and Luna 1992), there have only a few studies of policy-making at the federal level (Fox, Day and Klein 1989; Gostin 1990) and none of these have focused on Congress, the body that actually enacts national legislation. Researchers' emphasis on the state and local response to the AIDS epidemic is understandable. Since people with AIDS stretched municipal and state medical resources sooner than national resources, those levels of government were faced with making policy choices at an earlier point in time. Others consider the slow federal response to the AIDS epidemic to be partially due to a national "leadership vacuum" (Johnson and Jones 1991). Because most HIV infected individuals are members of stigmatized groups (i.e., homosexuals, bisexuals, and/or intravenous drug users and their partners), national politicians have little electoral incentive to push for

---

[4]The only pre-World War Two gay political organization, the Chicago Society for Human Rights, organized around civil liberties for gays (Adam 1987: 39). Although the Chicago Society for Human Rights only lasted a very short period of time, its focus on obtaining the normal rights of citizenship for gays was passed on to its postwar descendants. The homophile organizations of the 1950s, such as the Mattachine Society and the Daughters of Bilitis, sought to end witch hunts directed at ferreting out gays and lesbians employed by the federal government and attacks on gay and lesbian gathering places (D'Emilio 1983 and Adam 1987). John D'Emilio's (1983) Sexual Politics, Sexual Communities: The Making of a Homosexual Minority in the United States, 1940-1970 and Barry D. Adam's (1987) The Rise of a Gay and Lesbian Movement are excellent histories of the origins of gay political behavior in the United States. This emphasis on defending the "right to privacy" continued up in the 1980s. The National Gay Task Force (N.G.T.F.), the most important national gay political organization, was still making the "right to privacy" its central political demand up until the advent of the AIDS crisis (Altman 1982: 135).

[5]Although it is impossible to accurately assess the prevalence of the disease within any community, in the cities that comprise the epidemic's epicenters approximately half of all gay men between the ages of thirty and forty-five are sero-positive (Gagnon 1989: 55).

additional funds for treatment and research.[6] In some cases elected officials may actually reap political benefits by attacking people with AIDS. The President of the United States did not publicly address the AIDS epidemic until the spring of 1987, after almost 21,000 people had died of the disease (Peck and Bezold 1992: 135). Even though gay men made up the vast majority of those who had died, the President never mentioned homosexuality in his speech (Reagan 1987: 14D-16D). The national government did not pass comprehensive legislative providing funds for AIDS treatment and education until the end of 1988---nine years after the first cases were identified and after 1.5 million people had become infected with the virus (Congressional Quarterly Almanac 1988: 302).

The politics associated with the passage of the 1988 AIDS legislation provides an excellent means of assessing the responsiveness of Congress to the needs of the gay community. There were nine separate recorded Senate votes on S1220, the "AIDS Information and Treatment" bill. Three of these votes involved the role of the federal government in funding safe(r) sex education materials directed at homosexual and bisexual men.[7] The remainder dealt with issues, such as providing clean needles to intravenous drug users, requirements that applicants for marriage licenses be screened for HIV antibodies, and mandatory testing of prison inmates. Provisions from the "AIDS Treatment and Information" bill (S1220) were subsequently incorporated into an omnibus health measure (S2889---PL100-607), which was signed into law on November 4, 1988. This law, which provided approximately $600 million for treatment and education, was the first significant national policy response to the AIDS epidemic.

---

[6]Keniston made this point when he asked people to imagine what the policy would have been if AIDS "...were a disease that selectively affected white middle-class girls between the ages of two and fifteen" (Keniston 1989: 19).

[7]This is not the first time that Congress has enacted policies that affect the gays and lesbians. However, as was pointed out above, this is the first time that Congress was being asked to provide financial resources to the members of the gay community. In the past virtually all congressional actions towards the gay and lesbian community have been punitive in nature and part of attempts to root out subversives of one form or another. Following the Bolshevik Revolution in 1917, a Senate committee investigated the dangers posed by so-called "immoral conditions" within a Navy training station. See U.S. Senate, 1921, 67th Congress, 1st sess., Committee on Naval Affairs, "Alleged Immoral Conditions at Newport (R.I.) Naval Training Station." During the Red Scare of the early 1950s, "sexual perverts" were viewed as almost as much of a danger to national security as Communist infiltrators. In June 1950 the Senate authorized one of its committees to investigate "moral perverts" within the government. The subsequent report warned that, "One homosexual can pollute a Government office" and urged that "such morally contaminated persons" be fired (U.S. Senate, 1950, 81st Congress, 2nd sess., Committee on Expenditures in Executive Departments, "Employment of Homosexuals and Other Sex Perverts in Government"; 3-5). According to D'Emilio, thousands of civilian government employees were fired during this campaign against homosexuality. Additionally, 1,700 other people were denied government jobs between 1947 and the mid-1950s because of homosexuality (D'Emilio 1983: 44).

The Politics of Concealment

Like many other issues that come before Congress, the 1988 AIDS bill tapped more than one dimension. While at this time AIDS had primarily affected gays in the United States, it was clear to most informed observers that it had the potential to become a major disease amongst heterosexuals. Also, unlike most other sexually transmitted diseases, there was no cure. Thus one element of the reaction to the bill was the general desire to prevent the spread of an illness that could be harmful to all. Another thread of the pattern was the general desire to save life. People react differently to life threatening diseases than to other phenomena. It is possible to defend a vote to save a gay person from dying, even to a constituency that is strongly opposed to homosexual activity. Finally, even in 1988, a small number of people who were neither homosexuals or drug abusers had contracted AIDS. This too provided political cover for those favoring a comprehensive AIDS bill.

For all these reasons we did not think that the vote on the bill itself would provide a direct measure of congressional behavior towards gay issues. [8] But, as is often the case on major bills, there were a series of proposed amendments and motions intended to reshape the main bill. Among the nine subsidiary votes were three that were directly aimed at the gay community. In this paper we seek to identify the determinants of congressional positions on the three explicitly gay-oriented Senate votes on S1220.

How would we expect senators to vote on such issues? The congressional literature is rife with disputes on the determinants of voting. Some see voting as determined primarily by the opinions of constituents, while others place more weight on the views of the senators themselves. Some see political party affiliation as a major explanation, while others claim it is but a mask for the real determinants. Some feel that real political forces always prevail whilst others give weight to the institutional peculiarities of the Senate, such as the right to filibuster. In this paper we will look initially at three dominant explanations for Congressional voting and then advance an alternative that better fits the conditions under which voting on gay oriented policies takes place.

Three approaches dominate the work of political scientists. One approach, deriving from the work of Anthony Downs (1957; 1961) and David Mayhew (1974) sees voting as primarily driven by re-election needs. In this view the legislator seeks to cast votes that will appeal to a majority of his constituency and avoid votes that will anger that majority. The more important the issue is to that majority the more constrained he is to vote as his constituency wishes.

Another approach, deriving from the work of Schattschneider (1935) and Olson (1965, 1982), also sees re-election as a dominant motive but argues that small powerful minorities are more likely to gain their wish than large unorganized majorities (Schroedel 1986; Fowler and

---

[8]Another reason for not examining the bill itself derives from recent roll call analyses. Much of the recent work argues that votes on bills that have been previously shaped in committees contain systematic bias (VanDoren 1990; Snyder 1992). The motions and amendments we examine are less susceptible to this objection.

Shaiki 1987). Because of the free rider problem[9], small groups with large individual resources will find it easier to organize than larger groups where each individual has less at stake. Such groups can provide the candidate with money and other resources at election time, and will also be comprised of people for whom the vote on a particular bill is particularly salient and particularly likely to be noticed.

A third approach places more weight on the views of the representative. Because most constituents are poorly informed about their legislator's voting records, because many of those votes have little importance to them and because their representative is likely to cast votes for and against the interests of any given individual, it is hard for that individual to use their one vote, cast every six years to control their senator. This allows room for their senator to vote as his or her ideology dictates. Thus this view sees the personal ideology of the senator as the immediate cause of a given vote. In the last few years this has become the dominant view. A large body of work has claimed that most voting in Congress is along a fairly constant left-right continuum (Schneider 1979, Poole and Daniels 1985; Poole and Rosenthal 1985, 1991).

While these are often advanced as exclusive explanations, it makes more sense to think of all of them as relevant to some degree for all voting decisions, but with some being more important for some voting decisions and others for different ones. The feelings of the majority are more likely to be relevant on issues such as the budget and taxes, where large groups feel intensely about the issue. The view of strong organized minorities should be most important on issues such as farm subsidies where they have a lot to lose or gain and others have relatively little at stake. Ideological voting should be most important where the issue is of little importance to most of the legislator's constituency and where he or she feels strongly about the matter.[10]

How does voting on gay issues fit into this spectrum? Until recently the best description would have been one of an unorganized gay minority facing a somewhat more organized majority opposed to gays. We might expect legislators to be more sympathetic to gays than the average voter, but we would not expect this to be an issue that was very important to most legislators. Under these circumstances one would expect that there would be few bills proposed that were favorable to gays and that any such attempts would be stymied by the hostile majority. And such has indeed been the case.

But in more recent years the AIDS issue has mobilized gays. Areas with large concentrations of gays and lesbians have applied pressure to their legislators through groups such

---

[9]This is a classic problem in social organization. It occurs when someone can share the benefits of a good whether or not he pays for it. As everyone waits for everyone else to pay the good may never get supplied unless government forces people to pay the taxes to provide it. The classic example is the protection of the armed services. It is easier to make people pay voluntarily for such a good if there are only a few, than if there are a large number. See Mancur Olson (1965).

[10]Most of those who stand behind the view that congressional voting is performed on a fairly consistent left-right continuum would dispute the approach outlined in this paragraph and claim that all voting is primarily on ideological lines. However others strongly dispute this view and see the type of policy issue as crucial (Clausen 1973; Wilcox and Clausen 1991).

as the Human Rights Campaign Fund, the Gay and Lesbian Victory Fund and the National Gay and Lesbian Task Force. In response a number of small countervailing groups, such as the Family Research Council, Focus on the Family and Concerned Women of America, have made opposition to gay rights a central focus. A similar, but more subdued bifurcation has occurred amongst the general public. Some citizens, especially on the West Coast and in the North East have come to view gays as the latest claimants in the civil rights struggle that has embraced first blacks and then women and Hispanics. While not necessarily approving of gay sexual behavior, they have come increasingly to view it as something that is genetically determined rather than freely chosen. However other citizens, especially in the South East and Mountain States, have rallied around the old view that gay behavior is freely chosen, sinful and the Devil's work. These people equate gay rights with sin and decadence. The bulk of the public lies somewhere in between, but nearer to the latter than the former view (Klassen, Williams and Levitt 1989). Overall then we have an organized minority of gays and lesbians, opposed by smaller fundamentalist religious groups with the general public being generally anti-gay but not strongly so. Since senators, like other members of the elite, (Stouffer 1955; Dahl 1961; McCloskey and Brill 1983) should be more liberal on civil rights issues, we would expect that they would be more sympathetic to gays than their constituents would.

It is our contention that votes on gay related issues will not be fully explained by any one of the standard approaches. Rather we would expect to see what we term the politics of concealment. Viewed from the perspective of the legislator we have a strongly engaged and attentive minority supporting pro-gay policies favored by the legislator himself, opposed by a larger less attentive majority opposed to gays[11]. Under these circumstances optimal behavior should consist of voting against bills and amendments that seek explicitly to benefit gays, while voting for bills and amendments phrased in more general terms which happen to benefit gays but do not explicitly say so.

Under these circumstances optimal behavior by the proponents of policies favorable to the gay community would be to put forward universalistically phrased bills and amendments that do not mention gays and lesbians but do give them benefits. Analogously, opponents should propose bills and amendments that make a vote for gay oriented policies a vote in favor of a gay lifestyle. The legislative struggle would then be to define the issue in one of these two ways. Depending on the phrasing of the bill the same legislator could easily vote for or against gays. Thus it matters which amendment comes first, what limits there are and what obstacles can be placed in the way of voting. Success would depend on control of the agenda (McKelvey 1976) and the relative ability of the two sides in tactical maneuvering.

In the congressional literature two methods of testing hypotheses have primarily been employed. One group of scholars has relied on detailed case histories of legislation. Another group has relied on quantitative analysis of floor and/or committee votes. The case study method has the advantage of better revealing the motives of the participants and the context within which decisions are made. However it has the disadvantage that one can never be sure whether the

---

[11]It should be noted that the countervailing groups noted above are trying hard to raise the salience of the issue with the religious right and conservatives. If they succeed the balance between gays and their opponents could change again.

events described by the author are the crucial ones. Quantitative analysis has the advantage of better allowing comparison between different cases and of showing more precisely which causes have more weight. However it often misses important context and can mask important differences between events especially when some causes are hard to measure. Because both methods have advantages we use both methods to analyze the voting on three gay related votes. We will look first at the history of the voting in context and then move to a quantitative analysis of the crucial votes.

The History of the "AIDS Treatment and Information" Bill

On May 15, 1987 Senator Edward Kennedy (Democrat, Massachusetts) introduced the "AIDS Treatment and Information" bill (S1220) that would provide over $600 million in funds for AIDS education and treatment into the Senate.[12] The legislation was referred to the Labor and Human Resources Committee, which in June unanimously recommended that it be enacted into the law. Despite the unqualified endorsement of the authorizing committee and bipartisan support, the bill was not brought up to a vote on the floor of the Senate in 1987. After consulting with Senate leaders, the sponsors of the bill chose to keep it off the floor because they were afraid that Senator Jesse Helms (Republican, North Carolina) would tie it up with a series of punitive amendments (Congressional Quarterly Almanac 1987: 20). In particular, the sponsors worried that legislators from the far-right wing of the Republican Party would defy their leaders and attach amendments requiring wide-spread mandatory testing for HIV antibodies (Congressional Quarterly Almanac 1987: 491).

Over the next ten months as the impact of the AIDS epidemic spread and the country moved into an election year, support for S1220 within the Senate increased. By the time the leadership had decided to bring the bill up on the floor of the Senate, a total of fifty-seven senators had signed on as co-sponsors. The fact, that the floor managers of the bill, Senator Edward Kennedy and Senator Orren Hatch (Republican Utah), represented the chamber's liberal and conservative wings, underscored the degree of bipartisan support for passing comprehensive AIDS legislation. Senator Kennedy in his introductory floor remarks thanked Republican Senators Arlen Specter (Pennsylvania), Robert Dole (Kansas), and Pete Wilson (California) for their assistance in building support for the bill (Kennedy, Congressional Record, 100th Congress, 2nd. sess., April 27, 1988: S4937).

Senator Hatch directed his initial remarks towards his fellow conservatives, especially Senator Helms. He began by pointing out that since the committee had recommended passage of the bill an additional 20,000 people had been identified as having the syndrome, and then asked that the bill be passed without amendments (Hatch, Congressional Record, 100th Congress, 2nd. sess., April 27, 1988: S4939). The appeal failed to sway Senator Helms, who proceeded to introduce eleven separate amendments, most of which were clearly designed to halt

---

[12]Five other senators had signed on as co-sponsors by the time that S1220 was introduced into the Senate. These co-sponsors were Alan Cranston (Democrat, California), Barbara Mikulski (Democrat, Maryland), Christopher Dodd (Democrat, Connecticut), Howard Metzenbaum (Democrat, Ohio), and Claiborne Pell (Democrat, Rhode Island).

passage of the bill. Senator Helms summed up his feelings towards homosexuals and the sero-positive individuals when he said, "...let us establish one fact about the AIDS epidemic. I agree with what amounts to the Biblical injunction that we should hate the sin and love the sinner. I may not love the sinners. I do not say that I can go that far, but I sympathize with anyone who has a terminal disease, however he or she gets it. But there is not one case of AIDS on record in this country that did not have its origin in sodomy" (Helms, Congressional Record, 100th Congress, 2nd Sess., April 27, 1988: S4944).

On April 28th Senator Helms proposed amendment 1992 which was designed to halt federally funded safe(r) sex education directed at gay men. The amendment stated," Notwithstanding any other provision of this Act or an amendment made by this Act, none of the funds provided under this Act or an amendment made by this Act shall be used to provide education, informational, or risk reduction materials or activities to promote or encourage, directly, homosexual activity" (Congressional Record, 100th Congress, 2nd. sess, April 28, 1988: S5035). If passed this amendment would have severely curtailed the ability of groups to successfully reach the gay community with safe(r) sex materials since virtually any explicit descriptions of homosexual activities would be considered as promoting it. For example, Senator Helms argued that an educational safe(r) sex comic produced by the Gay Men's Health Crisis was "demeaning, disgusting garbage" and their video showing how to put a condom on a penis encouraged "immoral" and "illegal" behavior (Helms, Congressional Record, 100th Congress, 2nd sess., April 28, 1988: S5046).[13]

When Senator Kennedy described amendment 1992 as a "killer," he was referring not only to the possibility that it would halt (i.e., kill) the passage of S1220, but also that it would result in more Americans dying from AIDS (Kennedy, Congressional Record, 100th Congress, 2nd sess., April 28, 1988: S5043). For these reasons Senator Kennedy moved that the amendment be tabled (i.e. removed from consideration by a procedural vote.) If a motion to table is successful, the proposal under consideration is defeated, but the senators have not been forced to actually vote on its substance (Olezsek 1989: 11). Kennedy hoped to use this procedure to halt Helms without forcing senators into the politically costly position of appearing to promote homosexuality by voting in favor of safe(r) sex education directed at the gay community. However, this tactic failed when the motion to table was defeated by a margin of 22-73 (Congressional Record, 100th Congress, 2nd. sess., April 28, 1988: S5048.)

Following the defeat of the Kennedy motion, the Senate immediately moved to vote on the amendment. Once again a majority of Republicans and Southern Democrats united against a majority of Northern Democrats. The vote on the Helms amendment prohibiting the use of federal funds for AIDS education that "promote or encourage, directly, homosexual activity" passed 71-18 on April 28, 1988. A majority of the co-sponsors of S1220 actually voted in favor of the "killer" amendment. Despite his plea against including amendments of this sort, Senator

---

[13]A similar video demonstration with Ruben Blades demonstrating how to put a condom on a banana prompted a protest letter from an International Banana Association spokesperson, who argued, "The choice of a banana rather than some other inanimate prop constitutes arbitrary and reckless disregard for the unsavory association that will be drawn by the public and the damage to our industry that will result therefrom" (Crimp 1988: 255).

Orren Hatch ended up voting in favor of the Helms' amendment. Like many other senators he was afraid that voters in his state would not accept it if he appeared to vote in favor of promoting homosexuality.

Senator Edward Kennedy quickly moved to blunt the impact of the Helms education amendment. He proposed amendment 1996 which would have included the following language in the bill, "Education programs that receive funds under this Act shall stress the public health benefits of a single monogamous relationship and the avoidance of unlawful intravenous drug use. Notwithstanding any other provision in this Act nothing shall restrict the ability of the education program to provide accurate information on reducing the risk of becoming infected with the etiologic agent for AIDS" (Congressional Record, 100th Congress, 2nd. sess., April 28, 1988: S5056).

Senator Jesse Helms immediately attacked the proposed amendment. He argued quite rightly that if passed, the effect of the new amendment would be to completely undercut the amendment prohibiting the use of funds to educational programs that "promote or encourage" homosexual activity (Congressional Record, 100th Congress, 2nd. sess., April 28, 1988: S5056). Helms was also strongly opposed to the Kennedy amendment's language encouraging monogamous relationships. He was morally outraged by the support for "shacking up" and for "homosexual monogamous relationships" (Congressional Record, 100th Congress, 2nd. sess., April 28, 1988: S5056-8).

Fellow conservative Republican Orren Hatch attempted to win support from Helms and other conservatives by arguing, "Now, it is one thing, I call my friend's attention to this, it is one thing that he and I both wish that there were not homosexuals. He and I both wish that we could get everybody to live decent, moral lives in a marital relationship...But to make a long story short, it is common knowledge that there are large numbers of people in our society who need this bill, who need the help. And the principal people who need it are homosexual and bisexual males, according to the statistics" (Congressional Record, 100th Congress, 2nd. sess., April 28, 1988: S5057).

Following an extensive Senate debate, Senator Helms moved that Senate table the Kennedy amendment, and allow the language from his amendment to control the form of educational materials funded by the federal government. The motion to table was rejected by a 61-29 margin. Virtually all of the co-sponsors of S1220 including those who had voted in favor of the original Helms amendment voted against tabling the Kennedy amendment. The implication of this reversal is that very few senators actually wanted to curtail safe(r) sex educational efforts in the gay community as would have occurred with the Helms amendment, but they did not want to be placed in the position of appearing to cast a pro-gay vote.

Immediately afterward, on a voice vote, the Senate passed the Kennedy amendment, thereby superseding the Helms anti-gay amendment which had been passed on a roll-call vote (Congressional Record, 100th Congress, 2nd. sess., April 28, 1988: S5062). There are two very important lessons that can be drawn from this action. First, a large majority of senators are willing to enact policies that are favorable towards the gay community. But secondly, these same senators are not willing to risk their political base by taking a publicly pro-gay stance. This implies that gay activists will either need to pursue a behind-the-scenes legislative strategy or convince senators that it is not politically risky to support pro-gay initiatives.

After agreeing to the Kennedy amendment, the Senate passed S1220 by a 87-4 margin.

The only senators voting against the bill were William Armstrong (Republican, Colorado), Jesse Helms (Republican, North Carolina), James McClure (Republican, Idaho), and Malcolm Wallop (Republican, Wyoming) (Congressional Record, 100th Congress, 2nd. sess., April 28, 1988: S5071-72). Since in a bicameral legislature both chambers needed to pass the same legislation, attention then shifted to the House of Representatives. On September 23, 1988 the House passed a similar measure, HR5142. Normally differences between the two chambers are resolved in a conference committee where legislators from the House and Senate iron out their differences and then the new language must be voted on by each body. However, Senator Jesse Helms was able to prevent this from happening. With the end of the legislative session fast approaching, Helms was able to use the threat of a filibuster to prevent the appointment of members of the Senate to a conference committee (Congressional Quarterly Almanac 1988: 306).

Despite this maneuvering, Helms was not able to prevent the enactment of AIDS education and treatment legislation. Strong majorities from both the House and the Senate wanted AIDS legislation passed and introduced new identical bills into both chambers and managed to pass them without amendments, thereby circumventing Helms. However, Helms won a partial victory because the language is the new law was closer to that favored by conservatives. House provisions assuring confidentiality of test results and counseling for those taking the HIV test were eliminated from the new law. Helms was also successful in getting language barring the use of federal funds for educational materials that "promote or encourage, directly, homosexual activity" included in the appropriations law that actually provided the funding for these programs (Congressional Research Digest, 100th Congress, 2nd. sess., Public Law 100-436, approved September 28, 1988: 225).

As can be seen, the history of the bill supports our hypothesis that voting on gay issues is best characterized as the politics of concealment. The key event that cannot be well explained by any of the other approaches is the switch on the vote to table the Kennedy amendment. When given suitable cover large numbers of senators switched from opposing the dissemination of safe sex material for gays to supporting it. This does not fit with the view that senators always cast their vote as the majority of their constituents want. It is even less in accord with the idea that they are consistently guided by the votes of small well organized groups, as such groups would not be fooled by the language of the bill. Finally it says that senators' ideologies did not prevent around forty percent of the Senate from voting one way on one vote and the other way on the next vote.

In contrast the events fit well with the hypothesis that gay voting is characterized by the politics of concealment. Looked at from this perspective one has a number of senators who are more pro-gay than their constituents, or who are more likely to feel that preventing AIDS deaths takes priority over other issues. When forced to vote on an issue that appears to align them with the promotion of homosexuality they vote against gays. But when allowed to vote on the same issue, phrased in language that does not refer to gays, they change their vote.

Description of the Quantitative Study and Methodology

While the account above supports our hypothesis, case histories, by their nature, are subject to the problems outlined in the second section of this paper. We therefore think it useful

to perform a roll-call analysis of the three gay related amendments to the 1988 Senate AIDS bill (S1220) to test our hypothesis that voting on gay related issues is best explained by the politics of concealment. While we expect all of the traditional reasons for voting to have some influence, we expect the politics of concealment to be the most important explanation.

Few things are harder to demonstrate than an attempt to conceal one's motives. There is no direct indicator of concealment. Rather we claim that legislators will have different voting patterns on bills that provide concealment from those that do not. The influence of constituency factors should be greater in proportion to the visibility of the vote. Where the nature of the amendment forces the legislator to take a highly visible position on gays, constituency characteristics should be an important determinant of the vote. Where the amendment is phrased in a way that it does not deal with gays explicitly, the influence of constituency characteristics should decrease.

The three votes that we consider range from highly visible to almost invisible. The most visible is the vote on Helms' amendment 1992 which banned the use of funds "to promote or encourage, directly, homosexual activity." The phrasing of the amendment appears to imply that those voting against the amendment wish to promote homosexual activity.

Somewhat less visible is the vote on a motion by Kennedy to table this amendment. While this would have had the effect of killing the amendment, formally, tabling only means that the amendment would not be considered at this time. Therefore it would be possible for someone voting for the motion to table to claim that they simply wished to postpone consideration of the amendment.

Least visible is our third vote, a Helms motion to table Kennedy's amendment which was intended to reverse the just passed Helms amendment. The reader will recall that this amendment supported monogomous relationships, opposed drug use, and added "Notwithstanding any other provision in this Act nothing shall restrict the ability of the education program to provide accurate information on reducing the risk of becoming infected with the etiologic agent for AIDS." This amendment has the effect of cancelling the Helms amendment. But, as can be seen from the language, someone voting for the amendment, far from seeming to be in favor of promoting homosexuality, now seems to be in favor of monogamous relationships, against drug use and in favor of providing accurate information. The motives of someone voting against tabling the motion are even more obscured. A legislator could reasonably claim that he opposed the amendment and was eager to vote against it, if his vote were questioned.

We have used a variety of variables to measure the general approaches discussed above. To measure ideology of the member we used scores compiled by the American Civil Liberties Union (ACLU). They used a 1-100 numerical scale to show how closely the legislator's previous votes fitted their own position on votes important to them. For example, if the ACLU gives a senator a score of 75 it indicates that senator votes for ACLU positions three-quarters of the time and against their position one quarter of the time. We also experimented by replacing the ACLU score with those of other groups such as the ACU and the ADA but found the ACLU score to have the most predictive accuracy.

To assess the effect of smaller focussed constituency groups we used two types of measures. To ascertain the importance of gays to the senator we used two proxy variables designed to estimate the number of gays in a state. We used two different measures because there is no generally accepted means of counting gays and lesbians. One proxy, taken from a

data set supplied by the Centers for Disease Control was the number of AIDS deaths in each state traceable to homosexual transmission. We thought that this would capture not only the number of gays but also the intensity of the AIDS scourge amongst gays. The major defect of this measure is that it is not a good measure of lesbians. Our second proxy for the number of gays was Census Bureau figures on non-family members sharing a household. The National Organization of Gay and Lesbian Scientific and Technical Professionals (NOGLSTP) have found that when they use these figures to calculate the percentage of such households in each state, there is a high correlation with congressional districts that have a high concentration of gays and lesbians. We found that in all three of the votes we examined the latter had superior predictive value, so we used it as our measure of the size of the gay population.

Because the focussed opposition to pro-gay legislation comes from small groups affiliated with the religious right, we used a variable designed to measure the strength of the religious right in the state. We used the percent of people in the state belonging to one of the six major conservative Protestant churches.

We also used two measures designed to tap the general attitudes of the population of the state towards liberal issues and towards discrimination. Perhaps the broadest measure of the general liberalism of the state on political issues is the party identification of the state's legislators. The easiest way to tap this is to control for the party of the senator voting. There is however general agreement that as a measure of a state's political liberalism, party identification has a fatal flaw, namely that Southern Democrats and Northern Democrats are not equally liberal. To allow for this we created a conservative coalition variable in which a senator was given a score of 0 if a Northern Democrat, 1 if a Southern Democrat and 2 if a Republican. We used both the standard party variable and the conservative coalition variable in our runs, and found, as expected, that the conservative coalition variable had superior predictive power in each of our runs. This led us to drop the standard variable and report only the conservative coalition results.

The other majoritarian measure was the presence of anti-discrimination laws covering gays in the state. We reasoned that in states which had passed such a law, the majority was likely to be more opposed to discrimination than the majority in states which had not. We also felt that the stronger the law, the more opposed to discrimination the majority would be. This variable was coded 1 where there was no anti-discrimination law, 2 where there was a partial law and 3 where there was a comprehensive law.

We also tried a variety of socio-economic constituency variables which have proved to have predictive value in other voting studies. We did not expect these to predict well in this case and they did not. We therefore do not report them.

Because the three dependent votes are dichotomous we used logit analysis, rather than regression analysis to determine the relative influence of the independent variables. We also recoded the variables so that a positive coefficient always shows that the variable led to support for the gay position and a negative coefficient always shows a variable reduced support for the gay position.

The Results

We started with the equation...

$$VOTE = a + b_1ACLU + b_2GAY + b_3RELIG + b_4CON + b_5LAW + e$$

where VOTE is the outcome on the amendment, ACLU is the senators ACLU score, GAY is the number of gays, RELIG is the percent of the state's population belonging to a fundamentalist church, CON is the conservatism of the senator's party membership and LAW is the presence and strength of a state anti-discrimination law.

Table 1: Determinants of Voting on Three Amendments to the 1988 AIDS bill

Variable	Helms amendment vote	Kennedy motion to table Helms amendment	Helms motion to table Kennedy amendment
ACLU	0.185 (0.010)	0.097 (0.002)	0.089 (0.02)
GAY	105.663 (0.025)	41.972 (0.056)	-2.049 (0.868)
RELIG	0.155 (0.194)	-0.035 (0.678)	0.036 (0.267)
CON	3.421 (0.030)	1.871 (0.025)	-0.364 (0.563)
LAW	3.391 (0.022)	1.452 (0.056)	0.178 (0.267)
Constant	-52.308 (0.011)	-22.565 (0.005)	-2.058 (0.604)
Pseudo R^2	0.70	0.56	0.51
Percent of Correct Prediction	91.7%	92.2%	82.4%

Columns 2-4 of Table 1 show the coefficients for each of the three runs with the significance level of the t scores in brackets. As can be seen RELIG, the proxy for pressure by fundamentalist groups on gay votes, is not significant on any of the three runs. This is consistent with our earlier view that the focussed opposition on gay issues is less organized and powerful than political activity by organizations representing gays. Because this variable was not significant on any of the runs we dropped it from all three runs. We then re-ran the three equations with this variable removed. With this variable removed the coefficients on the variables predicting the votes on the Helms amendment and the Kennedy motion to table the Helms amendment were all significant at the .05 level or better. The new results are shown in columns 2-3 of Table 2. The re-run on the last of the three votes, the Kennedy amendment, left all but one variable, the ACLU score, insignificant at any plausible level. We then dropped each

variable in turn, always choosing the least significant variable to drop. All variables except the ACLU score dropped out without reaching significance at the .10 level. This left us with the result shown in column 4 of Table 2. Each of the three runs shown in Table 2 explains a reasonable amount of the variance.

Table 2: Determinants of Voting on Three Amendments to the 1988 AIDS bill - Revised			
Variable	Helms amendment vote	Kennedy motion to table Helms amendment	Helms motion to table Kennedy amendment
ACLU	0.146 (0.007)	0.102 (0.000)	0.089 (0.000)
GAY	76.637 (0.005)	45.008 (0.001)	
CON	2.639 (0.035)	1.959 (0.018)	
LAW	2.517 (0.025)	1.545 (0.037)	
Constant	-38.438 (0.005)	-24.136 (0.001)	-2.216 (0.000)
Pseudo R^2	.68	.56	.48
Percent of Correct Prediction	95.2	92.2	82.4

As can be seen the coefficients are all in the expected direction, with the exception of the coefficient for the modified party score. On all three votes the more liberal the senator the more likely he was to support the gay position. On the first two votes constituency variables were also important. Those senators with more gays in their state were more likely to take the pro-gay position. Those senators from states with anti-discrimination laws were also more likely to support the gay position. The one unexpected coefficient is that for party (CON) in the first two votes. It shows that equally liberal senators, with equal numbers of gays in their state, and with equal anti-discrimination laws were more likely to support the gay position if they came from the more conservative party.[14] One possible explanation is that a minority party has more incentive to seek out groups to add to its coalition. In addition we note that The Log Cabin Clubs, a grouping of gay Republicans, have long urged their party to support gay issues on libertarian grounds.

To what degree do the results shown in Tables 1 and 2 support the hypothesis advanced above? As can be seen they are highly consistent. Looking at Table 2 we can see that as we

[14]Because Northern Democrats are in fact more liberal than Republicans and Southern Democrats this result is misleading. In runs not controlling for ideology we found the expected significant negative relation between party and being in favor of pro-gay legislation.

move from the voting on the more visible Helms amendment to voting on the somewhat less visible motion to table that amendment, the size of the coefficients on the constituency variables drops by almost half. While both runs show the effects of the three constituency variables, the size of the gay population, the presence of an anti-discrimination law and the party of the senator, the effects are much more important when it appears that the senators are voting on the promotion of homosexuality.

An even more dramatic difference can be seen when we move from the somewhat visible Kennedy amendment to table the Helms amendment to almost invisible vote on the Helms motion to table the Kennedy amendment. The reader will recall that the wording of the Kennedy amendment strongly disguises the fact that it is a vote to override the anti-gay wording in the Helms amendment, and the fact that it is a motion to table that amendment further obscures matters. We can see that this lessened visibility virtually wipes out the restraining effects of the constituency variables. Comparing column 3 to column 4 we can see that all the constituency influence visible in the Kennedy motion to table the Helms amendment has vanished in the vote on the Helms amendment to table the Kennedy amendment, despite the fact that the two votes were essentially intended to do the same thing.

Also consistent with the hypothesis is the generally decreasing amount of the variance explained as we move from the vote on the Helms amendment to the vote to table the Kennedy amendment. The run seeking to explain the voting on the Helms amendment has a pseudo R^2 of .68 and would enable us to predict the vote successfully 95 percent of the time. The run explaining the voting on the Helms motion to table the Kennedy amendment has a pseudo R^2 of .48 and would enable us to explain the vote successfully 82 percent of the time.

Support for the hypothesis is bolstered by a closer comparison of the two extremes on our continuum, the voting on the Helms amendment and the voting on the Helms motion to table the Kennedy amendment.[15] The reader will recall that the Helms amendment sought to ban any actions to stop AIDS that might have the effect of promoting homosexuality. While this might seem at face value to be a purely symbolic motion, it actually had real consequences preventing several strategies, such as promoting the use of condoms in gay sex, which were thought to be helpful in slowing the spread of the disease. The Kennedy motion to table was essentially an attempt to prevent this motion from passing by providing political cover to those who wanted to save the lives of gays. But Kennedy motion to table failed and the Helms amendment then passed. The Kennedy amendment, although phrased in general terms, was actually an attempt to nullify the Helms amendment, which the Senate had just passed. Indeed Senator Helms said exactly that in his speech on the Kennedy amendment. Thus we have three votes all dealing with the some point and differing only in the degree of cover they provided to those voting.

Given this the results of the voting are quite startling. The Helms amendment passed by a vote of 71 to 18, seeming to indicate that 80% percent of senators voting supported his

---

[15]The reader might reasonably ask why we are not comparing the vote on the Helms amendment with the vote on the Kennedy amendment. The most obvious reason is that the final vote on the Kennedy amendment was a voice vote, with no record kept of who voted for it. However even if it had been available for analysis, the Helms motion to table better represents the extreme of the visibility continuum.

position. But the results were completely different when cover was provided. The motion to table the Kennedy amendment, which one would have expected to garner over 70 votes instead only garnered 29, with 61 senators voting to support the amendment. No less than forty senators changed from the anti-gay to the pro-gay side.

Further the senators who switched were disproportionately those who one might expect to do so. Their mean ACLU scores of 53 were in between those who voted consistently against gays, who had a mean ACLU score of 15, and those who voted consistently for gays, who had a mean ACLU score of 82. These were senators who did not feel strongly enough either way to allow their personal beliefs to override constituency pressure. And there was also evidence that this group was likely to face such pressure. There were disproportionate numbers of switchers amongst Southern Democrats, amongst those without an anti-discrimination law in their state, and amongst those without large numbers of gays in their constituency. This reinforces the idea of a group seeking political cover.

While the results clearly support the politics of concealment hypothesis, it might seem that they also provide support for the third of our hypotheses, that ideology is the primary determinant of the vote. In each of our three runs, the ACLU vote was the major variable, and unlike the others it did not drop out as we moved from the two votes on the Helms amendment to the vote on the Kennedy amendment.

However in our view such a conclusion would not be fully accurate. Putting on one side the arguments about the degree to which measures such as the ACLU vote actually measure ideology (Jackson and Kingdon 1992), we would make two observations about the data at hand. The first and least important is that the coefficient on the ideology variable declines as we move from visible to less visible votes. However there is a much more important point. If we compare the ACLU coefficient on the second and third votes there is not a great deal of difference between them. However, despite this, almost forty percent of the Senate changed its vote between one vote and the next. Looking only at the coefficients on the ideology scores would not enable us to predict or explain this major switch. While we would not deny that ideology has some effect on voting on gay issues, it seems clear to us that the degree of concealment is a more important explanation.

Conclusion

This study has provided important insights into the determinants of Senate voting on gay-related policies. As we hypothesized, voting on gay issues cannot be explained by a simple uni-dimensional spatial model. Instead a combination of variables designed to measure the senators personal belief system and constituency characteristics were needed on votes where it was evident that gays might benefit. We found little evidence of influence by the organized opposition, but some evidence to support the idea that organized gays have some influence on such votes. We also found evidence to support the idea that on visible votes senators pay considerable attention to the view of the majority in their constituency.

We also discovered that senators were profoundly affected by the degree of public accountability associated with their votes. Only a relative handful of senators were willing to publicly cast what was perceived to be a pro-gay vote. However, many more senators were willing to take pro-gay positions when their voters were not likely to discover they had taken

such a stance. Following Helms' speech against the Kennedy amendment, it is hard to imagine that any senators did not understand that they were voting to essentially reverse their preceding anti-gay vote. By rejecting Helms' motion to table the Kennedy amendment and later casting a voice vote in favor of the amendment, a large minority of senators indicated that their private position was far more favorable towards the gay community than their public one.

Two more general points can be drawn from our findings. One is that concealment may well be the best strategy for those supporting gays in the legislative area. Given the difference between the private and public positions of many legislators, gays should be more successful when bills seeking to realize their goals are couched in universalistic language that does not mention them explicitly.

The second point is a more general one. Institutional and tactical moves within legislatures which seek to conceal what is happening from the general public are often viewed with suspicion by those who seek policies in the public interest. It is often thought that once votes are removed from public scrutiny there are no safeguards to prevent legislation that benefits special interests and individuals at the expense of the public. This paper shows a different side to the concealment coin. On issues where the majority is wrong, or where it is easy to obfuscate the truth (eg taxes on the wealthy) concealment, far from harming the public, may actually benefit the commonweal.

#1. Preliminary Remarks: A Non-Totalizing Critique of Post-Modernism

In this paper I will explore whether postmodern theorists of a "politics of difference" advance a coherent vision of an emancipatory politics which transcends the need for a commitment to "Enlightenment" conceptions of equality and the universal rights of citizens. (I will take as paradigmatic works Iris Young's recent Justice and the Politics of Difference and the work of Ernesto Laclau and Chantal Mouffe). In addition, I will examine the claim made by both postmodern and anti-foundationalist "democratic pragmatists" (explicitly Richard Rorty, implicitly Benjamin Barber) that a rejection of a foundationalist epistemology (the belief that there are certain a priori truths given by the structure of human reason or experience) is central to a philosophical and political commitment to the open structure of democratic societies. I hope to develop two distinct, but related arguments. First, contrary to the claim of advocates of a "politics of difference" that they eschew any commitment to a universal conception of human interests, their belief that it is in the interest of subaltern groups to fight for greater control over their lives is predicated on a universal, democratic commitment to the equal moral worth of human beings. After all, why should we protest if one group has greater access to resources or life opportunities unless we believe that each member constituting the group is worthy of equal consideration to individuals who belong to other groups?[1] In short, I will hold that a commitment to a radical democratic pluralism is parasitic upon "Enlightenment" beliefs in individual rights and the equality of democratic citizenship. (How individual rights yield a commitment to group rights is an issue I will briefly explore in my comments on Iris Young's work.)

Secondly, I will argue that there is no coherent theoretical or empirical relationship between epistemological approaches to political theory and operative political conclusions.[2] That

---

[1] This is not to say that advocates of a "politics of difference" have adequately grappled with the most radical implications of post-modern theory for the concept of group identity. If groups can share certain identities based on shared historical experiences then individual identity can't be as fractured and as decentered as the most radical advocates of post-modernism claim. If we can't even know who we are -- changing from subject-position to subject-position -- how can we identity with others as sharing our identity? The other danger, of course, is that group identity can essentialize individuals. To cite just one example, not all "people of color" (an essentializing identity if one ever "saw" one) conceive themselves to be "people of color" not do they all believe they share the same ethnic, racial, gender, linguistic, class, or sexual preference identity.

[2] A quick review of contemporary theory provides striking prima facie evidence against any claim of a coherent relationship between epistemological and political perspectives: Robert Nozick, John Rawls and Susan Okin all operate out of a post-Kantian tradition (Kant minus the metaphysics of the noumenal and phenomenal realms), but the first is a libertarian conservative, the second a liberal democrat, the third a feminist social democrat. Jurgen Habermas and Seyla Benhabib both merge aspects of Kantianism and pragmatism in their development of an ethics of "universal pragmatics", yet Benhabib offers a feminist critique of how Habermas draws the distinctions between public and private and between public interests and private moral norms. Finally, Michael Sandel, Leo Strauss and Alasdair MacIntrye all adhere to neo-Aristotleian conceptions of thee communal embeddedness of individual identities. Yet Sandel might loosely be described as a democratic communitarian and Strauss a conservative communitarian. MacIntyre is a nostalgic pre-modernist who claims to transcend left-right boundaries, contending that moral virtue can only be instantiated in small, non-instrumental communities. Feminist postmodernists such as Judith Butler or Jane Flax who assert that the epistemological skepticism

is, there have been and will always be Kantian and pragmatist democrats, skeptical and naturalist conservatives. Not that there isn't a coherent relationship between a theorist's (and a citizen's) belief in the capacity and potentiality of human beings and the type of political order and institutions which they assert best fulfills those capacities. These issues are at the heart of political theory and practice. But such conceptions can be founded upon either religious or ethical cosmologies or historicist or pragmatist observations about human practices. The theory of knowledge implicit in one's claims about the human condition does not appear to determine these beliefs about human potentiality and the proper structure of institutional life (the core beliefs of any political philosophy).

One might discern from my positions one and two that I would be sympathetic to the project of "universal pragmatics," which attempts to ground a politics of radical democratic pluralism in a commitment to the shared understandings of a democratic community. That tradition, which Seyla Benhabib's latest work, Situating the Self: Gender, Community and Postmodernism in Contemporary Ethics, tries to open to the most reasoned insights of feminist, communitarian and post-modern thought, however, is also, at times, guilty of attempting to ground a politics in an epistemology. The ideal speech situation is a useful metaphor for the respect merited by each member of a democratic community (as are certain interpretations of "the original position"). But speech situations need not be mutual and democratic -- often they can be manipulative or reflect institutional or physical domination. Metaphors are useful for explaining what one means by the reciprocity and mutual respect of a democratic community. But such communities are only established through the political argument and political struggle of ordinary citizens -- and never solely by the theorist who offers the best heuristic or metaphor for describing the aims of such a community.

For those sympathetic to a post-modernist and/or feminist perspective on the issues discussed below, perhaps one final introductory note is needed. While I will argue that democratic advocates of a "politics of difference" end up -- if they maintain their commitment to democracy -- being more dependent upon universalist commitments to liberal tolerance and the equal moral worth of citizens then they care to admit. Yet there is no doubt that what Benhabib terms the "weaker" versions of post-modernist arguments have had a salutary influence upon theorists working out of a radical democratic and feminist tradition. These "weaker" versions of the "death of man", "death of history" and "death of metaphysics" correctly caution against the biases implicit in essentialist conceptions of human nature, teleological views of history which privilege one subject, and metaphysical conceptions of representation which claim to correspond to a world beyond history and change. But as Jane Flax's, Thinking Fragments: Psychoanalysis, Feminism and Postmodernism in the Contemporary West, demonstrates, a "strong" version of postmodern theory cannot be uncritically appropriated by those still committed to the possibility of democratic political transformation. An unrestrained Foucauldian analysis of how power/knowledge matrixes construct human subjects and truth so radically denudes the possibility of individual agency that it is hard to imagine how normative and political critiques of domination remain possible. If there is no "doer behind the deed" other than subject-positions constructed by discursive practices, then the possibility for democratic agency seem as pessimistic in post-modern thought as it did in the structuralist analysis which post-modernism critiqued as overly deterministic. That is, in its

---

of a Nietzscheian perspectivism has emancipatory implications for women would heed well Seyla Benhabib's warning in Situating the Self that the Nietzscheian will-to-power not only has clear nihilist implications, but celebrates traditional male conceptions of imposing one's will on the world.

extreme form the smashing of the metaphysics of presence can be as disabling a meta-narrative as any teleology generated by the Enlightenment tradition. Perhaps it was a rejection of the most extreme readings of his work that led Foucault in his last writings and interviews began to speak more favorably of the spirit (if not the metaphysics) of the Enlightenment project and of the responsibility of truth to critique institutional power. (See the essays "What is Enlightenment and "Polemics, Politics and Problematizations" in The Foucault Reader, ed. Paul Rabinow.)

#2. Can an Epistemology Determine a Politics?

Many self-described postmodern and pragmatist political theorists contend that an anti-foundationalist epistemology hostile to any "meta-narratives" about human nature and history yield a sounder commitment to the openess of democratic practices than do Enlightenment "foundational" claims about the rational capacities of humans. Yet these claims as to either the decentered or communal constitution of the self pose, in their own fashion, a new meta-narrative: that anti-foundational epistemology best grounds a democratic politics. In response, we might pose two queries. First, can democratic societies function on the basis of non-universalist or decentered conceptions of the self or must a democratic culture share certain normative conception about the value of human agency and choice? Secondly, can the demands that particular groups make for respect of their identity succeed in the absence of cross-group alliances based on a universal, shared conception of the identity of democratic citizens?

In regards to the first inquiry, do not defenders of democracy (implicitly or explicitly) contend that human beings are of equal moral worth and are the best judges of their own interests? Now this claim could be grounded religiously, historically, or pragmatically (democracy may be the best of all imperfect political systems that our culture knows). But democratic practice involves a commitment to some narrative account of why democracy is in the interest of human beings, at least as compared to authoritarian regimes. That is, democracy cannot be agnostic as to its own moral worth. Moral commitments need not be grounded in grand meta-narratives about human rationality or "backed by noninferential, intrinsically credible elements in experience to justify claims about experience." (Cornel West, p. 269, in Andrew Ross,ed. Universal Abandon) But the practice of democracy involves ethically treating each individual in accord with their moral desert (of course, who counts as a full citizen and how to guarantee the exercise of full citizenship rights is an issue confronted daily by anti-racist and feminist movements.)

As to the second query, a rejection of an essentialist notion of human identity or even a conception of stable, permanent human identities does not deny the possibility of communication or alliances across these shifting identities (although it does imply that these groups share some common culture of communication). We need not argue how extensive that sphere may be, but even communitarian and post-modern theorists must believe they are writing for a heterogeneous, "multi-cultural" audience which shares sufficient cultural understandings to comprehend their arguments. While the shared interests and identities of a democratic polity are not ontologically given or epistemologically discoverable, they need to develop through concrete historical experience if that democratic society is to be capable of reproducing itself. If those experiences do not produce some sense of common interests and valued, shared democratic practices it is unlikely that the claims of marginal groups to be included will be heard. (One could make the claim that suburbanization and the emergence of a small, but significant African-American middle class may have marginalized inner city residents until the time when there is a resurgence of inner city political resistance and of the democratic sensibilities of citizens living outside the inner city.)

When and if an excluded group believes it cannot make any moral claims upon those members of at least a formally democratic polity who have previously excluded them, the excluded communities are likely to experience political alienation, apathetic disaffection or (less likely) revolutionary resistance. But if democratic political action -- or resistance -- aims to reshape the normative assumptions and exercise of power by others, then resisting groups must believe (supported by historical evidence) that mobilization and protest can make claims on the conscience (or at least behavior) of certain crucial members of the flawed democratic polity who have previously not responded to their demands. Thus, when advocates of the politics of difference advocate empowerment of excluded groups, unless they embrace the despairing abstentionism of the late Marcuse, they must believe that alliances can be constructed in imperfect democracies between the excluded and some of those who have greater influence over the distribution of cultural, economic and political resources. Otherwise, the politics of resistance is reduced to a politics of abstentionism, secessionism, revolutionary oppositionism -- or simply the self-affirming cultural protest (usually by self-appointed intellectual tribunes of those who can least afford to be excluded from the rights of democratic citizens.)

#3. Avoiding the False Polarity of Universality or Particularity

This alleged antinomy between universality and particularity is not only theoretically questionable, but it also fails to grasp one of the key problematics of that tenuous project known as democracy -- building community through the shared participation of diverse groups. Unity and particularity cannot be radically counterposed in a complex democratic, pluralist polity; rather democratic solidarity must be achieved through a shared public life among particular groups and interests. The excessively solidaristic project of virtuous communitarianism harks back to a restrictive, Aristotleian conception of the good which denies the plurality of modern conceptions of the good life. On the other hand, the postmodern celebration of fragmented, particular identities denies the reality that human emancipation can only occur in a democratic context in which diverse groups recognize the just claim of other constituencies upon those common public resources and practices necessary for the development of plural communities. The flourishing of difference on a terrain of structural inequality will only result in those communities possessing less economic, cultural and political resources having less opportunity to develop the human potential of their members.

The above analysis assumes, of course, that we can distinguish among systems of power as more or less democratic. An extreme Foucaldian reading of power/knowledge discourses denies that power can ever be redistributed in ways that lessen domination. To paraphrase Michael Walzer, all that the establishment of a new system of power/knowledge or discursive practices does is rearrange the bars on the iron cage of domination. If this be the case, however, why is it that movements for emancipation describe their histories in terms of social gains and losses, retreats and advances. Is this false consciousness on their part? Or wasn't part of the postmodernist rejection of crude Marxism a skepticism as to a simplistic doctrine of false consciousness which allowed radical intellectuals to impose their "correct" conception of interests upon subaltern constituencies?

Thus, if disempowered communities strive for more democratic distribution of life opportunities in a democratic polity they must make claims upon fellow citizens who do not fully share their racial, ethnic, sexual or class identity. Doing so successfully involves a dialectic process of asserting the dignity of that particular group while also demonstrating how the denial of

rights to that constituency threatens certain universal rights central to a pluralist democracy. For example, while the Congress of Industrial Organizations fought for the particular interests of industrial workers in the 1930's, it successfully contended that the absence of democracy in the workplace posed a threat to the dignity of all citizens. The civil rights movement grounded an assertion of African-American dignity through an appeal that the denial of African-American rights symbolized the failure of American democracy as a whole. The recalcitrant nature of racism and the paternalist practices of whites within the civil rights movement engendered a Black Power movement which contained elements of radical separatism. But even the mainstream of Black Power demanded those same opportunities for economic and political empowerment that other ethnic and immigrant groups had achieved through the interest group and machine politics of urban America (see Stokely Carmichael and Charles V. Hamilton, Black Power, 1965).

While the impasse of the left since the 1960's probably has more to do with the material and ideological circumstances described below, it is striking that while the labor movement of the 30's and the civil rights movement of the 50s and 60s served as functional surrogates for Marx's "universal class" (a particular class whose specific grievances speak to universal interests) the left since has been identified in the public consciousness with "special interests". The issues which the feminist movement has raised around broader social responsibility in child rearing have the potential for recreating a sense of shared interests across race and class lines. But whether any constituency identified with the left will be identified with broader universal interests remains an open question in this era of social fragmentation. As Todd Gitlin points out this is the first time im in modern history when the right (until just recently) has succeeded in casting itself as the defenders of the public interest, with the "entrepreneurial class" being the surrogate universal class.

The crisis of the politics of emancipation of oppressed constituencies is not only an ideological, discursive one, but also a material one. Conditions of stagnant economic restructuring lead not only advantaged groups, but also middle strata fearing downward social mobility, to reject the demands of the excluded for inclusion. Much of Reagan and Thatcher's political appeal centered on obfuscating their defense of the unrestricted prerogatives of capital by appealing to middle strata and working class resentment against means-tested welfare programs (less than 20 per cent of American welfare state expenditure and only five per cent in the U.K.) which disproportionately benefit the poor. Working class fear of downward social mobility, combined with an ideological belief that individual effort could avoid such fate, lay the material basis for a mean-spirited politics. With continued economic stagnation under conservative governments, it is now harder for the right to portray solidaristic social programs as handouts to the undeserving poor (universal health care and federally financed child care would radically decrease the twenty per cent of American social welfare expenditure that is means-tested). But the structural deficit created by Reagan-Bush, and Democratic fears of appearing weak and defense and overly aggressive in restoring progressive taxation certainly limit possibilities for social reform (as the likely punitive nature of Clinton's "welfare reform" may well demonstrate).

Absent a sustained depression which creates broad solidarity or a sustained period of rapid growth (the 60's) which facilitates the marginalized demanding to share in that prosperity, a politics empowering the disenfranchised is difficult. Perhaps this absence of concrete gains for excluded constituencies partly explains the striking renaissance in cultural celebrations of diversity. Undoubtedly, a cultural and intellectual renaissance can aid the revitalizing of social movements in crisis; but cultural -- disproportionately academic and middle strata -- celebrations of an African-American aesthetic or a feminist ethic of care will not reverse our polity's abandoning of inner cities or of abortion rights for indigent women.

Is this fragmentation of social life a sign of the emergence of a more fragmented,

decentered, post-industrial, post-modern society or is it, in reality, an extreme version of the fragmentation, alienation and commodification of all human relationships which Marx prefigured with the metaphor "all that is solid melts into air" in The Communist Manifesto. David Harvey has argued in The Condition of Post-Modernity that the fragmentation and decentering of the left may in part be due to the segmentation of the labor force of post-Fordist capitalism and the emergence of a capitalist marketing strategy which moves beyond the mass market to niche markets targeting specific regional, age and racial consumer sub-cultures. The centrifugal tendencies of the market and division of labor were not unanticipated by Marx; but he believed that common political action could transform a divided class-in-itself into a unified political class-for-itself. It may well be that the developments of post-Fordist capitalism make this political project more difficult; but does it make it less necessary? Can any particular oppressed constituency secure significant social gains without democratizing broader political, cultural and economic life? Or must the radical vision be pared down to a demand for equal representation based on race and gender within an anti-democratic hierarchical political and economic system? Again, the reconfiguration of a social constituency and program which can build majoritarian support remains a problematic that the "politics of difference" does not begin to address. A politics of resistance may be a necessity in periods of political reaction; but it never can bring concrete gains to a broad majority.

#4. Does the Abandonment of Enlightenment Metaphysics Necessitate the Abandonment of the Emancipatory Project?

Ernesto Laclau and Chantal Mouffe contend that the abandonment of the enlightenment's epistemological position that there are foundational truths supported by the nature of humanity, god, or reason need not necessitate the abandonment of the enlightenment project of radical democracy. That is, we can achieve the political goals of the Enlightenment minus its metaphysical trimmings. Group identity and interests can no longer be deduced, Laclau and Mouffe correctly argue, from assumptions about the structure of society or the telos of history. Instead they assert that the discursive self-constitution of groups (in discursive relationship to others) implied by a postmodern epistemology can rekindle faith in the emancipatory project of self-definition. In a sense, this is their new "meta-narrative" (though they would deny it this status) of "discursive" emancipation. (Whether institutions of social and economic power can be reduced to "discursive constructs" is a question I choose not to engage in here. But, intuitively, hunger and homelessness still strike me more as material realities -- obviously mediated by cultural expectations -- rather than primarily "discursive constructs.") The construction of democratic alliances among inter-textually, discursively constituted groups will, Laclau and Mouffe contend, depend on the construction of hegemonic democratic practices in as many spheres of human activity as possible. Yet, given that they admit that democracy is itself an indeterminate, contestible term, why is there any assurance that the democratic conceptions or interests of subaltern groups will coincide or that the multi-faceted identities of members of these supposedly non-essentialized groups will cohere into group action? Laclau and Mouffe might respond that the construction of a common practice of democracy can only occur through discursive interaction and contestation. But isn't a central part of that discourse an argument as to the mutual respect and shared interests citizens owe to one another across cultural and interest group lines?

The commitment to a purely "discursive" politics assumes both that there are infinite possibilities for political practice (and that subaltern groups share no common, essential interests --

say in fair economic distribution or democratic control over production) and that there will develop hegemonic alliances based on a dominant conception of democracy. But absent any theory of social structure and institutional practices, how can a group or theorist strategize about how best to constitute and unite divergent social groups? That is, without ascribing to social practices, institutions, and interests a meaning beyond the subjective interpretation of their participants, how would any political actor begin to construct a the concrete material and ideological basis for alliance politics? While this politics need not be rooted strictly in material needs, it is not surprising that the basic stuff of cross-cultural coalitions remains the bread-and-butter demands of economic justice (the necessary, but no means sufficient conditions for human emancipation). Witness Jesse Jackson's second, more inclusive 1988 "Rainbow Coalition" presidential campaign (not that it was a real coalition, more a plebiscitarian populism). Of course, democracy itself might be predicated as the moral basis for coalition, as Joshua Cohen and Joel Rogers contend in On Democracy. But this assumes that the democratic interests of differently situated groups can be mediated by some shared aspects of moral identity, if not material interest. Democracy as rhetoric does not specify any specific practices or institutions. But the Gramscian "discursive" alliance politics advocated by Laclau and Mouffe is akin to an ethical socialism, as Aronowitz argues in his chapter in Universal Abandon, which while perhaps not foundational in nature, certainly assumes a shared (if not a priori) common interest across sub-altern groups in increased democratic voice in determining the material and cultural conditions of their lives.

But how do we argue for such a democratic alliance politics except by appealing to certain shared assumptions about our culture -- practices that the interrogators must argue are central to achieving a dignified human life? Whether these standards be cross-cultural or not, foundationally defended or not, they certainly involve universal and critical appeals within our own particular mode of democratic discourse. That is, why should any group fight for emancipation unless they believe it is in their material and moral interest? A democratic ethical perspective need not be grounded in a foundational conception of human nature. The democratic pragmatist position is of long and valued standing. But even that tradition implicitly assumes that such claims will have a majoritarian, multi-cultural validity within our own society. That is, a politics of pure particularism cannot yield a democratic pluralist practice. Laclau and Mouffe cannot be both radical democrats and radical particularists; democracy demands a certain commitment to universal standards of rights and opportunities, even if those standards be discursively and historically constituted (a sociological truism of no particular import in regards to the bite of an argument for those standards. No successful argument made within a society can exist apart from that society. But how universal or particular in nature is the argument -- and that culture -- itself?)

Can advocates of a politics of difference speak of marginalized or excluded groups unless they offer an implicit conception of what it is to be included as a full member of a polity? That is, what are the normative standards by which an observer judges that a group is excluded from certain aspects of social life? And why should equal participation in political life and the garnering of equal respect from other groups in a society be of import to an excluded group? Absent ethical arguments as to why groups ought to have a voice in decisions that affect their lives there can be no coherent conceptions of domination and subordination, exclusion and inclusion. Thus, if the politics of difference strives to empower excluded groups then it implicitly is committed to universal conceptions of democratic practices and human rights. If not, why is exclusion or marginality to be opposed? In the absence of an appeal to universal conceptions of human dignity, what is wrong with some groups experiencing their "difference" as political, cultural and/or economic marginality.

Also, if politics of "new social movements" (not that the women's or peace movements

are so new, not to mention movements based on ethnicity as we replay World War I and II in the Balkans) transcend material issues and focus on questions of group identity and quality of life, on what basis are alliances possible across group identities? Most social movement theorists contend that alliances are constructed through discursive practices which transform the identities of divergent groups? But do they mean that identities are then homogenized -- or fractured into areas of overlapping interest with others? To avoid specifying the concrete shared interests or identity of alliance partners, social movement theorists often speak of a common moral interest in democratic empowerment. But democratic empowerment for divergent groups can yield political and economic demands that are quite divergent. Both within and among non-homogenous, differentiated group identities, democratic mobilization can often split constituencies.

#5. Can Postmodernism Ground a Radical Democratic Conception of Justice

A work which highlights the tension between the postmodern project of proliferation of discourses and subject positions and the emancipatory project of achieving a just social order which grants equal moral respect to each citizen is Iris Young's ambitious work Justice and the Politics of Difference. Young advances a trenchant critique of the inordinate focus of liberal theories of justice on the distribution of goods. Such theories, she argues, assume an atomistic, consumerist conception of the individual and fail to see how social goods are produced by decision-making institutions characterized by a structured division of labor. Young contends that a democratic theory of justice must analyze the structure of social institutions and the division of labor. She holds that justice as the overarching conception of a social order should be viewed as commensurate with both formal and substantive democratic political life.

The virtue of Young's work is that it offers a more concrete political and pluralist vision of Habermas' conception of communicative democracy and illustrates how institutional embodiment of the "ideal speech situation" would erode practices of domination and exploitation (defined as the absence of democratic voice in institutional life and absence of control over one's labor). Young is also more sensitive to the plural nature of group identity in late industrial societies than is Habermas. She locates much of the insurgent activity in favor of democracy in new social movements based on identities of marginality and oppression which fight not so much for distributional reform and incorporation, but for greater voice and respect for their particular identity within the polity. Her vision of a democratic community is not one of homogeneity and uniform rights of citizens, but rather of the heterogeneity and differentiated life styles of a modern, but just city. In her view, the diversity of urban life involves more the mutual toleration of diverse life styles than the demand for homogenous behavior on the part of equal citizens. Such a view of communal diversity mitigates against the tendency of traditional liberal and radical theories of justice to posit the autonomous and rational chooser of democratic society as a disembodied, gendered male voice of dispassionate reason and disinterestedness.

While Young's critique of the disembodied or uniform voice of Kantian theories of justice reiterates an ontological critique made by theorists as divergent as Sandel and Laclau and Mouffe, Young is too sensitive to the intolerant nature of parochial communities to opt for a parochial, traditional nature of community. She, like Seyla Benhabib, opts for a participatory, diverse conception of community rather than the uniform public of republican imagination (Barber, Sandel, MacIntyre). But, Young does not adequately deal with the challenge posed by Benhabib's sympathetic critique (and limited appropriation) of postmodernism. Certainly new social movement advocates offer a powerful critique of the homogenizing and anti-pluralist aspects of the liberal

and radical traditions. But in their metaphorical politics of Rainbow Coalitions or heterogenous, vibrant polities, they eschew the fundamental political (not just metaphysical or ontological) question of what unites these divergent groups' conception of emancipation. For example, why would the end to domination of gay men and lesbian women necessarily entail liberation for straight working class men and women or inner city African Americans? (Not that there isn't a relationship among these emancipatory projects, but it needs to be concretely articualted rather than simply asserted.)

Obviously, Young is sophisticated enough to abandon an essentialist conception of identity and to realize that many individuals experience multiple identities (and not all people shareing the ascribed characteristics of a marginalized group necessarily act upon or share that group identity). But if there are a proliferation of social groups mobilized around their particular identities, as well as many individuals who do not neatly identify with any politicized group, how does one construct a majoritarian democratic public that will support equal political and social rights for each of these groups? And what is it about these groups that necessarily means that their vision of basic needs and democratic procedures will be shared by others. (A quick example: while many gay and lesbian people are African-American, the dominant political and cultural institution in the African-American community -- the church -- has a tradition of homophobia.)

Young cannot avoid the reality that when one critiques the practices of any of these communities (a homogenous white working class community which excludes people of color) one is resorting to quasi-universalist values appealing to equal respect for persons. Now these claims need not be transcendentally defended -- one can appeal to the democratic and liberal traditions of our own contested, multi-cultural culture. But ultimately a democratic project that is going to appeal to the needs of non-essentialized members of the working class, people of color, gays and lesbians, environmental and peace activists would focus on an ideological conception of radical democracy which also has a concrete material program. It is no accident that when a "rainbow coalition" seriously attempts to become a multi-racial, cross-class coalition its demands usually center on those universal social and economic demands associated historically with social democracy. Given the growing cultural import of insurgent identities, a new aritculation of this tradition to be majoritarian will have to be less economistic, more culturally pluralistic and less reductionist about sexual and racial identities than were its predecessors. But what radical democratic pluralism must grapple with is whether it primarily celebrates diversity (which can easily become the next form of American commodified culture) or mediates that celebration by recognizing that fragmentation and narrow ethnic or identity politics threatens the very tolerant, democratic, egalitarian society upon which "postmodern" visions of emancipation implicitly rely. Once that conceptual bridge is crossed then the conception of civil and political liberties necessary to support radical democracy may look a lot more like a radicalized, gender-sensitive version of Rawls rather than the post-materialist, post-liberal "politics of difference."

#6. "Democracy and 'Difference'" -- or How Radically Pluralistic Can Democracy Be?

A further examination of Young's vision of the ideal city and her defense of affirmative action as redress for current, rather than past, oppression reveals the hidden "universalist underbelly" of any radical democratic politics of difference. Young advances no convincing reason as to why individuals who are not members of an oppressed group should support the empowerment of members of oppressed groups. Short of a cross-cultural belief that the treatment of oppressed individuals is unfair (according to certain shared understandings) it is unlikely that

members of non-oppressed groups will concede to demands for redistribution of power and life opportunities (which is essentially her defense of the justice of affirmative action, an issue I will return to in a moment). Young's vision of the ideal city is one of particular communities with distinct identities but which are tolerant of other communities and interact with members of these other communities ("strangers") in the public spaces characteristic of a healthy city. She rejects the tight solidarity of communal visions of "strong democracy" in favor of a radical pluralism where particular communities develop their different identities but also develop the capacity to act as sympathetic (if not empathetic) citizens. Young has a healthy mistrust of more communitarian and republican visions of democracy -- their conception of public life too often privileges one view of community over others. Or to avoid the dangers of parochial communalism these theorists invoke the virtues of community without specifying which virtues these communities defend.

Young is well aware of the parochialism and xenophobia of many traditional communities which frequently constitute the actual less-than-ideal cities of history. But she avoids the perplexing normative and political task of envisioning the basis upon which citizens from particular communities would construct shared bonds of citizenship with "strangers." This is a particularly pressing problem for Young, as her vision of "affirmative action" implies a much stronger sense of a shared vision of social justice than the indifference of city strangers permits. Young contends that the best way of defending affirmative action is to admit that such policies discriminate. Thus, she rejects the standard justification that such programs provide a slight edge for relatively equally "qualified" candidates who come from groups which have been historically discriminated against. Affirmative action, she claims, should not be defended as an amelioration for past injustice (as present citizens are unlikely to accept blame for injustices done by their predecessors), but as a mitigation of the influence of current, often unconscious and unacknowledged, biases. That is, affirmative action policies should openly admit that they are redistributing task-defining positions of power to groups that are presently underrepresented in these positions: "A politics of difference argues..that equality as the participation and inclusion of all groups sometimes requires different treatment of oppressed or disadvantaged groups." (Young, p. 157) But the critical argument Young fails to make is why should members of allegedly non-oppressed groups believe that positions of power should be distributed by openly discriminatory procedures in order to insure that no identifiable oppressed group is underrepresented? Such a viewpoint would either involve a radical reconceptualization of the criteria for distributing such positions (as outlined below), or a belief that all individuals have an equal right to decision-making power in society. Such a belief is not as much an affirmation of group difference as it is an ultra-democratic view that positions of influence in society should be randomly distributed (or distributed by some other undescribed democratic procedure).

Young points out that the liberal conception of affirmative action redressing imperfections in meritocratic procedures of "worthy" selection only creates continual resentment against affirmative action seemingly end-running these criteria. (She never explains why she appears to reject a better traditional defense of affirmative action -- that its broader selection criteria -- overcoming of adversity, willingness to serve underrepresented populations, the imprecision -- but not complete arbitrariness -- of standardized selection procedures -- more fairly identity those who will perform the task well.) Rather, she argues that "objective, neutral" criteria for distribution of office are as class and culturally biased as any other versions of liberal "neutrality". This may well be true, but Young fails to make any explicit arguments as to what alternative criteria of selection (other than the problematic, sole criteria of group representation) should be followed for positions for which there is an oversupply of applicants. She does begrudgingly admit that even in a democratic division of labor there would be a role for experts. But assuming that there is only a limited need for (a socially constructed and difficult to measure) expertise in the professions,

Young does not advance any alternative criteria for selection -- such as possessing the cultural and emotional sensitivity to perform well or being likely and willing to serve in underserved areas. That is, unless access to limited apprenticeships, uniform services, civil service and professional jobs is to be simply a result of a political powerplay (likely to be lost by the marginalized in the long run), then there has to be an operative majority in favor of certain criteria of selection which are deemed to be fair (though they by no means need to be standardized test scores). Though Young never advances any compelling alternatives to admittedly ideological conceptions of technical merit for her distribution of positions of professional and technical positions, she seems to implicitly agree with Michael Walzer's argument (see "In Defense of Equality") that as long as these positions convey inordinate access to privileges and wealth which are not intrinsic to their tasks, these positions should be open to people from diverse communities (particularly the disempowered since historically the "criteria" for these jobs have been biased towards the attributes of privileged communities). But Walzer implies that in the best of possible worlds, position involving scarce skills or surplus applicants would neither confer improper power or prestige upon their holders nor go to people who do not possess the socially-agreed upon criteria for access.

Young's discussion of affirmative action avoids two additional pressing problems that once again raise the specter of universalism. First, what are the agreed upon criteria for defining an excluded group? Wouldn't there need to be a universal social conceptions of fairness which when violated over time against an identifiable class of individuals qualifies as discrimination? And secondly, what constitutes an unjustly excluded group? Why shouldn't such opportunities be distributed randomly -- why should special preference be given to members of oppressed groups rather than to those who simply weren't chosen in the prior round of selection? Obviously, Young would either have to opt for an abolition of leadership or professional positions or for establishing a societal consensus as to what criteria merit such jobs and educational opportunities. And such criteria -- even if they be those of election or group representation -- need to be applied in some fair manner if a democratic community is to consider them to be just. Young mentions Jews in her extensive listing of oppressed groups, but does not appear to include white working class, ethnic (predominantly Catholic) Americans who have been excluded from the professions to a much greater degree than Jews (and also more than Asians from middle-class backgroundss; the class, national and ethnic diversity of Asian-Americans is grossly simplified by "essentialized" notions of "model minorities." There is a radical difference between the life opportunities open to a Filipino farm worker and his/her children or a recent Chinese immigrant working in an Amnerican sweatshop as compared to children of certain second or third generation Asian-American professionals.) Perhaps Young believes class background should be a major criteria for affirmative action (a position with which I would concur). But it hardly merits a mention in the book. (And would we want to get into a "comparative oppression analysis" as to which groups most merit consideration).

Totally divorcing the distribution of professional and technical positions from any agreed upon criteria of desert and judgments of past discrimination , and distributing these positions according to group claims of exclusion, is bound to set off competing claims of group oppression. This is not some neo-conservative pipedream, as Young implies, but a reality to which anyone who teaches white working class students can attest. Unless such students concur that the historic legacy of slavery and Jim Crow, combined with current discrimination, creates more severe barriers to African-American achievement than the barriers of class inequality it is likely that affirmative action will continue to be a wedge issue for Republicans. Not that one can't make a cogent argument that race is a more profound discriminatory barrier than gender or class. But it certainly helps anyone defending affirmative action among the white working class to contend that

while race is a valid criteria for affirmative action so should (perhaps to a lesser degree) class.

Young argues that affirmative action can only be strongly defended based on a citizenry's commitment not to some ephemeral conception of liberal meritocracy, but to a democratic division of labor. A community that is committed to eroding the division of labor between task-definition and task-execution will want to insure broad access to the more prestigious task defining professions (while also working to eliminate the hierarchical professionalization of most task-defining jobs). Only a community's commitment to democratic distribution of power, she implies, can sustain support for affirmative action and special political representation for historically excluded communities. While this radical democratic critique of meritocracy and the division of labor may be compelling to those committed to participatory democracy, such a shared commitment obviously necessitates a much greater commitment to shared identity and cultural values than does Young's idealization of the diverse, ethnic city. Her city of diversity, even in its best realization, is characterized by a politics of ethnic mobilization which may achieve a roughly just distribution of economic goods, but never yields a city-wide shared commitment to social justice.

In short, for Young's "different" communities to share a commitment to redistribution of social, political and economic power there will have to be stronger bonds of common values and experience across "different" communities than those of "strangers." The same is true for her argument that while local communities should have some control over administration of social goods, only regional metropolitan governments can insure the type of economic equity which would guarantee equal empowerment. Again, it is precisely a universalist commitment to social justice which would motivate suburbanites to share their tax levies with residents of the inner city. Such redistributive policies are not an affirmation of the politics of difference, but of a strong social solidarity (particularly if we are proposing class and racial integration of neighborhoods, workplaces and schools). How we move from a situation where the polity is a supracommunity of strangers drawn from different communities to a radical democratic pluralism where diverse communities also share a sufficiently strong sense of cross-communal civic solidarity to sustain a shared democratic citizenship is the issue to which this essay now turns.

#7. Towards a Politics of Democratic Difference and Democratic Solidarity

In a radical democratic society where institutional structures were constructed through participation open equally to all there would remain differences in democratic authority and power. That is, the decisions of a democratic decision-making process confer distinct social roles upon individuals. Such roles would be less permanently fixed in a society which consciously strove to transform the course of the working life and the division between work and leisure through sabbaticals, flex-time, and a reconceptualization of the working life and child-rearing. This democratic construction of social roles within public institutions would differ in two fundamental ways from the process of public decision-making under democratic capitalist pluralism. Within such societies the inequalities of power within allegedly voluntary institutions in civil society permeates the political arena. To paraphrase Michael Walzer, the sphere of money penetrates the sphere of liberal democratic politics whose practices are supposedly determined by persuasive argument among equals, not persuasive advertisements by those able to purchase the means of communication. In addition, liberal pluralism restricts the sphere of democratic deliberation to the formal institutions of representative democracy. By ideologically claiming that all economic relationships are voluntary exchanges in the market, democratic capitalism refuses to

admit what its own economic theory has had to confess -- firms are organized in hierarchial manners because authority is a more efficient manner of organizing production than is an iterative process of constant bargaining among individuals. But if firms are systems of authority where decisions are binding upon their members, then why shouldn't the structure of authority be subject to democratic deliberation? Such a practice need not mean that all share in management or that the role for experts or technicians be eliminated. But, as with the concept of "civil service", this division of labor would be subject to the democratic control of the members of the firm.

While participatory democratic theorists have written extensively on issues of workplace democracy, they have had less to say concretely as to issues of democratizing education, cultural life and sexuality. Despite the implications of the slogan "the personal is political", there has been a paucity of theorizing about the role of democratic politics within social relations of child rearing, companionship and sexuality. The predominant meaning of the slogan "the personal is the political" implies that human relations deemed to be most "personal" are actually socially constructed by economic, cultural and ideological practices that are shaped by political power. But affirming that public educational and cultural institutions should promote a vision of egalitarian rather than oppressive sexual relations does not necessarily mean that the community as a whole should intervene in particular sexual and childrearing relationships. A polity might choose to shape parenting attitudes by supporting high quality institutionalized daycare, childrearing by gay and lesbian couples, paid paternity and maternity leave (with incentives to insure that men use this leave as much as women). Obviously, the community may democratically decide to enforce certain rights for children and partners (e.g., against battering or corporeal punishment). But should it regulate the specific moral and cultural practices of those who are guardians of children? (When public schools act in locus parentis our democratic instincts are less shocked by talk of public imparting of values -- though usually pluralist democrats settle on the preeminence of imparting the value of thinking critically -- that is the dominant public ideology be self-reflexive). But what of those more "voluntaristic" institutions that are likely to remain the predominant mode of meaningful human activity (e.g., friendship, romantic love, sharing of avocational pursuits). And when can the universal norms of a democratic community prohibit the practices of undemocratic, but voluntary institutions? Let me raise a quandary about which I have mixed intuitions: should a radical democracy ban (or penalize by taking away tax exemptions, etc.) the practices of a voluntary religious association which is sexist and hierarchical (e.g., the institutional Catholic Church and much of orthodox Islam and orthodox Judaism)?

The probability is that a radical democratic pluralist society which reconceptualized the boundary between the personal and the political (the private and the public) might well still opt for preserving a sphere of social relations relatively free from political regulation by the entire community. But an unreflective endorsement of a politics of difference can in some ways reproduce the problems of liberal pluralism. If what sustains individual identity is rootedness in a particular ethnic, racial or sexual community then what common bonds and values exist to mediate conflict within and among those communities? And will sufficient social solidarity exist to sustain the equitable distribution of public resources which make the equal worth of liberty possible? An uncritical endorsement of "difference" eschews a fundamental challenge: what common moral values and social practices will glue together these distinct communities? And without such a "universal" commitment to shared citizenship and democratic practices might not "particular" communities pressure their members to take on an essentialized, homogenized identity in order to affirm their group claims? Nor does an affirmation of "difference" provide any norms for evaluating the practices of specific communities. Why might we argue that a racist or homophobic community is any less valid an expression of "difference" than the practices of a feminist or African-American organization. Obviously, the intuitive move is to assert that the first form of

"community" represses human individuality, while the second forms of "community" empower groups of people whose individuality has historically been suppressed. But over time would the identities formed out of (hopefully receding) oppression be altered? Thus, a commitment to diversity within a shared national or international polity, moves the pluralist democrat to defend universal values of tolerance if a war of all against all is to be precluded (Ironically, Julia Kristeva, a prominent post-modern critic of the oppressive nature of universalist conceptions of the self, has written a political pamphlet arguing that only tolerance -- a universal, liberal value -- can stop the virulent ethnic particularism engulfing Europe). Arguing that non-oppressive, particular expressions of national or ethnic or gendered communities should be sustained in a pluralist democracy is to proffer a universal political principle (liberty and non-coercive discourse) to defend a supposedly radically "pluralistic" vision. Perhaps this is why when we talk of a democratic pluralism we take the demos to consist of citizens who possess both specific identities (plural identities) and the shared sense of belonging to a common, but pluralistic demos.

#8. Teleological versus Anti-Foundationalist Conceptions of Politics

In these final three sections, I wish to examine another alternative to universalist and neo-Kantian conceptions of social justice. While there is only a loose elective affinity between post-modernism and pragmatism, I wish to show how the emancipatory and critical potential of both outlooks suffers from their unwillingness to embrace quasi-universalist conceptions of human rights and equality. Defenders of an anti-foundational, pragmatist conception of politics argue that the conception of a final end to history integral to teleological conceptions of human development is hostile to the openess of political freedom. Undoubtedly, the anti-political streak in the Kantian and Hegelian traditions derives, in part, from the view that human freedom will be instantiated in some final form -- whether it be the kingdom of ends, the universal reason of the rational state, or the self-determination of the working class. The search for an end to heteronomy and conflict served as an ideological justification for repression in supposedly Marxist regimes. If the emancipation of the proletariat was embodied in the rule of the vanguard party then any opponent of that regime was de facto an opponent of true freedom.

But it is glib to assert that teleological conceptions of morality are inherently anti-political whereas pragmatist, anti-foundational conceptions are inherently open and political. All conceptions of politics advance an implicit or explicit vision of what social order would be in accord with human potentiality (conservatives contend that traditional forms of behavior constitute the possible, whereas radicals contend that resistance to traditional hierarchy indicates a potential for greater freedom within human social arrangements). That is, even if pragmatists abjure an argument-ending, definitive proof "which goes all the way down" for their political beliefs, democratic pragmatists must believe that their convictions are in accord with what is desirable for their own defined community. And would they not contend for these values in any other community that might be somewhat culturally receptive to them?

Now the pragmatist might contend that they only engage in an immanent critique of their societies. Any criticism they make of an injustice within their society is grounded in a conception of justice implicit (or explicit) within their culture. That is, cultures consist of contradictory practices and hypocritical behavior. But why take one side of the conflict or condemn the behavior as violating the true values of the society? Implicit in any critique of a given social order is the belief that those practices criticized are less morally desirable than the status quo. That is, implicit to even the pragmatist choice is a belief that reasoned judgment can inform us as to which social

practice is more just.

The anti-foundationalist will claim that there is no ultimately just social arrangement; what is just is simply those practices conceived to be just by a community which shares cultural and discursive practices. But democratic anti-foundationalists, such as Michael Walzer, implicitly believe that only democratic communities can be judged to be freely self-constituting. His criteria for membership (the contribution of labor), his definition of political power as justly deriving from the voluntary consent of the governed, and his contention that in a just community money will not influence politics, all indicate that (contrary to his critics and sometimes his own view that justice is societally-relative) the only just community of plural goods and equal membership is a democratic community.

Walzer makes an empirical claim that moral values cannot be imposed from above or from without. There is no Archimedian point or external viewpoint from which observers can engage in effective social criticism. But that anthropological and historical observation often is conflated by Walzer's critics (and, it must be admitted, by Walzer himself at times) to argue in a Rortyian pragmatist manner that justice is simply equivalent to a society's definition of justice. But if that be the case then why does Walzer reject the majoritarian position in Germany and the United States that guest workers or undocumented workers should not have the full rights of citizens? Walzer's argument that those who contribute to the well-being of a society have the right to a political voice in that society is not a morally relativist argument, but rather a statement of universal democratic values. These values are undoubtedly a part of American culture; but a contested -- and, at the moment, minoritarian -- part. Thus, Benhabib is correct to argue that, at his best, Walzer's project is one of critical, normative hermeneutics rather than a strictly pragmatist explication of uncontested, shared beliefs.

Even if it be a truism of the sociology of knowledge that new ideas must already be somewhere present in a given culture, this truism does not deny the reality that practices of moral judgment and intellectual choice are inherent to even the most immanent of social critiques. And such a critique would not be engaged in unless the author believed that the new practices would promote greater freedom than the current practices. That is, the democratic pragmatist is a greater believer in Enlightenment conceptions of emancipation and critique than he or she cares to admit. Implicit in their own participation in democratic critique is a belief in the moral preferability of democratic life to authoritarian alternatives (and the serious imperfections of formally democratic regimes). Given the fragility and imperfections of nascent and "mature" democracies across the globe, the end of history and ideology is neither an option for democratic pragmatists or a democratic teleologist.

#9. How Anti-Foundational can the Philosophical Grounding of Democratic Politics Be?

Richard Rorty and Benjamin Barber both contend that an anti-foundationalist epistemology must underpin the political psychology of democratic societies. But is this nothing more than an "anti-foundational" foundationalist orthodoxy? Barber contends that democratic politics can only exist if society recognizes there is no one scientific or correct answer to a social choice. That is, democracy involves a polity deliberating upon and deciding questions of public policy that have no one correct answer. If they did have technical or scientific answers there would be no need for democratic deliberation -- an impartial observer (the Rawlsian deliberator of one) could make the correct decision for the entire polity. Barber does not take an explicitly relativist position. In his

political universe, there might be a role for scientific certitude in regards to the physical sciences or technology. But democratic politics must be the realm of uncertainty -- the only 'correct' decision is that made through democratic deliberation. And that decision can always be revisited, revised or overturned by the democratic process.

Rorty makes a much broader epistemological claim. For Rorty, the democratic temperament involves a recognition that all truths are relative to the shared meanings of a given cultural community. Democracy -- or any other human moral value -- cannot be conceived in universal terms (whereas Barber implies that the only free societies are democratic ones). In fact, the belief that there are transcendent or cross-cultural values that instantiate what it is to be truly human encourages the hubris of political vanguards which use their certitude as to "true human interests" to impose their particular conception of the good on others. Rorty is more the liberal pluralist than he is the democrat. What he really is interested in is the pursuit of private aesthetic concerns; the solidarity of the democratic community does not extend beyond the cultivation of a tolerant atmosphere that will allow the flowering of these private pursuits.

Of course, those skeptical of Rorty's skepticism might ask: why prefer one's own liberal democratic culture to a monolithic, authoritarian culture? Is it just the accident of being born into a community that values pluralism -- or is a liberal democratic community a freer society for any and all individuals fortunate enough to live within it? That is, why does Rorty value the values he holds -- is he purely a liberal democratic pragmatist by accident of birth?

Barber is more honest about his convictions. He contends that democratic societies best develop the human potential for collective deliberation and defends the democratic conception that in situations of social interdependence the only freedom possible is that of a democratic self-legislating community. Barber offers a (partially true) scarecrow caricature of liberalism as a society maximizing the pursuit of fortuitous (i.e., non-deliberatively formed) individual preferences. His dismissal of liberal rights as inherently atomizing reads dangerously like a standard Marxian dismissal of bourgeois rights as solely a defense of acquisitive individualism. Nevertheless, when challenged Barber admits (particularly in an American Prospect article) that political and civil rights are integral to the democratic commitment to the equal worth of each voice. So to Barber we might ask: does not a democratic polity reject an epistemological agnosticism in regards to one basic political question -- the value of democracy and of those rights necessary to guarantee the preservation of democracy? Should democratic polities have a right to constitutionally or culturally discourage (or ban) decisions that violate the principles of democracy itself? What of laws banning explicitly racist and undemocratic parties or of juridically overturning majoritarian votes in favor of dictatorship. (These are issues that civil libertarian Americans may easily decide -- but questions about which German democrats have radically different intuitions.) That is, while on specific policy questions a democratic politics needs to be agnostic and reject scientistic conceptions of political truth, is not a viable and sustainable democracy dependent upon a moral consensus as to the value of the democratic process itself?

Social democrats would argue that a strong democracy necessitates that the resources necessary for citizen education (and keeping together of basic body and soul) be equitably distributed. Or are the full conditions for democratic discourse --the freedom from economic necessity that provides time for deliberation and study -- to be limited to the tenured professoriat? (Here Barber's commitment to the economic basis for democracy seems ambivalent, at times taking an Arendtian approach to the social or economic policy debate as a debasement of free democratic discourse). It is curious how in the 1980s many strong democrats and communitarians wished to eschew traditional left/right ideological concerns as anachronistically "economistic"

(citizen virtue being the key concern) at the very moment that the limited gains of social democracy were being attacked, programs which expanded active membership in the polity beyond the middle class. Commenting upon an argument that Sheldon Wolin made in a seminar that the welfare/warfare state served to demobilize political participation by transforming citizens into consumers (a partial truth, which is profoundly wrong if taken as the total truth), Carole Pateman pointed out that the welfare (and thankfully in Australia not much of a warfare) state enabled someone from her working class background to become a university professor and participate in the academic critique of the welfare state as a barrier to democracy.

#10. Can the Defense of Democracy be Value Neutral?

A peculiar aspect to Barber's defense of an epistemologically "open" strong democracy is his implicit criticism of liberalism for being indifferent or relativist in regards to the comparative value of public versus private life. Echoing the critique of liberalism made by radical democrats such as C.B. Macpherson and Robert Paul Wolff, Barber implies that treating all human desires as equally valid denies the unique value of public communal deliberation. Liberalism has been traditionally criticized from both Aristotleian right and left (Straussian and communitarian) for being incapable of defending the value of liberal principles itself. That is, if liberalism is value-neutral, how can it defend its own worth against anti-liberal conceptions of the good society? William Galston, Charles Larmore and others have attempted to demonstrate that liberalism is not amoral; rather, liberalism advocates a way of life which promotes reasoned deliberation, public education, and the cultivation of the human faculties.

Just as principled liberals must elucidate the value of liberalism, principled radical democratic pluralists need to advance a moral defense of democracy. While democratic regimes may be agnostic as to specific public policy outcomes resulting from free and informed deliberation, they cannot be indifferent in regards to those social conditions which promote the very possibility of informed deliberation. Whether defended by foundationalist appeals to human potentiality or defended by culturally specific, historicized claims about the human benefits which result from free and open deliberation, democrats cannot be morally agnostic as to the value of democracy itself. That is, an ideal worth advocating is an ideal worth defending as a good, either for its consequences or as a good-in-itself. Beginning with John Stuart Mill, arguments for democracy have both cited the consequentialist benefits (human progress, informed policy, economic advancement) and the good-in-itself of a system of deliberation which respects the equal moral worth of individuals. Thus, in response to both anti-foundationalist pragmatists and post-modern advocates of a "politics of difference" who rest their defense of democracy on an epistemological -- and perhaps moral -- skepticism, democratic theorists skeptical of skepticism's ability to defend a democratic regime might retort: why is democracy better than any other regime?

UNDERSTANDING GENDER INEQUALITY:
THE RELATIVE INFLUENCE OF INSTITUTIONAL POWER AND GENDER CONSCIOUSNESS

Abstract

Game theorists and some feminist scholars would predict that individuals with asymmetric access to institutional power (such as an exit opportunity) should claim more resources than those without such access--regardless of the sex of the individual. Other feminist scholars, in contrast, emphasize the ways in which socialization and other mechanisms can produce gender-role internalization such that men and women of equal power behave differently. Based on this latter research, we would predict interactions between sex and institutional power.

To sort out these different arguments, we propose an experimental study of two-person prisoners' dilemma (PD) games in which an asymmetric exit opportunity is crossed with sex-of-subject. In some conditions, only men will have the exit opportunity while in others only women will have the exit opportunity. (We also plan same-sex conditions.) The sex of an individual's body, however, does not necessarily match the "sex" of his or her psyche (Bem, 1993). Thus, in order to understand individual differences among women (and among men) we will correlate behavior with measures of gender-role internalization (i.e., the "sex" of one's psyche) and "gender consciousness," i.e., beliefs about proper gender roles (Tolleson Rinehart, 1992).

The results of this study have implications for the broader policy question of how to lessen gender inequality. Can gender inequality be corrected by changing the balance of institutional power (in this case access to an exit option)? Or, are changes in the socialization process also necessary before equal outcomes can be expected?

Understanding Gender Inequality: The Relative Influence of Institutional Power and Gender Consciousness

Investigating inequality has not been a major thrust of game-theoretic research.[1] In this project, we begin to redress this significant oversight by focusing on differential institutional power and its relationship to a specific demographic characteristic that has historically been associated with inequality--gender. There are two general aspects of power relevant to the analysis of gender in a game-theoretic structure--the power to determine the structure of the game (i.e., institutional and political rules) or what Lipman-Blumen (1984) terms "macromanipulation" and the power of choice within a particular game, what she terms "micromanipulation." Crudely expressed, men hold most of the macropower within society and thereby limit women's power to the choices they can make within particular macro-determined structures from the work place to the family. According to this approach, then, gender inequality has an institutional basis and the comparison of different distributions of institutional power (symmetric and asymmetric exit options within a PD) can shed light on the behavior of the sexes in positions of comparable and unequal institutional power.

Many feminist scholars suggest that gender inequality goes beyond structural power differences to reflect basic behavioral differences between men and women that result from socialization patterns. From this perspective, the extent to which socialized gender differences produce gender inequality depends on the degree of gender-role internalization and on gender consciousness. Therefore, changes in the institutional power mix will be insufficient to fully correct gender inequality. Moreover, simply noting sex-of-subject may be inadequate for measuring gender differences in a game-theoretic structure.

We propose an experimental design that crosses institutional power asymmetries with sex-of-subject where sex-of-subject is correlated with measures of gender-role internalization and gender consciousness. Through this experimental analysis, we hope to contribute not only to a game-theoretic understanding of gender inequality but also to feminist scholarship. We believe that the tools of game theory can help us to understand both the macrogame responsible for gender inequality and the power available to women in particular microgames. Moreover, an experimental, game-theoretic approach can help to disentangle the complex set of factors that produce gender inequality, thus leading to the development of more successful policy approaches for correcting such inequalities.

The literature relevant to sex, gender, and power is extensive--though the experimental, PD research on gender is much more limited. In what follows we briefly review these literatures. Then we offer an experimental "analogue" (or institutional power structure) and give a game-theoretic analysis of how subjects ought to behave in that analogue. A detailed discussion of the design, subject populations, and experimental procedures follows.

Theoretical Background

Reflecting on a psychological, largely experimental body of research, Deaux and Major (1987) describe a troubling anomaly of gender research:

> Those who predict stable sex differences have had trouble accounting for the often limited ability of sex to predict behavior, and for a variability that sometimes appears random. Those who argue that there are no stable sex differences, on the

> other hand, have had difficulty explaining widespread male-female differences in the culture at large (Deaux and Major, 1987, p. 369).

This anomaly has been reproduced in the experimental literature that investigates the relationship between gender and PD behavior. Specifically, stable sex differences in behavior have not been found. Sometimes men cooperate more than women (e.g., Rappoport and Chammah, 1965; Kahn, Hottes, and Davis, 1971; Brown-Kruse and Hummel, 1990; Sell and Wilson, 1991); sometimes women cooperate more than men (e.g., Aranoff and Tedeschi, 1968; Jones, Steele, Gahagan, and Tedeschi, 1968; Meux, 1973; Stockard, van de Kragt, and Dodge, 1988); and sometimes no difference is found (e.g, Caldwell, 1976; Goehring and Kahan, 1976; Dawes, McTavish and Shaklee, 1977; Javine, 1986; Orbell, Dawes, Schwartz-Shea, and Elvin, 1993).

This apparently inconsistent pattern of results may be a function of complex interactions between sex-of-subject, behavior, and other variables. In two recent studies, for example, expectations played a crucial role. Kerr and MacCoun (1985) found that when subjects knew their partner was a man, both males and females were less cooperative. Orbell, Dawes, Schwartz-Shea, and Elvin (1993) found that subjects generally expected women to cooperate more than men but this general expectation did not translate into behavioral differences. Sex-of-subject may also interact with experimental parameters such as sex of the experimenter, sex composition of the group, and other experimental procedures and manipulations. For example, Sell and Wilson (1991) found that women contributed less than men when interaction was via computers rather than face-to-face and Sell, Griffith, and Wilson (forthcoming) found sex effects only when subjects were paid with a resource other than money.

Disentangling second and even third-order interactions is difficult, but a variety of clues regarding essential factors may be found in the extensive feminist and gender literature. For purposes of analysis, we divide the feminist and gender scholarship into two approaches--those that emphasize institutional structures as the basis of gender differences and those that emphasize socialization. Though dichotomizing the literature in this way serves the purpose of characterizing a complex, diverse literature in a concise way, we wish to emphasize that authors in both categories recognize the importance of both structural and social-psychological barriers to women's equality. Thus, classifying particular authors may be problematic.[2]

The theorists who emphasize the structural or institutional bases of women's inequality[3] argue that women's behavior can best be understood as being constrained by their situations. As Bem expresses it,

> The psychological implication of [this] perspective should be clear: change a woman's position in the social structure and her motivation and ability will quickly change as well. ...what needs to change is not the psyche--or even the socialization--of the individual; what needs to change is the androcentric social structure that operates systematically and in the here and now to preserve male power (1993, p. 135, emphasis added).

This position is completely consistent with the game-theoretic literature that suggests that institutions matter and that access to institutional position is a relevant factor in explaining power asymmetries. (See Shepsle, 1979; Ostrom 1986.) If men have been favored, it is because they have had access to greater institutional control than have women. The policy prescription is equally clear--change the institutional power mix to provide greater access for women and you will change the mix of outcomes as well. Thus, a structural approach

places the emphasis on the institutional rules rather than on any difference between men and women. Faced with the same institutional incentives, men and women can be expected to react exactly the same on average.

In contrast, the second group of theorists[4]--while acknowledging the importance of structural/institutional power--emphasizes the tenacity of enculturation. Years of socialization as children as well as cultural messages (Coward, 1985) and contemporary pressures on adults result in "role internalization" that is not easily cast off even in those cases where women and men have equal power.

The research on socialization and gender-role internalization challenges game-theoretic assumptions about the universality of the economic model of human behavior. For example, instead of being the "autonomous choosers" of game theory, women are viewed as "embedded" individuals (Hirschmann, 1989), embedded in a web of obligations to others.

The institutional and socialization approaches are both competing and complementary explanations of gender inequality. First, the "macrogame" is rigged because women have not historically participated in design of social institutions and as a result have had fewer options available to them (e.g., lack of the franchise, laws restricting divorce and labor force participation, etc). Second, as they confront those choices that are available to them in particular "microgames," they must cope with social expectations and internalized scripts about how women should behave. A careful experimental test in which sex-of-subject is crossed with institutional power should allow us to examine the independent effects of these explanations in a way that is virtually impossible in natural settings.

Exit as an institutional power resource

A prevalent theme in the game-theoretic literature over the last fifteen years is that institutions matter. (See, in particular, Plott and Levine, 1979; Shepsle, 1979; Denzau and MacKay, 1983; Ostrom, 1986; Shepsle, 1989; Ostrom, 1990). The presumption is that individuals with access to institutional power will use the rules in place to manipulate and change the expected social outcomes. We propose an extension of this analysis by focusing on a particular institutional power--the power to exit.

Although it has long been recognized that exit is a form of economic power as consumers exit from one firm in favor of another, Tiebout (1956) showed that exit is also a form of political power. He suggested that citizen mobility ("voting with one's feet") among competing local jurisdictions can result in an efficient allocation of resources to the local public sector. The theory of clubs (Buchanan, 1965) demonstrates how exit is a force against discrimination. Hirschman (1970) pointed out that "exit has been accorded an extraordinarily privileged position in American society" and suggested the following examples: pilgrims exited Europe and pioneers left the cities of the East; hippies in the sixties "turned on and dropped out;" many opposed to the Vietnam war went to Canada (1970, p. 106). Hippies and war avoiders combined their deviance and defiance in a way that exit became a form of political voice.

Exit as a power resource has not been modeled extensively in the PD literature. With the exceptions of Orbell, Schwartz-Shea and Simmons (1984), Orbell and Dawes (1991), and Vanberg and Congleton (1992), models of the PD have included only a binary choice between cooperate or defect, not the trinary choice that would include exit. In each of these analyses, the researchers found that exit changed the expected outcome of the game. Investigating the consequences of exit (using a one-shot, NPD, experimental

setting) Orbell, Schwartz-Shea, and Simmons (1984) found that the exit decision had the same moral implications for subjects as the cooperate/defect decision. Orbell and Dawes (1991) made a theoretical argument that the existence of an exit option across a series of two-person PD games produces a "cooperator's advantage" under select conditions. Vanberg and Congleton (1992) came to a similar conclusion using an evolutionary, simulation approach to exit decisions across a series of two-person PDs.

Though researchers recognize that exit costs often vary across individuals and situations, there has been no systematic, theoretical, much less empirical, research on this possibility. Instead, in the research reviewed above, conclusions are based on a model in which all decision makers are assumed to have equal access to an exit option. In this analysis, we propose to build on this literature to examine not only symmetric exit power but asymmetric distributions as well.

We propose to explore to what extent the effects of exit power are maintained or even expanded when it is possessed by only one player in the PD setting. To understand whether these institutional powers may be used differently by men and women, we consider how gender differences may interact with exit power to confound the simple institutional effects.

Socialized gender differences

Very briefly, socializing agents, particularly parents and teachers, train boys to be self-reliant and achievement oriented. They are taught that achievement is a function of direct action (Lipman-Blumen, 1983, pgs. 55-59). In contrast, girls are taught that achievement comes through relationships, in particular through relationships with a prominent male. Lipman-Blumen terms this "vicarious achievement" (1983, pgs. 59-64). To the extent that gender roles[5] are internalized, women are said to be more "expressive" whereas men are said to be more "instrumental." Some scholars also conclude that women value relationships more than men and men value competition more than women (Wilson, 1993, pgs. 23-4). Because gender roles are "diffuse" (i.e., influencing many aspects of a person's life), these differences imply significant gender differences in a wide variety of arenas.[6] Such differences obscure our ability to use a single model of the individual to explain outcomes in mixed-sex, experimental decision settings. If these gender roles are internalized, then we would expect women confronting similar choices to men to respond differently. This may be particularly important in negotiation settings where women and men interact strategically.[7]

When we examine gender-role internalization it becomes important to look beyond average performance to consider the range of possible socialized outcomes, i.e., individual differences in the degree of gender-role internalization. Within social psychology, early research focused on masculinity and femininity and it was implied that deviation from societal norms was "unhealthy." In the early 1970s, research by Spence and Helmreich (1978) and Bem (1974) revolutionized both the conceptual and the empirical approach to these concepts. Masculinity and femininity were no longer conceived of as bipolar opposites, but as personality traits which both sexes could incorporate into their identities to varying degrees.

Feminist scholars suggest that differences among women relate to the level of "consciousness" achieved by women. Though women (and men) may behave congruent with institutional power and social-psychological expectations on average, individual women throughout recorded history have recognized and, when feasible, objected to their status (cf., Lerner, 1993). Consciousness, then, is a quintessentially political concept, linking individual beliefs to action (or inaction) in the political sphere. Put another way,

consciousness implies the ability to question and even to change gender-role internalization. It also implies that the individual has preferences about how the "macrogame" should be organized--whether it be to change or preserve a particular society's gender roles.

Though use of the concept of consciousness is ubiquitous in feminist scholarship, empirical research has been much scarcer. Working with the American National Election Studies data, Gurin, Miller, and Gurin (1980), used particular questions to represent four theoretical dimensions of group consciousness: identification, discontent, withdrawal of legitimacy, and collective orientation. These researchers found notable group consciousness among ethnic and racial groups but comparatively little among women. (Additional work on feminist consciousness includes: Klein, 1984; Conover, 1988; Cook, 1989.)

Most recently, Tolleson Rinehart (1992) has taken a different theoretical approach; instead of trying to build from a general model that embraces all possible types of groups, she emphasizes the differences between ethnicity and gender; e.g., no Afro-Americans advocate a return to slavery whereas there are women who advocate a revitalization of traditional gender roles. Thus, she defines gender consciousness as "the recognition that one's relation to the political world is shaped in important ways by the physical fact of one's sex" (1992, p. 14), a definition that encompasses both feminists--who want to change gender relations fundamentally--and anti-feminists who want to preserve or return to a more traditional vision of gender relations. Such an approach is useful because it leaves space for legitimate disagreement over what ought to be the proper gender roles, a controversial topic even among feminists[8]--not to mention the contrast between feminists and anti-feminists.

Tolleson Rinehart's theoretical approach has produced quite different results from the earlier work. She finds that women's gender consciousness explains differences in women's policy preferences and political participation, differences often hidden in any simple contrast between men and women. And she argues that "given American's generally weak ideological constraint, gender consciousness may well rival or replace ideology as an underlying structure for political attitudes" (1992, 165).

One conclusion from this brief review of the socialization literature is that no researcher has directly investigated the relationship between personality correlates of gender socialization (i.e., femininity and masculinity) and the more political concept of gender consciousness.[9] We propose hypotheses to address this gap after specifying the experimental context and discussing the measures of these concepts in more detail.

The Experimental Analogue

Game theorists began testing their models in the laboratory decades ago, developing analogues to perfect markets, oligopolistic markets, the prisoners' dilemma, etc. The precise predictions generated by game theory (as well as its close attention to assumptions and parameters) make it well suited to experimental testing. For our purposes, game theory is also useful because, by definition, it focuses on individuals' choices in situations of interdependency. Despite this focus, Sapiro (1979) has observed that "the bulk of game and coalition literature displays little interest in [problems of inequality and oppression]" (p. 393).

Recently, however, Rose (1992) provided a loose game-theoretic explanation of gender inequality. Specifically, Rose connects the PD to a zero-sum bargaining game: If

two people must cooperate to obtain common benefits (the PD), how will the gains from cooperation be distributed between the two people (a zero-sum game)? Rose works through the implications of two possible assumptions: (1) women actually have a "taste" or "preference" for cooperation; (2) others simply believe that women have or should have this preference. If either of these assumptions holds, she argues, then women are at a bargaining disadvantage in the zero-sum game. They can still gain absolutely, but they gain less than men.

Rose's theoretical piece is intuitively compelling, but she does not develop a specific game-theoretic framework[10] and, as we show below, parameters and institutional structures are critical to assessing the micropower of women. The analysis proposed here begins to move us closer to a well-defined analytic structure that may be tested empirically. The game outlined in Table 1 attempts to capture the micro and macro aspects of power discussed by Lipman-Blumen and other feminists. In general terms, one macro aspect of male power involves having more alternatives; thus, the individual assuming the male role has three options -- cooperate, defect, and exit. The female player has only two options -- cooperate and defect. Thus, at the macro level the game is biased against the female player but at the micro level she retains some choice potential. We recognize that our selection of this particular rule configuration is somewhat arbitrary since any particular rule reflects only an example of the type of power asymmetries possible between men and women. However, we think that this is an appropriate starting place and results from this structural analysis should prove suggestive for a broader set of rule configurations.

The payoffs associated with defection by either or both players is set as in the standard PD. However, the specific distribution of payoffs associated with cooperation in this game depends on negotiations between the two players. (As in Rose's conceptualization, we propose a total payoff for cooperation of 4 that would be divided based on the outcome of a negotiation process). There are clearly joint gains from cooperation between the male and female players, but how those gains are to be distributed depends on how well each negotiates in the bargaining portion of the game. By allowing negotiation, we can evaluate to what extent the asymmetries in power between the players at the macro-level translate into asymmetries in their willingness to cooperate at the micro-level.

Game-theoretic analysis of the analogue

In this analysis, we retain the standard game-theoretic assumption that both males and females are rational, self-interested maximizers. As with the standard PD, this game has a dominant strategy when played as a single-shot game (defect, exit), resulting in the payoff (0,1) located in the bottom, right-hand cell. When played as an iterated game, cooperation can emerge as a dominant strategy if the probability of the players encountering each other in future rounds of play is high enough to offset the one-shot payoff obtained by defecting.[11] In this case, each player compares the expected, discounted payoff stream from cooperating against the payoff associated with defecting throughout. With a sufficiently high probability of continued play, a trigger strategy emerges in which each player cooperates as long as the other cooperates, but defects forever in response to the other player's use of the defect strategy. The income stream associated with continued cooperation exceeds the expected defection payoff as long as the discounted payoff from cooperation is greater than the immediate gain from defection followed by the discounted payoff from defection for all future rounds. In other words:

where c is the expected negotiated outcome from cooperation and d is the expected payoff if both players defect or exit.

This game presents an asymmetry in the risk the two players face in cooperating. Given the particular payoffs we consider here, the female player can expect an immediate gain of 5 from defection in the current round and then a return in each future round of 0 as the male player exercises his trigger strategy and "exits" from that point forward. Thus, the sum of discounted payoffs from future cooperative rounds must only exceed 5 in order for cooperation to be rational for the female player.

In contrast, the male player must forego the sure-thing payoff of 1 associated with exiting, in order to take advantage of the gains from cooperation and he risks the zero payoff of defection if the female player reneges. Thus, in order for cooperation to be rational, his expected gains must be greater than those required for cooperation by the player in the female role. This will be true whenever the male player has a higher expectation than the female that play will be repeated (he discounts the future less than the female player) or if his payoff from cooperation in every round is higher than the female player's payoff. If we assume that individuals perceive the probability of continued interaction equivalently, then we can incorporate this asymmetry in risk into the play of the game by allowing the players to negotiate the specific distribution of payoffs associated with a cooperative agreement.

At least two possibilities for how to play this game exist. (1) Players can negotiate a particular distribution of payoffs associated with cooperation and then proceed to make decisions regarding exit, cooperation, and defection. (2) Alternatively, players can decide a strategy regarding the PD and then negotiate the exact distribution for cooperative payoffs only if they select the cooperate, cooperate outcome. In this case, failure to agree on a given distribution after reaching the C,C cell results in a payoff of 0 to each player.

Under the first rules, any payoff distribution from (3,1) to (0,4) satisfies Nash equilibrium conditions, since a male player acting unilaterally can assure a payoff of only 1 and a female player can guarantee only 0 as her payoff. Under the second rules, male and female players face equivalent payoff scenarios since the male player no longer has the payoff option associated with exit. In this case any distribution from (0,4) to (4,0) is viable in a given stage. However, the male player's decision to play and cooperate rather than exit depends on his expectation of payoffs from this strategy. If he expected to receive a payoff less than 1 from cooperating, he would exit at the earlier juncture assuring himself of a payoff of 1. Moreover, with iterated play, he could enforce a distribution that grants him at least 1 by exercising his trigger if the female player refused to grant him at least 1 in the negotiation process.

For simplicity, we assume that the players negotiate a single distribution of payoffs associated with cooperation prior to play and that distribution holds for every stage in the iterated game. After negotiation, therefore, the game becomes a fixed PD without any potential for side-payments in future stages.

The particular distribution between (3,1) and (4,0) arrived at by the players depends on the rules of the bargaining process used in this preplay negotiation and the bargaining ability of each player, particularly his or her willingness to carry out a threat of defecting unless he/she receives the suggested amount. In this circumstance, each player will take the others' expectations regarding future payoffs into account to maximize personal payoff from the game. If the female player agrees to cooperate because of her

more limited options, then the negotiated payoff she would be willing to accept to forego defection should be lower than payoff the male player would require to continue play.

In this game, we might expect a payoff distribution of (1.5, 2.5) emerging as a way of equalizing the risk assumed by each player. If each player perceives at least a 70% chance that the game will be repeated, then the expected payoff from cooperating and receiving this distribution exceeds the payoff from defecting in the face of a threatened trigger strategy. At an egalitarian payoff distribution of (2,2) for the cooperative strategy, the male player will require at least an 80% chance of the game being repeated in order to make cooperation rational in the face of a threatened trigger strategy, while the female player requires only a 60% chance of repeat play. Thus, cooperation for the male player in this game requires a higher expected future payoff than the same strategy requires from the female player. All other things equal, the female player faced with fewer choices than the male will be more willing to cooperate in this iterated game setting.

Based on this theoretical structure and the literatures reviewed above we can derive a series of competing hypotheses. First, the null hypothesis is that neither sex of subject nor institutional power makes a difference in the decisions reached or the payoffs received. Hypotheses predicted by various literatures are shown graphically in Figures A through H. In Figure A we have represented average total earnings (from low to high) on the y-axis, sex-of-partner (female, male) on the x-axis, and power in the body of the graph (where power is defined in terms of the presence or absence of an exit alternative). Figure A represents the main effect hypothesis of game theorists and feminist, structural theorists, i.e., a main effect for institutional power and no sex-of-subject effects. In short, only power matters--with the caveat that we have operationalized structural or institutional power in quite a specific way.

Figures B and C show other possible main effects. In Figure B, the y-axis is the same (average total earnings from low to high), but the x-axis has been changed to contrast subjects with less and more power (again, where power is defined in terms of the absence or presence of an exit alternative). In the body of the graph, we represent average total earnings by sex-of-subject. In this case, we show a main effect for power and a main effect for sex-of-subject: the powerful earn more than the less powerful but men always earn more than women. Theoretically, such an outcome would provide strong support for the feminist scholars who argue for the tenacity of cultural expectations and socialization. Women--whatever their power position and no matter the sex of the interaction partner--are at a disadvantage in claiming resources.

In Figure C we have changed the graph labels yet again. In this case, we have represented average experimental earnings <u>of the powerful subjects</u> (from low to high) on the y-axis, sex-of-<u>less powerful partner</u> (female, male) on the x-axis, and earnings by sex-of-subject in the body of the graph. Assuming statistically non-significant differences between powerful males and females, this graph represents a main effect for the sex of the less powerful person. In other words, <u>both</u> powerful men and powerful women earn comparatively more when they play with a woman than with a man. Theoretically, this outcome is complex. On the one hand, it would support the feminist, structuralist argument that women are "oppressed" primarily because they lack power. But the differential treatment of men and women by women supports Lipman-Blumen's (1984) argument that women compete with other women for the attention of men. This outcome could also fit with Kanter's (1977) analysis of what happens to those few token women who gain power: they mimic men well and "sisterhood" be damned. As for powerful men's differential treatment of women, it would suggest a misogynist socialization.

Graphs D through H portray possible interactions using the same axis labels as in Figure C. In Figure D individuals compete with same-sex-partners in standard maximizing ways, but powerful women earn relatively less against male partners and powerful men earn relatively less against female partners. Theoretically, this pattern would be consistent with a crude sociobiological interpretation; i.e., both males and females are attempting to attract mates. Feminist scholars who emphasize the asymmetric nature of gender-role socialization (e.g., Lipman-Blumen, 1984) would not expect such "chivalrous" behavior from powerful males--though Wilson might if other societal institutions supported such behavior for males (1993, p. 10). Yet another interpretation is possible in the case of a powerful woman confronting a less powerful man; perhaps she is "placating" him based on her experience that less powerful men may be in that position only temporarily.

Figure E could be interpreted as the classic "war of the sexes" in which individuals with power attempt to "exploit" the opposite sex but are much less willing to act in a maximizing manner with a same-sex partner. Perhaps the powerful person is even "collaborating" with the less powerful partner, i.e., brotherhood or sisterhood. Such a pattern, if strong and systematic, would support an "ingroup/outgroup" interpretation of the relationship between the sexes. But this is not a pattern we would predict on the basis of gender scholarship (Tolleson Rinehart, 1992, p. 44).

Figure F possesses some theoretical similarities to Figure D. Unlike Figure D, powerful men behave in a maximizing manner regardless of the sex of their partner. But like Figure D powerful women confronting less powerful men earn relatively less than when they confront a less powerful woman. As discussed with Figure D, the crude sociobiological interpretation is that she may be attempting to win a mate. Or, again, perhaps she is "placating" him based on her experience that less powerful men may be in that position only temporarily. Still another possibility is that the man drives a harder bargain precisely because the individual in the powerful position is female. Such behavior could be interpreted solely in expectations terms, i.e., Rose's (1992) point that a general expectation that women are more cooperative than men lessens women's bargaining power. Or such behavior could be interpreted as Bem does, in Freudian psychological terms: "The risk of feeling emasculated--or neutered--is especially intense when a man has to acknowledge a woman who is more powerful or privileged (or even competent) than himself" (1993, p. 151).

Finally, Figures G and H represent two possible versions of the cultural feminist perspective on female behavior. By this interpretation females earn individually less regardless of the sex of their partner because they are not acting in an "exploitative" or "individually maximizing" way; instead, cultural feminists presume that women are naturally more nurturing, caring, and relationship-oriented than are men. Males, however, act either in a chivalrous or mate-attracting manner (Figure G) or in an misogynist manner (Figure H).

Figures A - H represent the logically possible experimental outcomes in "pure" form. Review of these possibilities is important because in popular discussions about gender relations, as well as the theoretical ones, people often are not clear about which pattern they see as predominant--even in a particular culture, historical time period, or situation. We do not necessarily expect, however, that the experimental outcome will be one of these clear extremes. First, there is the probable discrepancy between individuals' assigned power and status within the experiment and the power and status they bring with them to the laboratory. Indeed, that discrepancy is the basis for predicting interactions if one assumes, as does Sapiro (1979), that men and women carry their gender socialization into the laboratory. But, of course, our subjects bring other relevant experiences with them (e.g., based on other factors like class and race) and these factors may muddy the results.

For this reason we will gather additional demographic information in a questionnaire. A second key reason we would not expect to find so clear a pattern is that this representation assumes that the "sex" of the psyche (Bem, 1993) cleanly matches sex-of-subject. There is bound to be individual variation with respect to socialization and internalization of stereotypical gender roles, and gender consciousness on the part of women further complicates the possibilities.

Experimental Design

In the experimental analogue just described and analyzed above, we have modeled one aspect of gender inequality, a situation in which joint gains are possible but the distribution of those gains is a function of a macrosetting which--under the condition of prior negotiation--gives women less power a priori. A woman's share of the joint gains may equal or surpass that of the man but only if: (1) her bargaining ability exceeds his; (2) his perception that the game will be repeated is sufficiently greater than hers; and/or (3) he has an egalitarian ethos. These possibilities suggest that this analogue has face validity, that is, an overall "bias" against women but a bias that may not harm a particular woman depending on her own abilities and depending on the characteristics of the particular male she encounters.

The experimental analogue will most "mirror" the typical pattern in the social world when female subjects are placed in the role without an exit option and male subjects are placed in the role with an exit option. Of course, there are same sex pairings in the social world, in which women with more power interact with women with less power and men with more power interact with men with less power. And, occasionally, there are situations in which women with more power interact with men with less power. These three other situations can also be recreated in the laboratory but with the control that allows an equal incidence of cases across all four possibilities in order to test for the predicted interactions described above.

General design

The design crosses three factors: institutional structure (asymmetric versus symmetric exit), sex-of-subject pairings (male-male, female-female, male-female, and female-male), and gender salience (self-report measures administered before and after decision making). This produces 16 experimental conditions. But because only one different-sex pairing is necessary in the symmetric exit condition, that number reduces to 14 experimental conditions.

In all conditions, there will be two summary behavioral measures: (1) the negotiated distribution of the mutual cooperation payoff of 4; (2) total earnings from the repeated play after the negotiation. Other behavioral measures can be examined as well, including the bidding process and the pattern of cooperative, defecting, and exiting choices through the rounds.

Institutional structure will be varied by allowing either one (Table 1) or both subjects (Table 2) an exit option. In the asymmetric conditions, sex-of-powerful-subject will be counterbalanced with sex-of-less-powerful-subject to produce two same sex pairings (female-female and male-male) and two different-sex pairings (female with power/male with less power and male with power/female with less power). In the symmetric conditions, we will run the two same-sex pairings, but only one different-sex pairing because both subjects have the exit option.

As discussed above, a variety of other gender-related factors may confound this institutional relationship resulting in support of one of the hypotheses represented in

Figures B through H. Moreover, we might expect variation within each gender based on measures of gender-role internalization and/or gender consciousness. It is to measurement of these two concepts that we now turn.

Gender salience: Measures of gender-role internalization and gender consciousness

Deaux and Major (1987) have noted that it has been difficult to produce stable sex differences in the laboratory and that inconsistency has been replicated in the PD research on gender. Part of the problem may have been the failure of PD researchers, in particular, to measure the psychological correlates of sex-of-subject. But it may also be the case that gender is not always salient to subjects. Thus, we will combine these two concerns, directly manipulating gender salience by having subjects complete self-report measures and scales either before decision making (the salient condition) or after decision making (the non-salient condition). We will use the Bem Sex Role Inventory (BSRI) as a measure of gender-role internalization and the questions from the American National Election Studies used by Tolleson Rinehart (1992) to conduct her analysis of gender consciousness. The order of the two instruments will be counterbalanced in all conditions.

Bem Sex Role Inventory. The BSRI is the most widely used instrument for assessing "masculinity and femininity [and androgyny] in terms of the respondent's self-perceived possession of positive personality characteristics having sex-typed social desirability" (Lenney, 1991, p. 582). Lenney judges that the instrument has "excellent reliability" as well as validity that is "quite good" particularly when it is used in ways consistent with Bem's theoretical position. That position is summarized and developed in her 1993 book, in which she argues that her scale: (1) was developed to tap cultural--as opposed to biological--conceptions of masculinity and femininity; (2) treats masculinity and femininity as independent scales rather than bi-polar opposites; (3) contrasts traditionally "sex-typed" individuals with those who are androgynous.

American National Election Studies Questions. A questionnaire will be administered to all subjects. To be included are the questions used by Tolleson Rinehart in her analysis. Tolleson Rinehart conceives of gender consciousness as the intersection of two components: gender identification and gender role ideology. Tolleson Rinehart classifies responses to the gender identification question into two categories: "Individualists" are those women who did not identify themselves as "close" to the group, "women" in a list of some twenty possible groups. "Identified" are women who did identify themselves as "close" or "closest" For the 1988 National Election Survey Tolleson Rinehart reports 47.1% individualist and 53.9% egalitarian women (192, p. 54). Tolleson Rinehart also reports that "Men's 'gender identity' was exhaustively analyzed, and nothing systematic in it could be found; nor could it be found to explain anything about men's political behavior" (192, p. 54).

Tolleson Rinehart classifies responses to the gender role ideology question into three categories: women classified as "privatized" are those who--in a seven point Likert scale--responded that women's place is in the home (answers 5, 6, and 7); "ambiguous" answered 4 and "egalitarian" answered "equal role" (answers 1, 2, and 3). For 1988 the distribution across these categories was 15.2%, 15.5% and 69.3% respectively. Finally, she combines responses to these two questions to produce six-category measure of gender consciousness.[12]

The gender salience condition will test whether sex-of-subject effects only occur under conditions of salience. Some gender scholarship leads us to predict that salience will be necessary to obtain sex-of-subject effects (Deaux and Major, 1987) whereas other scholars find that quite subtle manipulations do produce effects (cf., Kerr and MacCoun,

1985). In addition, behavioral results will be correlated with the two self-report measures. Based on our reading of Bem (1993) and Tolleson Rinehart (1992) we predict:

(1) Identified women will "exploit" their female partners less than individualists. Privatized women will earn more in a position of power than egalitarian women.

(2) Androgynous individuals will interact in the way predicted by game heorists (represented in Figure A) whereas strongly-sex typed individuals will behave as in Figure B or Figure D.

(3) Strongly sex-typed individuals (as measured by the BSRI) will also be the privatized individualists (as measured by the Tolleson Rinehart questions).

Given these hypotheses and the use of self-report measures, subject pool selection becomes a matter of great significance.

Subject Population and Experimental Procedures

Beere reports that over sixty percent of gender role research uses college students as subjects (1990, p. 25). There are several disadvantages to the use of this particular subject population. First, to the extent that college attendance involves a self-selection process, this population is apt to have more liberal (or non-traditional) views of gender roles than the general population. Second, college men and women are likely to have quite similar attitudes, experiences, and expectations at this particular life stage. It is typically later, when decisions about marriage, career, and children must be made that gender roles (and gender role conflict) become more salient (Frieze, Sales, and Smith, 1991). Third, the climate on college campuses (what has been termed, "political correctness") may make self-report measures less useful than they once were; students know what answers "should" be given on issues of race, class, and gender.

To address some of these concerns we propose using two subject populations. Subjects will be recruited at two university campuses, Utah State University at Logan, Utah and Indiana University at Bloomington, Indiana.

The Utah site is useful precisely because its college population is not typical. Many, if not most, students are married and raising children so gender roles are salient. In addition, the student population at USU has over a seventy percent membership in the Church of the Latter Day Saints (LDS) or Mormon religion which stresses a traditional gender-role orientation. Thus, with regard to political correctness on issues of gender, we would expect this particular student population to be cross-pressured: students' traditional beliefs are being challenged by the college climate. The Utah subject population, then, will be useful because we expect greater variation on our measures than would be likely at another site.

The subject pool at Indiana University mirrors that of other colleges and is therefore prone to some of the disadvantages pointed out by Beere. But comparison with the Utah population will test the robustness of our findings. Moreover, the research on gender consciousness (as opposed to masculinity/femininity constructs of the BSRI) has been much more limited, so that replication with a college-age population will allow us to compare our findings to the research literature on the so-called "post feminist" generation of female college students (cf., Kennedy and Lenart , 1993).

Procedures

To preserve anonymity, eight individuals will be recruited to participate in a single session--though each subject will be playing with only one of the other seven subjects. Subjects will be told that they are "playing with one of the other [men] [women] in the room." This approach not only preserves anonymity but increases gender salience as well. Thus, even in those conditions where subjects answer the self-report measures after decision making (i.e., the non-salient conditions), there will still be this more subtle emphasis on gender.

Upon arrival at the laboratory, subjects will read and sign the informed consent forms. In the asymmetric-exit conditions, the eight subjects will take a ten-question general knowledge quiz in order to determine which subjects have "earned" the right to have the exit option. This quiz is necessary because Hoffman and Spitzer (1985) have shown that subjects will not view differential power as legitimate unless that power is earned. In other words, without this procedure subjects are not likely not to bargain effectively, but to simply split the mutual cooperation payoff of 4 equally. The quizzes will be pretested to assess any gender bias. In order to obtain the proper gender split across conditions, we will need to run experiments until the cells are filled.

The eight subjects will be seated at a desk with their identification letters. From this point on, their decisions will be recorded only in terms of these letters, the experimental condition, and experiment number. (In the gender-salient conditions, subjects will complete the self-report forms at this time.) Subjects will be presented with a payoff matrix (Table 1 or Table 2 according to the condition) and the consequences of subjects' choices will be explained using the matrix. Then, subjects' understanding of the matrix will be tested and the decision form will be explained.

For their first decision, subjects must negotiate the distribution of payoffs in the mutual cooperation cell. To negotiate subjects will submit written bids to the experimenter until agreement is reached. The experimenter will "pair" the bids correctly, but subjects will still not know with which other individual they are playing--though they will know the gender of that individual. Subjects will write the negotiated amounts on their matrices and then "play" will begin. After each round, subjects will be informed of the outcome and then play will continue depending on probability. For example, if play will continue with a 7/10 probability, the experimenter will draw from an urn containing seven black balls and three red balls. Play will continue until a red ball is drawn or time is up.

After making their decisions, subjects in the non-salient conditions will complete the self-report forms. When decision making and the forms are completed, subjects will then leave the experimental room one by one to go to the payoff room. At the payoff room each subject will be told the overall results of the experiment (i.e., the average outcome across the four pairs), will sign a receipt for the money, and will be paid.

Significance of Project

Investigation of inequality has not been a major thrust of game-theoretic research. In this project, we begin to redress this significant oversight by focusing on differential institutional power and its relationship to a specific demographic characteristic that has historically been associated with inequality--gender. We hope to contribute not only to a game-theoretic understanding of gender inequality, but also to feminist scholarship. We believe that the tools of game theory can help us to understand both the macrogame responsible for gender inequality and the power available to women in particular microgames.

The implications of such analyses for policy making is clear. If the game-theoretic hypotheses most closely reflect our empirical results then this would be strong support for concluding that changes in institutional power relationships in society--employment policies, marital laws, etc.--will be sufficient to produce the desired movement towards greater equality. But if the hypotheses that suggest interactive effects between gender and institutional power are supported, then a more complex mix of policies is warranted--a mix that recognizes the evolving nature of gender role socialization as well as the political debate over the desirability of traditional gender roles.

Endnotes

[1]Quite recently, rational choice sociologists have turned their attention to gender. See Heckathorn and Anthony, 1993 and Friedman and Diem, 1993.

[2] Ferguson (1984), for example, focuses on the ways in which power structures condition choice; those with less power are "feminized" and use "feminine" strategies of manipulation and flattery (i.e., a psychological aspect) as a "rational" response to their position of powerlessness. Yet we would still classify her as a structural or institutional theorist because she argues that the way in which powerlessness results in feminization is a general process which affects any body without power; e.g., bureaucrats (of either sex) are "feminized" by their subordinate position within hierarchy and therefore adapt strategies characteristic of dependent/powerless females.

[3]Scholars we place in this category include Epstein (1988), Eagly (1987), MacKinnon (1987), Ferguson (1984), Sapiro (1979), Kanter (1977), and Henley (1977).

[4]Theorists we classify as emphasizing the social-psychological aspects of gender inequality include Cott (1976), Chodorow (1978), Coward (1985), Fagot (1985), Pheterson (1986), and Whiting and Edwards (1988).

[5]In feminist sociology, the concept of "gender role" has been criticized. Unlike an occupation role, individuals cannot choose, nor take off, their gender. Instead, theorists like West and Zimmerman (1987) speaking of "doing gender," a concept which emphasizes the choices individuals make about how to display their gender to the social world. "Doing gender " is similar to the concept of "performativity" in the philosophical work of Butler (1990). Similarly, the "gender identity" produced via gender-role internalization has also been challenged because the concept(s) of identity/ self has changed significantly in both contemporary feminism and philosophy (c.f., Rosemblum and Turkle, 1989).

[6]There are dramatic differences in the degree to which different cultures and subcultures inculcate these gender norms in children, the degree to which deviance is tolerated, and the size of gender differences by culture and behavioral area (Hyde, 1990).

[7]Relevant literature on negotiation and gender includes: Kimmel, Pruit, Magenau, Konar-Goldband, and Carnevale, 1980; Stake, 1985; Wood 1987; King, Miles, and Kniska, 1991.

[8]There is vigorous debate over the desirability of traditional gender roles. Some feminists (cf., Sapiro, 1979; Pheterson, 1986) describe gender-role internalization as "internalized oppression" which implies self-hatred and self-doubt . In contrast, cultural feminists (cf., Gilligan, 1982; Donovan, 1985; Reuther, 1985; Tronto, 1987) argue that

characteristically "female behavior" has been devalued in our society though it offer a desirable alternative to stereotypically male behavior.

[9]Bem (1993), for example, argues that "gender polarization" (the socialization process that creates strongly sex-typed individuals) creates and sustains women's inequality. Moreover, those individuals who are "gender subversive" (i.e., gays and lesbians and androgynous heterosexuals) undermine gender polarization. But she does not directly address whether strongly sex-typed individuals can be feminists. Similarly, Tolleson Rinehart notes that "feminism challenges the notion that the primary allegiance should be to one's mate" (Tolleson Rinehart, 1992, p. 69). And she goes on to argue that "for heterosexual women to overcome the powerful ties of intimacy with men, especially when the whole culture has told them that these are the ties that matter most, is a quandary indeed" (1992, p. 70). But Tolleson Rinehart does not address how questions of sexuality (entwined, we would argue, with notions of femininity and masculinity) relate to the concept of gender consciousness.

[10]For example, sometimes Rose implies simultaneous negotiation over both the PD and zero-sum problems. Other times she implies a two-step process: that after the PD is solved, the benefits of the public good are distributed differently over men and women.

[11]This result, known as the folk theorem, allows a variety of ways in which a stream of future payoffs from iterated play shape the current choice. Kreps (1990), for example, suggests that players may use the average payoff across a series of stages, they may value the discounted sum of payoffs over the series of interactions, or they may value the expected value of a finite but indefinite series of interaction. Here, we will use the latter.

[12]In the 1988 survey, the 934 female respondents distributed themselves across the gender consciousness categories in the following manner: individualist/privatized--8.8%; identified/privatized--6.4%; individualist/ambivalent--8.2%; identified/ambivalent--7.3%; individualist/egalitarian--28.9%; identified/egalitarian--40.4%.

Covenant, Kingdom, Culture and Constitution
An Analysis of Comparative Influence

Covenant, Kingdom, Culture and Constitution
An Analysis of Comparative Influence

Introduction

Purpose

What was the influence of the Bible upon the writing and content of the Constitution of the United States? This question is most frequently posed in the homilies of the religious right in an attempt to identify the continuing efficacy of the American polity with adherence to fundamental Christian values. But it has also been asked more frequently in recent years within the rapidly growing academic context of the Religion and Politics Section of the American Political Science Association. This paper will not attempt a definitive answer to this continually contested question. In light of the growing body of literature directed towards its resolution, however, the present inquiry will present an analytical process that suggests a plausible solution.

The contents and findings of this paper may be summarized as follows. The question of the influence of the Bible on the Constitution is relevant and important. If the Constitution is found to contain concepts similar to those in the Bible, and if those concepts were probably derived from a knowledge of the Bible on the part of the authors of the Constitution, then it is reasonable to conclude that the Bible influenced the Constitution. The specific manner in which the Constitution may have been influenced, however, remains a matter of interpretation. Resolving difficulties of interpretation may best be achieved through a comparative analysis of the three central political concepts of the Bible: "covenant, "kingdom" and "culture." The Bible provides several forms or definitions of each of these three concepts. The purpose of this paper is to show that a preliminary application of this construct suggests that "Biblical" definitions of "covenant," "kingdom," and "culture" are not directly expressed in the Constitution. Does the Constitution, then, significantly ***contain*** these Biblical values? No. Does the Constitution provide for free expression, in society, of Biblical values? Yes.

It is important to note that this paper represents only an outline of the application of the analytical construct (covenant, kingdom and culture) to the problem at hand (the influence of the Bible upon the Constitution). Each of the major points requires further documentation not possible in this format. This presentation does summarize, however, the content and direction of the author's current research.

Relevance

The issue of the influence of the Bible upon the writing and content of the Constitution, as previously mentioned, is most frequently posed by the leaders of the religious right, who contend that the continued vitality of the United States depends upon its willingness to adhere to the commands of God; to be, in some sense at least, a "Christian" nation. The Christian Right has not been alone in raising this issue, however. In a presentation to the American Historical Association in 1954, H. Richard Niebuhr asked: "To what extent did religion and

specifically Christian convictions influence the development of American democracy; and, to what extent can that democracy be maintained here, or be reproduced elsewhere, without the aid of such convictions?" (Niebuhr 1954, 126). The continued vitality of American democracy is of concern, of course, not only to theologians such as Niebuhr, but to political scientists as well. In *American Political Theology: Historical Perspective and Theoretical Analysis*, Charles Dunn writes:

> In origin, was America a secular state as liberals contend or a Christian nation as conservatives argue? . . . Regardless of the position taken, the issue is exceedingly important. If America is a Christian nation as conservatives argue, then we have removed ourselves far from the theological and religious precedents of the Founding, and in the process, we have created a government decidedly contrary to the Founders' intentions. If, on the other hand, America is a secular state as liberals contend, perhaps undue deference has been given to religious issues and too much protection to religious causes (Dunn 1984, 11).

Dunn has raised an interesting question. As a continuing matter of public policy, should we adhere more to the Founders' religious values, or should we give the concerns of religious causes less attention? The question "Is America a Christian Nation?" is different, however, from the question "What was the influence of the Bible upon the writing and content of the Constitution?" The former question will be set aside in this discussion, in favor of the latter, which is important in itself for three primary reasons.

First, the question of the influence of the Bible on the Constitution is important to understanding the political phenomenon known as the "Christian Right" or the American "Religious Right." If Biblical principles motivate a political movement, then it is necessary to know something about those principles. Secondly, a thorough understanding of the Constitution is possible only through understanding the values and principles it expresses, regardless of the source. Determining the extent to which Biblical traditions, values or ideas are expressed in the Constitution is helpful in understanding the Constitution itself. As Reichley says in *Religion in American Public Life*:

> The political values on which the Republic was based are embodied in the Constitution, composed in 1787, and its subsequent Bill of Rights, enacted in 1791. This charter has provided a legal framework for relations between church and state, which, though altered by interpretation, remains in force to the present day. To understand what the Founders had in mind, it is necessary to examine in some detail the values and beliefs upon which they drew when they formulated the fundamental law. (Reichley 1985, 53).

Finally, in answering the question "What was the influence of the Bible upon the writing and content of the Constitution of the United States?" it is possible to more clearly define and compare contemporary political values and practices. To inquire what values are expressed by the Constitution does not necessarily imply that any particular set of values should be adopted today. It provides, however, a helpful reference point from which to examine our own

ideas, and to ask "From where have we, as a nation, come?" and "Where are we going?"

Analytical Construct

In asking what influence the Bible has had on the Constitution, one must first define, for analytical purposes the "Constitution." The Constitution of the United States of America is a social contract which defines the structure and powers of government and the values of the political culture that the government is established to enhance, defend and preserve. In this definition, "social contract" is conceived broadly to include arrangements, formed by consent of the effected parties, that set rules for social order. The three essential defining subjects of the Constitution are social contract, government structure and process, and political culture. In order to examine the influence of the Bible on the Constitution, therefore, it is necessary to examine the expressions of these three phenomena as they appear in the Bible. In the Bible, these terms occur, in a loose or general sense, as "covenant" (social contract), "kingdom" (government), and ethnos, translated most broadly as "culture" (for purposes of political science: "political culture").

In other words, if one is to examine the influence of the Bible on the Constitution, one will most profitably (1) examine the Bible's expressions of covenant, kingdom and culture, and then (2) compare the findings with the Constitution's expression of social contract, government and political culture.

This implies that other criteria for determining the influence of the Bible are less important. Probably the most common alternate criterion is the general pattern of religious beliefs of the Founding Fathers, *per se.* The argument is that the Constitution will necessarily reflect the overall pattern of religious beliefs of those who wrote it: if the Constitution was written by Christians, it is a Christian document. The weakness of this approach is the difficulty inherent in classifying personal belief-statements. Analysis of these belief patterns is subject to exceptionally wide interpretation. "Christian" may mean many different combinations of beliefs. John Eidsmoe, for example, dedicates his study *Christianity and the Constitution: The Faith of Our Founding Fathers* to demonstrating that the Founding Fathers were predominantly Christian. His detailed account of the expressed beliefs of thirteen colonial leaders leads him to conclude that eight of them were at least reasonably strongly committed Christians, three more were "probably" Christians, and two (Jefferson and Franklin) were probably not Christians (Eidsmoe 1987). Mark Noll, however, in *Religion and American Politics from the Colonial Period to the 1980's*, confirming the work of other researchers, comes to a different conclusion:

> The Federal Constitution was, in short, the eighteenth-century equivalent of a secular humanist text. The delegates were not a very orthodox group of men in any doctrinal sense. The only born-again Christian among them was probably Richard Basset of Delaware, a Methodist who generously supported the labors of Francis Asbury and other missionaries but who said nothing at the convention . . . Quite possible not a single delegate accepted Calvinist orthodoxy on original sin--that man is irretrievably corrupted and damned unless redeemed from outside (Noll 1990, 31).

Both writers make the same mistake: declaring the Founders to be either "Christian" or "Secular Humanists," and then labeling the Constitution a "Christian or a "Secular Humanist" document. This assumes that particular political actions taken by the Founders will have particular ideological results. Other values (not necessarily Christian), however, may also affect their actions. There is substantial evidence (Noll, 1990), that whether they were Christians or not, the Founding Fathers held two superior (with respect to the Constitution) values: political pragmatism and religious pluralism. Political pragmatism in this case means that their first purpose was to find a political compromise that would hold the confederation of colonies firmly together. This paper accepts Noll's evidence and conclusion concerning the "one-and only one-basic objective" of the framers of the Constitution, "determining their work in and after the Constitutional Convention . . . to frame a government that was adequate to make the infant nation of recently liberated states viable" (Noll 1990, 81).

Religious pluralism meant that those who were strongly religious as well as those who were not both believed, if for different reasons, in the absolute necessity of freedom of religion, and *national* governmental noninterference in religious practice. Those at the Convention who held strong religious convictions were convinced that religious faith could only be imparted to a population free to accept or reject it. Those less religiously disposed were even more convinced that the errors of religious thought could only be combated through free discussion. In practical terms, then, there was no controversy between the two groups on this point. It must be remembered, however, that the religious-ideological spectrum at the Convention was not as wide as it is in America today. Reichley confirms these conclusions:

> Two broad generalizations emerge on the principal founders' beliefs about religion. All were convinced of the need for religion as an underpinning for republican government . . . Though convinced of the need, both spiritual and political, for religion, most of the founders had at the same time concluded that government, at least at the national level, should be kept largely secular. (Reichley 1985, 105-106).

Reichley contends that this separation of church and state was derived directly from an awareness of the fundamental contemporary political reality of religious pluralism. Further, both Reichley and Noll confirm the argument that the evidence for the expression in the Constitution of both of these values--pragmatism and pluralism-- is clear and direct, whereas the evidence for other either "Christian" or "Secular Humanist" beliefs is implied or more difficult to establish.

Having shown the weakness of the major alternative approach to the question of the influence of the Bible upon the Constitution, this paper now turns directly to its purpose: to examine the concepts of covenant, kingdom, and culture in the Bible, and to seek evidence for them in the Constitution.

Covenant

The Bible contains numerous covenants. A review of their circumstances and content makes it possible to discern among them two distinct and separate types. The first may be called the *old* covenant, the series of agreements made by God with Abraham, Noah, David, Moses and others, addressed to the *temporal* political and social practices of the *community* of Israel. The second may be referred to as the *new* covenant, predicted (in the Christian tradition) by the eight century Hebrew prophets, announced by Christ's apostles, and addressed to the *spiritual* relationship with God of *individuals* within the community of believers.

The Old Testament (Community) Covenant

In *Federal Models of (Civil) Authority* (1991) Daniel Elazar provides a viable definition for the political science discussion of Biblical covenant:

> A covenant is a morally-informed agreement or pact based upon voluntary consent, established by mutual oaths or promises and witnessed by the relevant higher authority, between peoples or parties having independent, though not necessarily equal status, that provided for joint action or obligation to achieve defined ends (limited or comprehensive) under conditions of mutual respect which protect the individual integrities of all the parties to it (Elazar 1991, 242).

In an earlier article, Elazar demonstrated that the covenant is the central idea of the Jewish political tradition (Elazar 1983). It is political, but goes beyond politics in its moral and theological implications. It is a legally binding arrangement which "creates a partnership based upon a firm, legally defined relationship delineating the authority, power and integrity of all the partners . . ." Contrary to contemporary legal practice, however, in which a contract binds the parties exclusively to matters specified in the contract, a covenant requires the signatories "to go beyond the legal definition to fully realize the relationship" (Elazar 1983, 22). Elazar continues by stating that in its full theological meaning, "a covenant community is a community of souls . . ." He provides the example of the covenant between David and Jonathan as expressed in I Samuel 18 in which they "made a covenant in their love for each other (which was) like the love of each for his own soul." (Elazar 1983, 22).

Much biblical scholarship has been devoted to demonstrating how the Biblical covenants were modeled after ancient Middle Eastern suzerainty treaties. The language, the ceremony and the implications of the two agreements are largely the same. Interpreting the meaning of the suzerainty treaty is made difficult, however, by the complexities of the treaties themselves (Hillers 1969). Scholarship is also divided upon the timing and manner in which the concept of covenant entered the canon. Julius Wellhausen's famous *Prolegomena zur Geschichte Israels* concluded that "covenant was a late development and came about as a result of the preaching of the great prophets (Nicholson 1986, 3)."

Elazar's study, however, points out the critical difference between the suzerainty treaty and the content and meaning of covenant in the Old Testament. Even though the Hebrew covenant resembles the ancient treaties, it "is utterly

transformed and infused with a new character . . ." Elazar describes the character of the transformation:

> In essence, the Israelites took the idea and techniques of covenant making from their neighbors but turned them on their head. Mesopotamian and West Semitic covenants were designed to limit previously independent entities by making them vassals, regulating their external behavior, but leaving their internal life alone. Israelite covenants function as liberating devices that call into existence new entities. God, by entering into a covenant with humans, accepts a limitation on the exercise of His omnipotence, thus endowing mankind with freedom, but its price is the acceptance of internal reform as well as external obligations. The covenant becomes the framework for mutual obligation and the basis of a new law and politics internally and externally (Elazar 1983, 23).

Gordon Freeman, in *The Rabbinic Understanding of the Covenant*, points out that one of the most important implications of this interpretation of the covenant is that it "emphasized the reciprocity of the relationship between the ruler and the ruled" (Freeman 1983, 59). For Freeman, the arrangement describes an organic communal unity, the substance of which is mutual respect and freedom.

Covenant is therefore the model for the Old Testament polity. Elazar notes that
"the Bible necessarily holds that the covenantal relationship is also the only proper basis for political organization . . ." (Elazar 1983, 24). He goes on to state, however, that a covenant doe not necessarily require one particular political regime. Elazar's view is that Jewish covenant polity is essentially republican, but may be aristocratic as much or more than democratic in its historical expression. But this view of covenant is a result of the fact that Elazar approaches covenant from an Old Testament perspective. The Old Testament covenant is temporal: it describes the acceptable bounds of earthly human social and political activity. It speaks to a community rather than to individuals. A second general form of Biblical covenant, found in the New Testament, has its roots in the Old. It is a spiritual covenant which, having strong implications for community, is addressed directly to individuals.

The New Testament (Individual) Covenant

The New Testament covenant is, in the Christian tradition, predicted by the eighth century prophets. Jeremiah proclaims:

> Behold, the days are coming, says the Lord, when I will make a new covenant with the house of Israel and the House of Judah, not like the covenant which I made with their fathers when I took them by the hand to bring them out of the land of Egypt, my covenant which they broke, though I was their husband, says the Lord. But this is the covenant which I will make with the House of Israel after these days, says the Lord: I will put My law within them, and I will write it upon their hearts; and I will be their God, and they shall be My people. And no longer shall each man teach his neighbor and teach his brother, saying, Know the Lord, for they

> shall know Me, from the least of them to the greatest, says the Lord; for I will forgive their iniquity, and I will remember their sin no more (Jeremiah 31: 31-34).

Abraham Heschel, in *The Prophets: An Introduction,* concludes that "the climax of Jeremiah's prophecy is the promise of a covenant which will mean not only complete forgiveness of sin (33:8;50:20), but also a complete transformation of Israel" (Heschel 1962, 129-130). Whereas the old covenant establishes a *differentiated relationship consisting of a promise* contingent upon specified social behavior of the people, the new covenant promises a relationship established by forgiveness of the people's inability to sustain the expected behavior. "What the prophets proclaim is God's innate relatedness to man" (Heschel 1962, 219). The promise of a new covenant is repeated in II Isaiah 59:21: ". . . this is My covenant with them, says the Lord: My spirit which is upon you, and My words which I have put in our mouth, shall not depart out of your mouth . . . says the Lord, from this time forth and for evermore."

Elazar clearly describes the transformation of the old covenant into the new: "Christianity reinterpreted the old biblical covenant that established the Jewish people as a polity into a covenant of grace between God and individual humans granted or mediated by Jesus" (Elazar 1991, 246). The old covenant binds the community of Israel to communal political and social arrangements that reflect the will of God. The new covenant establishes a direct spiritual relationship between each person and God. Whereas the old covenant is primarily political and communitarian, the new covenant is essentially spiritual and individualistic.

The Constitution as Covenant

To what extent does the Constitution reflect, first, the *old* covenant? For the purpose of answering this question, the old covenant may be viewed according to three primary aspects . The old covenant may be viewed as (1) an agreement between the people of Israel and God, (2) an expression of a human inclination to bind into "federal" communities in which mutual trust and respect may grow, and/or (3) as a divine format for human polity.

If viewed as an agreement between man and God, the Constitution is not a covenant. The Constitution does not mention God or divine purpose. The Constitution of the United States is an agreement among men (in practice, free male property holders). In this sense it is a thoroughly secular document. The Mayflower Compact, by clear contrast, was written for the express purpose of furthering the Kingdom of God on earth. Divine approval was its source of authority. The basis of authority of the Constitution, however, is nothing other than the consent of the ratifying states.

H. Richard Niebuhr and Daniel Elazar are among those who view the Constitution as a covenant in the second sense: an expression of a human inclination to bind into "federal" communities in which mutual trust and respect may grow. In this view, the Jewish tradition imparts to the world the legacy of covenant-thinking which carried itself all the way to the Constitution. Niebuhr declares that first of all "One of the great common patterns that guided men in the period when American democracy was formed ... was the pattern of the covenant or

of federal society" (Niebuhr 1954, 129). Niebuhr sees the Constitution as more than merely a social contract in the formal sense:

> Covenant meant that political society was neither purely natural nor merely contractual, based upon common interest. Covenant was the building together in one body politic of persons who assumed through unlimited promise responsibility to and for each other and for the common laws, under God (Niebuhr 1954, 133).

Elazar takes Niebuhr's analysis a step farther. For Elazar, a covenant may be defined broadly as one of the three major modes by which governments are established. "Since its beginnings, political science has identified three basic ways in which polities come into existence: conquest (force), organic development (accident), and covenant (choice)" (Elazar 1991, 232). "Covenantal politics are directed simultaneously toward linking men and communities as partners in common tasks and allowing them space in which to be free" (Elazar 1983, 25). The important element in this view of covenant is a desire to form a community with a common purpose, based upon mutual trust. This model is organic and communitarian. Elazar sees a spirit of covenant leading the Founding Fathers, and concludes that "The Constitutions of the United States in the founding era were perhaps the greatest products of the American covenant tradition" (Elazar 1980, 14).

It is at this point, however, that finding the Constitution to be a descendent of the old covenant encounters an important difficulty. The Preamble states the Constitution's purposes, which include the general welfare of the people. But this is not quite "covenant language" in the sense intended by Niebuhr and Elazar. A further question, then must be raised: "Is covenant implied in the language of the Preamble?" Perhaps. Perhaps not. The language itself is unclear as to whether its authors assumed that a covenantal relationship was necessary, or whether the Constitution was merely a legally binding limited social contract which implied far less mutual commitment. The conclusion that the Constitution is a covenant is therefore not demonstrated by explicit Biblical language, and rests upon demonstrating that the intent of the Founders was to implement the organic, communitarian model. Furthermore, there is certainly a viable alternative model to "Constitution as covenant": "Covenant as limited social contract." The Constitution my more accurately be described as a limited social contract which assumes a plurality of competing factions. This perspective, expressed most fully in Federalist 10, views as the essential drive of the Constitution not the "positive" motion towards communal unity, but instead the more "negative" desire to deter the violence of faction. It assumes conflict. It sees a plurality of cultures and expects the vitality of the nation to be maintained if there is as little opportunity as possible for a minority or a majority to oppress the whole. The social contract, therefore, is a document demanding minimal obligation, in the contemporary sense of contract. It binds the parties only to the limited expressed terms of the contract, and nothing more. Elazar himself explains the difference between covenant and contract:

> The idea of covenant is ambiguously related to the terms compact and contract . . . Both covenants and compacts differ from contracts . . . as

> expressions of private law, contracts tend to be interpreted as narrowly as possible so as to limit the obligation of the contracting parties to what is explicitly mandated by the contract itself . . . A covenant differs from a compact in that its morally binding dimension takes precedence over its legal dimension (Elazar 1991, 250-251).

Niebuhr makes the same point, and ironically describes the trap into which both he and Elazar may have fallen:

> On the other hand the covenant idea was confused with the idea of contract from which it had in part derived. But contract meant something rather different from covenant. ...Contract always implies limited, covenant unlimited commitment; contract is entered into for the sake of mutual advantages; covenant implies the presence of a cause to which all advantages may need to be sacrificed. The tendency of the covenant idea to degenerate into the limited contract idea is evident in all the later religious and social history (Niebuhr 1954, 134).

The question of the moment, then, is this: is the Constitution, in the terms described above, a covenant, or a contract? The answer may seem complicated, but is deceptively simple. The Constitution is neither necessarily a morally binding covenant nor a strictly limited contract in these terms. It is an agreement which may be interpreted as either. In fact, many arguments between North and South, strict constructionists and judicial activists, conservatives and liberals are the result of this fact. The Constitution's most conspicuous feature is that it is clearly open to interpretation. It demands no more than contract but provides a stable foundation on which a covenant community may be built. Those who wish to see it as a morally binding covenant are free, pointing to the *spirit of the law* in the tradition of John Marshall or Earl Warren, to press for a society which expresses the Constitution's undeniable covenant potential. Those who wish to see the Constitution as limited contract may cite Federalist 10, point to the *letter of the law*, and claim freedom from the communal bond to march to the beat of a different drummer.

Kingdom

Forms of Kingdom

The second question raised by the analytical construct is "What form of polity is to be found in the Bible?" Polity, in biblical terms, is found in a number of forms that, for the purposes of this paper, are placed together, under a Biblically-friendly umbrella called "kingdom." Kingdom is found in two basic forms in the Old Testament and in two other forms in the New Testament. This section will define the four Biblical forms of kingdom and compare each to the polity created by the Constitution in order to determine the similarity of the two documents on the subject of governance.

Old Testament political regimes may be readily divided into two types according to the extent of authority represented by community leaders. The first type is herein called theocracy. In this kind of regime God rules the people

directly. Leaders, whether prophets or judges, resolve disputes or deliver divine commands, but rule is directly from God to the people. The second type is called monarchy because a king intervenes between God and the people. Biblical monarchy began when Saul was called upon through Samuel. Samuel responded when the people, rejecting God, demanded a king. The king represents divine political authority in a more consolidated and potent form.

New Testament regimes may be differentiated into (1) existing temporal powers (exousia), such as the Sanhedrin and the Roman Empire, and (2) the alternative to politics, the primary mission of Jesus, the Kingdom of God.

Theocracy

Theocracy was rule by God. Patriarchs, prophets and judges held discretion in certain limited community decisions; not under divine grant of political authority, but as spiritual leaders. Their political leadership was only as effective as the perceived validity of the divine revelation they proclaimed. Their rule was marked by prayer rather than organization, by humility rather than rhetoric, by proclamation rather than by force. Abraham, Moses and Samuel lived in tension with politics rather than being fulfilled by it.

The Constitution in no significant respect ***necessarily*** creates a theocracy. While it may be said that the population hoped for divine guidance in political decisions, that guidance is not provided for anywhere in the body of the document. There is no position of chief priest. There are no days set aside for national prayer or fasting. On the other hand, if theocracy involves consists of a situation in which there is no authoritative intervention between God and the people, then *to the extent* that the people rule and are led in turn by God, the Constitution as an instrument of democracy creates the ultimate opportunity for theocracy. In terms of contemporary politics, then, the question "Does the Constitution create a theocracy?" is irrelevant. The question "Should American democracy, under the Constitution, become a theocracy?", however, is salient at least for the religious right.

Monarchy

> But the thing displeased Samuel when they said, "give us a king to judge us." So Samuel prayed to the Lord. And the Lord said to Samuel, "Heed the voice of the people in all that they say to you: for they have not rejected you, but they have rejected Me, that I should not reign over them." (I Samuel 8:6-7).

If theocracy is direct rule of the people by God, then monarchy is a rejection of theocracy. Elazar makes the case that the shift from judges to kings was purely practical politics. He concludes that the end of rule by the judges "was a result of external forces rather than weakness *per se*. "A non-centralized polity based upon a loose federation of tribes could not stand up to the assaults of the Philistines" (Elazar 1983, 28). But if the creation of monarchy was politically motivated, its theological implications are profound. The victories of Joshua had not required a king. The active participation of God was more than adequate to secure them. The walls of Jericho fell. Hailstorms consumed the enemy at the

critical moment. Vastly superior numbers were defeated time and time again. Why would anyone want a king when this type of support was available? It appears most likely that Israel's demand for a king demonstrated a profound lack of faith, and a certain and direct rejection of the rule of God. This was neither, of course, the first nor the last time that Israel would reject God. Hillers notes that "Once there was a king in Israel, there was no promising soil left for growth of the idea of a covenant of the people with Yahweh, family by family" (1969, 73). It is possible to conclude from this that the next covenant, the Davidic covenant, was very different from the theocratic covenant. Hillers suggests further that David needed a "theory of kingship" to support his authority, and that David drew on other Middle Eastern traditions to solidify his rule. Nicholson describes this process:

> The perception of the divine ordering of the world likewise informed the ideology of kingship in the ancient Near East. The king--whether as an incarnation of the creator god or as a 'son'--was the divinely appointed viceregent of the creator deity and as such was seen as the earthly guardian of the order of the things they willed; he was responsible through his actions and functions for the social and political well-being of the state, including the fertility of the land.(Nicholson 1986, 195).

Much more than merely temporal rule, then, may have been transferred from God to King in the minds of David's contemporaries. But perhaps this is what the people had in mind, for David was successful in replacing the order of the judges with the monarchy. He did this by describing his rule as a continuation of the regime of the judges. "David is thus presented as the ideal leader of the theocracy, the consummation of what a "judge" should be, while in the very act of substituting hereditary monarchy for theocracy (Hillers 1969, 111). Elazar even points out that the shift from the rule of the judges to monarchy was so important that a new covenant was necessary. (Elazar 1983). Even if monarchy placed an intermediary between God and the people, however, the legitimacy of the monarchy remained dependent upon God's will.

To what extent, then, is the Old Testament monarchy reflected in the Constitution? Less than the theocracy. The powers of the President and Congress are neither legitimated nor limited by God. Divine descent does not play a part in the selection of government officials. The comparatively unlimited powers of the monarch are not equivalent to the limited and shared prerogatives of the executive and legislative branches of American government.

Exousia

The New Testament is in substantial part the story of the conflict of the "kingdoms of this world" in opposition to the "kingdom of God." In Romans 13 Paul declares the duty of the Christian to obey the exousia, the temporal powers. For his listeners, that meant the Roman territorial governors and the local authorities. Roman jurisdiction may be characterized as authoritarian as opposed to totalitarian. It often left local affairs to the subject people as long as taxes were paid and order was not threatened. Roman regimes varied from imperial to republican. In Israel a council of ruling elders, the Sanhedrin, had placed itself

in succession of the monarchy and ruled within the tolerance of the Roman governor.

It is difficult to find structural parallels between the patriarchal priestly rule of the Sanhedrin and the Constitution. There were in the Hebrew scriptures provisions for limited deliberation and for criminal procedures. The Law prescribed strict requirements for religious life and observance, and it was the first duty of the local religious officials to be guardians of its integrity.

As for Roman rule, the accumulated republican traditions as related by Cicero and others were widely read and studied by the Founding Fathers. In fact, the similarity between Cicero's concept of "mixed government" and the combination of aristocratic and democratic features of the Constitution of the United States is no historical accident. From Machiavelli to Montesquieu, the merits of republican thinking had been discussed and evaluated.

But republican Rome is not discussed in the New Testament, nor are republican principles in general. The Constitution may well have been modeled upon certain Roman republican institutions, but the noble document of 1787 can hardly claim to draw its republican lineage from the Bible. The most that can be said is that the Bible does not discourage republican government, or that its spirit encourages it.

Kingdom of God

> Jesus answered, "My kingdom is not of this world. If my kingdom were of this world, My servants would fight, so that I should be delivered from the Jews; but now My kingdom is not from here. (John 18:36)

At the outset of his ministry Jesus declared his mission was to fulfill the prophecy of Isaiah by announcing the Kingdom of God. The largest part of his teaching was in the form of parables, and the largest part of the content of the parables was allegorical representation of the Kingdom of God. If politics is the struggle to see who gets what, when and how, then the best definition of the Kingdom of God is the absence of politics. The Kingdom of God is not the temporal kingship, the reestablished Davidic kingdom expected by the Zealots. The kingdom of God is a spiritual kingdom, at once present and yet to come. If the true meaning of theocracy is direct rule of the people by God, without an intermediary, then there is a way in which the Kingdom of God reinvents the Old Testament theocracy, placing it on an individual level for each person to see and feel. C.H. Dodd describes the character of the Kingdom of God as revealed in the parables of Jesus:

> First, God is King of His people Israel, and His kingly rule is effective in so far as Israel is obedient to the divine will as revealed in the Torah. ... In this sense 'The Kingdom of God' is a present fact. But in another sense 'The Kingdom of God' is something yet to be revealed....It is itself the eschaton, or 'ultimate,' with which 'eschatology' is concerned . . . it is neither an evolutionary process nor a catastrophic event in the near future, but a present crisis. It is not that the kingdom of God will shortly come, but that it is a present fact; and not a present fact in the sense that it is a tendency towards righteousness always present in the world, but in the

> sense that something has now happened which has never happened before (Dodd 1961, 22-23; 142-143).

If the kingdom is both present and future, it is also highly individual. Thomas Sheehan notes that the Kingdom of God broke down the strict differentiation of God and people that had been established in the Torah.

> This immediate presence of God as loving Father [Abba] is what Jesus meant by the "kingdom." . . . This entirely human orientation of the Father--the loving, incarnate presence of a heretofore distant Sovereign--marked the radical newness of Jesus' message of God's reign. . ... That is, Jesus destroyed the notion of "God-in-himself" and put in its place the experience of "God-with-mankind" (Sheehan 1986, 60).

The essence of the New Testament's Kingdom of God is, therefore, the transcendence of politics through a close individual relationship with God. When questioned about the propriety of paying taxes, Jesus's "render unto Caesar" implied that the things due to Caesar were necessarily of the relatively unimportant temporal realm. Jesus began no political program. His aim was anything but establishing political rule. His teaching had profound political implications, but that is only because it taught that the Kingdom of God meant turning away from the substance of politics: gaining a share of money and power.

In what sense, then, is the Kingdom of God reflected in the Constitution? Directly: not at all. The Constitution is a plan for distributing political power and for a controlled opening of participation in public policy. Indirectly, however, the Constitution allows the individual to transcend politics, to seek first the Kingdom of God, to remain apart from the political process and still retain fundamental rights and privileges. It creates a structure, in fact, in which the Kingdom may be pursued through a wide variety of traditions. To conclude, the Bible presents several forms of and responses to polity. The Constitution copies directly none of them. It does allow, however, for many aspects of them to flourish.

Culture

Biblical Culture

The final question is the extent to which the Constitution expresses the values of Biblical culture. The two cultures from which values might be imported to the Constitution are the communities of Old Testament Israel and New Testament Christianity. The two communities had similarities and differences, which shall be briefly explored in turn.

Both Hebrew and Christian communities existed, as sociologists would describe them, as preindustrial peasant, agricultural, fishing and commercial societies. In religious terms, both were holy and evangelical. Holy, in this case, means separate--set apart to the service of God. Both were evangelical in that their service to God was to be testimony of his person and will to surrounding communities.

Politically, their concern was achieving unity in community rather than expression of individuality. In this sense they share the preoccupation of ancient societies to regain a sense of unity which was lost when their differentiation from God first became conscious through God's revelation to Israel (Nicholson 1986). Only at the end of the middle ages did the primary political question change from "How can unity (in a chaotic community) be established?" to "How can distinct individual expression, within the ordered community, be secured?"

This is not to say, however, that both communities did not raise the inherent value of the individual to a prominence not previously historically evident. In the Old Testament the manner in which the individual orphans and widows were treated was the very symbol of obedience or nonobedience to the will of God. In the New Testament God appeared as a divine being who knows the number of hairs on every individual's head, and who leaves the flock to find the one lost sheep. The dignity and value of the individual was the strongest single political legacy of the Bible.

Another feature of Biblical political culture was a hierarchy of law. God's commandments superseded any temporal political regulation. The Greek and Roman concepts of natural law were immeasurably strengthened by a jealous God who would have no law before his own. The final continuous feature of Biblical political culture to be mentioned here is the necessary divine sanction of leadership. Prophets, priests, kings and apostles alike needed the divine imprimatur to assume rule.

For political culture, then, what were the important differences between the Testaments? The first was a sense of universality. Israelite and classical Athenian culture had both been parochial. The people of God were set apart for a special unity, a special mission, not experienced by rest of the world. The Delian league suffered under a not always benevolent Periclean patrimony. It was the Greek empire under Alexander first, but more importantly the Roman empire which brought a sense of universal citizenship to the political realm. The Old Testament parochiality dissolved in the universality of the New Testament community, led by Paul's commission to preach to the gentiles.

The second difference between the Testaments is the role of temporal politics. The Old Testament's messiah would come to restore the Davidic kingdom. Prosperity and self-rule would return to Israel. Politics, Hebrew style, would flourish. In the New Testament community, however, political wrangling among the apostles was a curse only overcome by revelation from God. The present kingdom of God was one of equality, service, giving up wealth to the poor, and directing civic matters in a prophetic or priestly rather than in a kingly mode. The coming kingdom would end politics in a new heaven and new earth in which the lion would lie down with the lamb.

The Constitution and Biblical Culture

What can be said, therefore, in comparing Biblical culture and the Constitution? The Constitution seems to reflect little of some aspects of Biblical culture. First, it mentions nothing of America as a holy nation, set aside to the service of God. This is not to disregard the fact that many Americans in 1787 may have, as a result of Puritan influence, viewed things this way. Reichley notes, quoting Sydney Ahlstrom, that "The single most influential cultural force at work

in the new nation was the combination of religious beliefs and social attitudes known as Puritanism." This influence was pervasive indeed, if we accept Ahlstrom's estimate that "At the time of the revolution, at least 75 percent of American citizens had grown up in families espousing some form of Puritanism" (Reichley 1985, 53). Mark Noll describes the effect that Puritan thinking had upon some in the new republic:

> In Puritan rhetoric the iron law of God's covenant explained all. This covenant, rather than the science of politics, determined the course of American history and represented the lens through which the nation-state was viewed. Obedience to God's covenant and His prophets was the sole criterion by which America would stand or fall (Noll 1990, 67).

By the middle of the eighteenth century, the idea that "America had a special place, as yet not revealed, in the architecture of God's intent was pervasive in the American colonies" (Wardle 1987, 19). For Puritan thinking, America was God's nation, and the Constitution was God's covenant through which to work out his purposes in history. As Reichley notes, however, Puritanism was not the only kind of thinking current at the time. "If Puritanism was the most important intellectual and cultural force shaping the American mind in the second half of the eighteenth century, the European Enlightenment was unquestionably the second" (Reichley 1985, 85). It was this Enlightenment thinking, rather than the rhetoric of Puritanism that shaped the writing of the Constitution. The Constitution itself reflects much more of the limited social contract and separation of powers concepts of Locke and Montesquieu than it does notions of a holy priesthood or sacred nation. It also rejects selecting political leadership upon a basis of divine annointment.

If the Constitution does not directly reflect Puritan ideas or God's special providence for America, does it reflect other aspects of Biblical political culture? Two Constitutional features are important in this respect. The first are the safeguards which directly imply the value of the dignity of each individual. The second is the provision for constitutional change, and regime change under the Constitution. A part of the Puritan tradition which carried forth into the Constitution was the right of revolution. Kenneth Wald has found that the Puritans interpreted their covenant with God to be superior to the covenants which form governments, in which the king has an obligation to purvey divine justice. The governmental covenant could be broken if it became destructive of divine ends. "The breaking of the covenant not only entitled the people to withdraw authority from a corrupt government, but, as the Declaration also emphasizes, authorized them to form a new system of rule"(Wald 1987 40).

At this point, however, is important to distinguish the Puritan tradition from the Bible. The Bible states directly no right of revolution. Nor are political rights anywhere to be found therein. In the Old Testament obedience to the king, right or wrong, was repeatedly emphasized. Moses, who undertook the chore reluctantly, brought God's charge to the pharaoh, in respect to the pharaoh's authority, three times, demanding, "let my (God's) people go!" Moses did not attempt to become pharoah. David refused to kill Saul when he had the opportunity, waiting instead for God to place him in temporal power.

In the New Testament the clearest statement on the subject of obedience to government, Romans 13, gives little support to the right of revolution. Further, the concept of rights is foreign to the New Testament. Jesus never tells the assembled masses that they have the right to the property of the wealthy, to a fair trial, or to anything else. He never tells the rich that the poor have a right to their possessions. Instead, responding to their questions about the Kingdom of God, Jesus points to the wealth of the rich and to the poor whose needs are not being met, and tells them that if the Kingdom of God is what they seek, they can find it by giving their wealth away. When confronted by Pontius Pilate, Jesus never alludes to rights, although he may properly have done so considering the development of the concept of rights in the Roman tradition. When Paul demands the privileges of Roman citizenship he does so as a matter of expedience, and not in a philosophical defense of civil rights.

The concluding point is that the political safeguards of the Constitution may in part be derived from the culture of the Roman empire, but not from the political culture of the Old or New Testaments, per se.

Conclusion

What was the influence of the Bible upon the writing and content of the Constitution of the United States? Directly, very little. There probably were some among the Founding Fathers who hoped for a community with the unity of spirit implied by Daniel Elazar's broad definition of covenant. If so, they did not directly express those sentiments in the document itself. Covenant may be "read in" or "read out" of the Constitution, according to the perspective of the reader. The Bible directly reflects neither the theocratic nor the monarchical "kingdoms" of the Old Testament. It follows the structures and processes of neither the exousia of the Sanhedrin or imperial Rome, nor the apolitical or antipolitical spirit of the Kingdom of God. The American Constitution much more closely reflects the political culture of fifth century Athens or the Roman Republic than it does holy nation of Israel or the Christian community led by the apostles.

The Constitution does directly provide protection for the individual and for his dignity. Its federal structure, as Daniel Elazar has taken great pains to show, allows a covenant community the opportunity to develop. But ultimately, Elazar teaches us more about the potential of the Constitution than its requirements. The division of power to impede the tyranny of the majority reflected in every article of the Constitution may well be viewed as an alternative model to covenant government. In fact, this model may express a fundamental distrust of the covenant model. The genius of the Constitution is that it *requires* no longing for covenant, no quest for holiness, no anticipation of Christian charity; but it opens a field in which may be grown all these and more.

ARENDT AND THE GERMAN SOCIAL SCIENCE EMIGRES ON AMERICAN LIBERAL DISCOURSE

The following is the introduction to a research project studying the impact of German social science emigres on the emergence of Cold War liberalism from the late 1930's through mid-50's. With a research team of graduate and undergraduate students, and working together with political science and linguistics faculty at EMU, I am reconstructing the mentalite of the sizeable German emigre community who wrote for the "little" journals of New York such as Social Research, Partisan Review, Commentary and Dissent, as well as for academic publications in their respective disciplines. A quantitative analysis of key terms in context for 19 emigres is in process (see Appendix) in order to map the terrain of discourse. The core of the study, however, is a two stage qualitative inquiry. The first stage, introduced below, looks into the interrelationships of language, norms and professional vantage points among the various sub-groups of emigres. The second stage will chart similarities and differences between their varied perspectives on the American consensus and that of their American intellectual counterparts in New York. (1)

I. Background

The emigre study has grown out of my research Hannah Arendt and her writings in Germany and America. (2) I have been reviewing the considerable holdings of her correspondence, as well as published and unpublished manuscript texts in the Library of Congress in the past few years for the purpose of publishing a critical edition of Arendt's doctoral dissertation on Saint Augustine. Following this academic bread crumb trail led me to speculate on broader connections between the life of her mind and that of her fellow emigres. It seemed more than coincidental that the first evidences of the strange death of American liberalism and its rebirth as "hard", "liberal anti-Stalinism" coincided with the appearance of the German emigres' writings on the origins of totalitarian ideology in liberal mass democracies.

My intent in developing and testing this hypothesis is to place Hannah Arendt's German phenomenological roots and later American political perspective in their most appropriate cultural setting--the German emigre social scientist community's distinctive perspective in, and on, America. The broader context for the emigre project, however, is the bracketing of "America" as an object of study and of celebration from the 1930's through 50's. The process of discovering liberal America characterized not only the emigres who had been "inserted" as "newcomers" (to borrow Arendt's terminology), but also the community of "New York Intellectuals" in the arts and social sciences. In the mid-1930's the latter had already begun to agonize over apparently irreconcilable, and European-inspired, ideological imperatives such as: "modernism", "radicalism", "social realism", "new criticism", "regionalism", "American liberalism", "realism", and "regionalism". It was in the process of mutually searching for critical vantage

points in this rapidly shifting terrain that the Germans and the New Yorkers came to terms with each other.

Townsend Ludington, the biographer of both the writer John Dos Passos and the artist Marsden Hartley, captures the period's obsession with defining, claiming and proscribing the nature of American life and the appropriate role of cultural elites in its representation.

> ...artists of the United States turned toward their country during the 1930's and 40's...to treat their native culture more specifically then ever they had done before.... Just how much the art was a case of the painter looking inward or outward--by which I mean how much they were governed by native instincts or by the examples of Europe -- is not a matter we can settle. We can agree, however, that there is an American art; that in the 30's and 40's much of it was related to the general issue of what it means to be an American and that the art is closely related to what was occurring in other forms of cultural expression. (1990, 278-79)

The emigres' overall perspective on what it meant to be an American did not remain encapsulated in their own community of discourse after arrival but was affected by, and in turn had an impact on, equivalent discussions on the meaning of the American experience among the New York intellectuals writing for important journals with an elite readership. From the partial but significant overlap of concerns and language emerged a shift in the "consensus" toward a hardening and narrowing of liberalism's parameters in America. Liberal anti-communism replaced the "dough-faced progressives" castigated by Arthur Schlesinger in his classic The Vital Center (1949).

The primary motivating force for this transformation was the looming presence of totalitarianism. Though the term was in common usage by the mid-1930's among German sociologists and economists of the New School it was made an American household word by Hannah Arendt in her instantly classic study, Origins of Totalitarianism (1951, 1958). By contrast Emil Lederer's comparable study , State of the Masses: The Threat of a Classless Society, (1940) was more typical of the genre of mass society critiques favored by the emigres but because of its academic mode of discourse its impact was more limited.

Unlike Arendt, Lederer's main focus was the phenomenon of the "mass" rather than its political expression in totalitarian ideology and state forms. The first chapter discussed "Masses and Classes" and broke the subject down into: Social Groups; The Psychology of Groups; Multitudes; Masses or Crowds; Mass-Action and Leadership; 'Abstract' Masses; The Totalitarian State: The Mass-State. His colleague, Hans Speier who had also written frequently on totalitarianism and the mass state in the 1930's, explains Lederer's central thesis that "the modern dictatorial state, the state of the masses...had no tradition" (Preface, Lederer, 10). So unprecedented was the Nazi State in Lederer's mind that, according to Speier, he believed it required nothing less that the

"revision of all our thinking on society, evolution, revolution and the transformation of the economic system" (10). Speier reminds his American audience that for Lederer revision meant abandoning the Marxist "myth" of a classless society. "Thus as a socialist and a valiant antifascist, the author discovers the social value of classes and differentiation in group life." (11) Totalitarianism as he observed it Europe from American exile was the catalyst for what Lederer's adoption of a "liberal" view of "pluralistic" democracy.

The points of convergence between the Lederer-Speier view and Arendt's in 1951 are as clear as their differences. Arendt, too, would celebrate pluralism, coining her own term -- "plurality". And like them she would view totalitarianism as evidence of a fundamental "break" in European history and the "tradition" of political thought. She and Lederer also agreed, at least initially, to exempt America from the developmental continuum moving inexorably from mass democracy to the totalitarian state. However, Arendt went beyond her colleagues and became a "covergirl" on the cover of Time as a result of her dramatic depiction of "radical evil" in the camps, the destruction of freedom by the relentless logic of ideology and the shared complicity of both Marxism and Fascism in the totalitarian phenomenon. Despite delays in finding a publisher which she finally overcame with the help of Alfred Kazin, Arendt's message had been well timed for maximum impact among the New York intellectuals. An emerging "hard liberal" audience, among whom was Arthur Schlesinger, was delighted.

Adopting a popular mode of discourse, Schlesinger's Cold War attack on left liberals and socialists in The Vital Center was an equally dramatic example of the "exeptionalist" genre of American Cold War polemics which appeared across the cultural spectrum by the end of the 1940's. Invoking Hawthorne and George Norris, La Follette and Eugene Debs against "totalitarian" and, by definition, foreign ideological influences, Schlesinger claimed an authentic American "center", named it liberalism and carefully circumscribed its limits. Radical intellectuals make poor liberals, Schlesinger insisted, but radical democratic politicians make great ones (164). Reformist politicians, whom he termed the new radicals, should model themselves on Andrew Jackson and Franklin Roosevelt and "regard liberalism as a practical program to be put into effect" within the constraints of centrist compromise. (159) The old radicals' dream of culture wars in the name of absolute social justice ignored the danger their ideologies posed to the fundamental and uniquely American values of liberty and constitutional government. Schlesinger warned that the old liberals and radical intellectuals of the 1930's had been duped by "Communism (which has) draped itself ... carefully in the cast-off clothes of a liberalism grown fat and complacent" (163).

An important benchmark of intellectual migration occurred as Schlesinger referenced (without footnotes) the work of a young immigrant from Germany, Hannah Arendt, who had become a new authority on the menace of totalitarianism. (See: 77, 87) The comment, in fact, predates the publication of Origins and must be based on her journal articles of the mid to late 1940's. Having

previously quoted Reinhold Niebuhr who was already the guru of anti-utopian liberalism, he goes on to include the "brilliant" Arendt.

> Fitzhugh's slave plantation was a relatively amiable mid-Victorian beau ideal of Communism. The image of twentieth-century totalitarianism is infinitely more bleak and hopeless; it is, as Hannah Arendt has brilliantly argued, the concentration camp. For the essential dynamism of totalitarianism is toward the unlimited domination and degradation and eventual obliteration of the individual and only in the concentration camp does this process achieve its evil perfection. (87)

Schlesinger castigates "Doughface wailers" who "under the cover of American liberal values have pursued their utopian visions of human historical progress and moral perfectibility rather than focusing on the slow process of pragmatic reform within existing political parties and institutions. Instead of adhering to truly American "realism" and "civic responsibility", they delight in "passing resolutions against Franco, monopoly or sin". (160) Schlesinger's polemic is significant as evidence of Arendt's strategic placement in the American debate on liberalism, but it also shows that her role may have been more instrumental that formative at that early date. Yet his praise set the tone for the way in which the New York intellectuals would think about Arendt, at least until she parted company with many of them in her report on "Eichmann in Jerusalem" (1961 in The New Yorker)

Another important background consideration is the variability in means of ascent within the New York intellectual community Ironically, though she was the only female among the gifted students of the German existenz who reached New York, Arendt may have been among the most entrepreneurial and least supported by a trans-Atlantic network. In 1940, after escaping from a French detention center and arriving in New York with her husband and mother, she began working in Jewish relief agencies and as an editor for Schocken Books. The option of immediately beginning an academic life with its associated protections and obligations was not available to her. The circumstance of being an academic outsider but an insider in the Jewish and general New York publishing world meant that she had to build her own broad network rapidly. Later, friendships with Mary McCarthy, Alfred Kazin and William Jovanovich added to her visibility and reputation. Academic affiliation was the effect and not the cause of her stature in the New York community.

However, her cohorts such as Adorno, Horkheimer, Marcuse, Neumann and Speier, Strauss and Tillich, were brought over earlier with the direct help of American foundations (Rockerfeller, Carneige) and American academic colleagues in New York in order to begin immediate teaching or research assignments. As a result, their works were first published in specialized journals of their disciplines and in Social Research, while Arendt's pieces on the holocaust and European politics began appearing first in Jewish

journals, including the first issue of Commentary, and then in Partisan Review, The Nation then academic political science journals such as The Review of Politics.

Most of the sociologists, economists and political scientists found academic sponsors in America based on their research "fit" in New York universities such as The New School, The Bureau of Applied Social Research at Columbia and at the reconstituted Frankfurt School's Institute For Social Research, also initially at Columbia. (Lazarsfeld, 1968, 270-337; Adorno, 1968, 338-370; Neumann, 1953, 4-26) Arendt wasn't given the option of "fitting" and thus had no choice but to become a "public intellectual". It is doubly ironic that although she thought of herself as an outsider and adopted a mode of discourse unlike that of American academic audiences, Origins of Totalitarianism was immediately compelling to a broad spectrum of informed Americans who were transfixed by her oddly passionate yet detached analyses of the "crisis" of modernity. Even after her celebrity status was achieved, however, Arendt maintained a deliberate critical distance from institutional constraints until she accepted formal affiliation with The New School late in her career.

There is a poignant parallel between Arendt's self-image and that of another major female cultural icon of her generation, Georgia O'Keefe. Wanda Corn, O'Keefe's biographer, reports that she was vehemently opposed to discussing the question of influences and dependencies --including feminist affiliation. (National Endowment for the Humanities lecture, UNC, Chapel Hill, July 27, 1993). O'Keefe, like Arendt, had made her way in a man's profession and in the male-dominated cultural world of New York. She would give no other person or group credit for that, including her husband. Appropriately, Arendt's term for herself was "feminini generis", that is, a self-made woman.

The emigre project is similar in general approach to current work being undertaken in art history and literary criticism. Notable recent examples are Erika Doss' Benton Pollock and the Politics of Modernism: From Regionalism to Abstract Expressionism (Univ. of Chicago, 1991) and Lawrence H. Schwartz's Creating Faulkner's Reputation: The Politics of Modern Literary Criticism (Univ. of Tennessee, 1988). These works contextualize the career paths of major cultural figures noting the ideological implications of terms such as "modernism" when interpreted by varied critical and popular audiences. Schwartz makes it clear in his introduction that the primary reason for the New York critics' re-discovery of Faulkner after World War II was " ...the Cold War confrontation between capitalism and communism" which had its cultural counterpart in a "new literary consensus" focused on "anti-Communism" and "repudiation of the socially conscious literary traditions of naturalism/realism". Faulkner was no longer seen as a reactionary Southern litterateur but instead as a classic American individualist, both in his view of the South and in his aesthetic sense.

Prior to the war Faulkner was deemed "hard to read, often macabre and too involved with style" by critics such as Malcolm Cowley. After the War he was re-baptized as "a literary genius and a serious moralist" by the same critics. (Schwartz, 3) The easier

strategy of connecting Faulkner's regional voice to "democracy" wouldn't do, Schwartz argues, because democracy had been the rallying cry of the radical writers in the 1930's and, as a result, was appeared tainted by a decade of communist flirtation. "It had to be done through an elitist aesthetic...that claimed important literature was remote, complex, iconoclastic, inaccessible and required interpretation." (5) Most importantly, a modernist stance "universalized" the capitalist value of "freedom of the individual" and thus, by association, an American "hegemony" in the Post-War world order. (3, 4) It also, not accidentally, guaranteed the ascendancy of the New York critical community whose imprimatur "made" culture.

Schwartz is looking for a vantage point beyond literary criticism from which to evaluate Cold War cultural change and its impact on the literary canon. Doss' work has the same intent but tackles a more ambitious sample of cases. Choosing Benton and his student Pollock is a strategy which provides her with a richly ironic canvas. Pollock's modernism is generally acknowledged to have emerged from the brow of Benton's ideological regionalism in a classic instance of generational shift. Nevertheless, Doss argues, "Pollock attempted to sustain certain aspects of Benton's aesthetic and political strategies" which were in the New Deal democratic reform tradition. They were both bound to "an art of social contract" (1991, 1). However, as with Faulkner's pre-War identification, regionalism in art was out of favor by the 1940's, especially because some of its more outspoken advocates, such as Grant Wood and the Southern literary authors of I'll Take My Stand (1934), began to sound alarmingly fascistic in their Volkish celebration of agricultural life corresponding denunciation of the teeming, immigrant cities of the East. As a result, neither Benton's nor Pollock's skepticism about American corporate culture made it through the new critical net which filtered cultural taste in the Cold War. She observes that,

> Perhaps the most important influence affecting the art of both Benton and Pollock was politics, not as party tactics or organization, but as a set of cultural beliefs. That Benton was definitively linked with the New Deal had an enormous impact on the positive reception of his work in the 1930's and was in large part responsible for the dismissal of regionalism in the 1940's. That Pollock attempted to maintain certain aspects of a social reform aesthetic was largely ignored for very particular political and sociocultural reasons, by liberal critics and others who sided with the ideology of consensus and anticommunism after World War II. (4)

Or, as Serge Guilbaut puts it succinctly in another Cold War cultural study which Doss cites (1983, How New York Stole Modernism...) modernism in the arts and literature was a "weapon against totalitarianism" (1983, 4) because it emphasized abstract, conceptualized expression inaccessible to the masses without critical intervention by New York intellectuals. Documentaries, whether photographic or social scientific, which had characterized

the 1930's and early 40's would give pride of cultural place to individualistic outcroppings of elite culture, while fortress America braced itself politically for the Cold War.

Thus, at issue in this study is not only the emigres' political language, translated from German to American and back again, but the interpenetration of their political experiences and academic training with those of the New York intellectuals at a crucial transitional period in the evolution of the liberal tradition in America. The strategic placement of these eminent new Americans gave them the vantage point for multiple points of influence as they moved between overlapping communities in academic social science departments, academic journals, publications of literary and art criticism, and policy-makers writing for and reading print media in New York. They were able to provide a "new" commentary for New York audiences on political culture in America and the collapse of democracy in Europe from the vantage point of their own personal experience and academic expertise.

The problem of defining a German voice and mutual influences among the various intellectual communities in New York is a point of contention not only in focused studies such as those of Doss and Schwartz, but also among general inquiries into the phenomenon of the New York intellectuals and their influence. For example, Dennis H. Wrong takes a very dim view of Alexander Bloom's Prodigal Sons: The New York Intellectuals and Their World (1987) for its 1960's vintage leftist analysis. He says Bloom was correct that anti-Stalinism "was the fundamental bond uniting all New York intellectuals", but incorrect to explain that bond negatively as a "desire to cleanse liberalism, fear of the Right, and guilt over past radicalism." Instead, it was "a principled outlook adopted in response to historical events and conditions". This contretemps is typical of current retrospective critiques and probably greatly overstated by Wrong. He does, however, correctly note an important sin of omission in Bloom's study due more to cultural perspective rather than ideology. Unfortunately, the German and other emigres are only briefly referenced as significant but not central to Bloom's narrativre because of their alien cultural and educational origins. In this case Wrong is right. Bloom's assertion does run "contrary to the belief of just about everyone else." Even though the emigres were not American, "it was (the Americans') association with major European writers and thinkers that helped elevate the New York intellectuals to the status of an elite." (Wrong, 1987, 106-07)

For the quantitative segment of the emigre study a linguistics analysis approach is currently being pre-tested. Nineteen emigres so far have been selected as a sample, (see Appendix) with all journal articles produced from point of entry until 1968 surveyed. New York-based periodicals are the main focus of the current wave of study because of the relative rapidity with which they are published, and hence the currency of political references and modes of discourse. However, essays books and secondary source references for the emigres will be reviewed to assist in constructing the contextual mosaic.

Crucial contextual variables for our purposes are: temporal sequencing of publications, type of publication, academic degree

and mentoring, religious and political affiliation. We are pre-testing a random sample of 84 articles for key terms, context and measures of "affect", to see if a reliable mosaic of the emigres and their world can be constructed. After further adjustments to the key-term and concept list, all articles will be scanned onto disk and a discourse analysis program utilized to provide a complete mapping of patterns of word usage related to particular political and academic contexts in selected time frames, before, during and after the paradigm Cold War years of 1947-54.

The rather "crunching" aspects of linguistic analysis are intended to provide a road map indicating points of interest along the way which merit a further in-depth qualitative visit. Simple patterns of usage and meaning are of little value, even when placed in linguistic context, unless the researcher brings to the project a familiarity with the broader cultural setting of political discourse and adjusts evaluative paradigms accordingly. For example, frequencies for the term "totalitarianism" do not clearly demonstrate much more than the evident footprint of the German emigres. Patterns of influence can only be established from sources other than the texts themselves.

Another important consideration is that the emigres themselves in <u>most</u> cases transferred sub-group affiliations to America. So that the university of their doctoral degree, the professors who mentored them, their collegial groups and correspondents, as well as religious and political affiliations, were all at least partially causative in their interrelationships in America. The Husserl-Heidegger-Jaspers-Bultmann students naturally clustered together as did those who had been, and continued to be, affiliated with the Institute For Social Research based in Frankfurt. However, these groups also overlapped somewhat and common academic background did not preclude substantial differences in political and methodological preferences.

Even so, Lederer's study crosses a number of these boundaries and is therefore useful as a typical example of the main points of consensus and differences among the emigres at least with respect to the meaning of totalitarianism. Arendt and some of the Heideggerian group were more comfortable with the term's drastic application as a blunt instrument with which to condemn Marxist socialism through guilt by association. This usage directly intersected the agenda of American intellectuals in the arts and sciences struggling to achieve a specifically American and therefore pragmatic "realism", rather than one linked to European ideologies. But among the other emigres in New York, and particularly New School, Frankfurt School and Bureau of Applied Social Research faculty, the term retained its original more complex, and less directly polemical usage as a "social" phenomenon. Many of them had been, and would implicitly remain, European Social Democrats and continued to view totalitarianism as primarily a function of cultural, economic and social stresses in Germany and Italy which had fundamentally destabilized liberal democracy.

Judging by frequency of usage, Horkheimer, Lederer, Kirhheimer and Speier preferred a term with more general analytic reach --"mass democracy". It formed a bridge from their critique

of modern political phenomena in Weimar Germany to an assessment of the cultural distance between New York intellectuals and "main street". In Adorno's radio music study for Lazarsfeld's Princeton Project, in subsequent studies of anti-semitism, as well as in the other emigres' studies of mass society, they argued that specifically American mass culture, especially when viewed from both Los Angeles and New York, demonstrated the leveling, conformist and parvenu tendencies its European counterpart -- but not necessarily its fascist institutional structures and ideology.

Looking back four years after returning to Germany, Horkheimer and Adorno's 1954 lectures on "Frankfurt contributions to Sociology" make explicit a theme from the 1930's linking mass democracy and conformist, aspects of American society. The subject of their commentary is the Lynds' study of "Middletown" which had been an American empirical verification of a phenomenological analysis already well advanced among the Germans in the 30's. Thus Horkheimer and Adorno warned that,

> Those towns of the American Middle West ... are frighteningly similar." Sociological analysis demonstrates psychic as well as behavioral patterns of "conformity, standardization, and desolation." (1956, 152)

Even Arendt had public second thoughts in a 1974 lament over the Executive Branch's corruption of the Founders' intent (1974, NYRB, "Home To Roost"). She speculated that the gap between America's past and its future might be determined by a home-grown bureaucratic statism and social conformity demonstrated by Watergate and the War in Vietnam.

II. Mind and Migration: The Frankfurt School

Despite the diversity of their disciplinary training and research interests, the emigres' articles and retrospectives converge thematically around the question of vantage point in the social sciences under conditions of cultural migration. At one level there is a repeated concern with the question of research design and the position of the observer with respect to the political values of the social group or national culture in question. At another deeper level the fact of emigration itself poses the question of whether the researcher can function effectively outside of the original cultural context. The emigres in New York, as well as members of the Frankfurt School group who continued on to Los Angeles, were acutely aware that their newcomer status presented an opportunity for critical distancing and a useful comparative perspective, on the one hand, and the possibly insurmountable challenge of gaining acceptance in America for their "conceptual" approaches to the social sciences, on the other. Accommodation to the new American environment presented them with a particularly acute dilemma precisely because they were "social" scientists whose professional lives required detailed knowledge of, if not cooptation by, their new cultural context.

Hans Speier presents a fairly positive view of intellectual migration in his contribution to a 1937 symposium on intellectual

exile sponsored, appropriately, by the New School's Social Research. "I have said much about the negative effects of nationalism upon the modern immigrant intellectual", he wrote, but these "regional" restraints can be overcome by achieving "the light of universal concepts" which can form the basis of communication between emigres and native intellectuals within and across national boundaries.

> From ancient times on we can indeed establish an affinity between an external detachment from local or historical values and a comprehension of the universality of the spirit. Detachment is necessary to recognize any truth; but it s a mental rather than a physical process...Emigration offers a chance to experience more vividly and therefore to rethink more easily the most precious truths. (1937, 327)

Surprisingly even Adorno, whose views on his American sojourn soured in retrospect, (See, 1951: Minima Moralia) would look back in 1968 and recall that,

> ...in America...I was constrained no longer to regard as natural the circumstances that had developed historically in Europe -- "not to take things for granted". My now departed friend Tillich once said that he was first de-provincialized in America; he probably had something similar in mind. In America I was liberated from a certain naive belief in culture and attained the capacity to see culture from the outside. (1968, 367)

In his memoir on the experience of exile, Franz Neumann began by observing that the "fundamental ambiguity of modern political theory is manifested by the ambiguous position of the intellectual" (1953, 9) He goes on to evaluate shifting political currents in Germany and the accommodations made by dissenting intellectuals. From his perspective, "inner emigration" is an unsatisfactory solution in most circumstances and particularly for "political Scholars" who, because they were "dealing with problems of state and society,...were-or should have been -- compelled to deal with the brutal facts of politics." Like the rest of the Frankfurt group in its early writings, Neumann understood the role of "homo politicus" to be that of an engaged scholar fighting "actively for a better, more decent system". But being forced into exile meant displacement from not only family and property, but also from the substance of scholarship and the context for engagement. (Neumann, 1953, 12-13)

His friend, Otto Kirchheimer wrote "an appreciation" for Neumann in Dissent (V4, no. 4,1957) and reminded his American audiences that the transition, though difficult, had been a successful one. At his death Neumann was "hors cadre" among political scientists. According to Kirchheimer, Neumann had always been fundamentally concerned with mass society and totalitarianism, though in recent years in America he shifted focus more to the legal and institutional phenomena rather than socio-economic and

psychological ones. Neumann was "not a mere student of politics. He remained a libertarian and increasingly skeptical socialist."

The challenge of "outside-inside" inherent in migration seemed a particularly demanding one for the German social scientists who did not accept the traditional dichotomy between the observer as scientist and as participant. An outside vantage point facilitated comparative analysis but did not address the need to engage the public policies of the new culture in order to become more effective citizens as well as researchers. Speier spoke of "universal" discourse but just as easily shifted language to defend the linkage of theoretical and applied methods. In his 1979 retrospective on Lederer's work, in fact, Speier adopted a combative tone in order to argue that "contrary to what American academics would have us believe... European social scientists...were more likely than not to be engaged --as social scientists--with projects of immediate policy relevance".(1984, 1) Lederer had been the first Dean of the Graduate Faculty of emigre scholars at the New School, as well as a much published scholar. Speier took particular umbrage at a remark made by Harold D. Lasswell,

> (who) at an early celebration of the University in Exile, in the year 1939, at which Charles Beard and Thomas Mann...gave speeches...startled the listeners with a remark about the quality of intellectual accomplishments in exile. He believed that technical proficiency was diminished by emigration and spoke of the danger of 'skill deterioration". (1984, 17)

German social scientists who achieved prominence in America had already been engaged in the positivism vs. metaphysics dispute in the German academy. Upon arrival they encountered a comparable argument in America between those who identified with empirical and behavioral methodologies in the social sciences and those favoring philosophical or "normative" approaches. At the same time, the aesthetics of modernism was in full sway in the arts. In the decades after World War II these divisions would be institutionalized in professional literature, hiring practices and policy linkages between academe and Washington. What the emigres found upon arrival in the 1930's were early skirmishes in what was to be a major academic war. It seemed clear to them, however, that the war in America had already been won by the "scientism". .

It was the beginning of a cultural shift which Schlesinger's later statement articulated in more dramatic, ideological prose. The American liberal consensus was to be reinforced by incremental reform and political coalition-building rather than threatened by revolutionary paradigms not grounded in "pragmatic" realism. Reconfiguring the American consensus was a policy actively pursued in the arts as well. In the 1940's scientism in the academy found a parallel mode in the critically acclaimed rise of the New York school of abstract expressionism in art and the modernist aesthetic in literature. Organizations such as the Congress for Cultural Freedom and its American counterpart gave public validation to the "American" consensus, as well as providing a

conduit for CIA funds. Individual expression in the production of art, literature and other cultural artifacts, group behavioral studies, and historical studies of America's past, were safer paths to the rediscovery of national unity than controversial depictions of gender, race and class. (See, for example, on the ideology of Federal Arts Projects in the New Deal, Melosh, 1991. Engendering Culture.)

In the 1920's and 30's German context, Fritz Stern's The Failure of Illiberalism, (1955) argues the point that German high culture during the Weimar years was pointedly apolitical and hostile to those pragmatic, technological and democratic values which were denigrated as "American". He cites Thomas Mann, another future emigre, who wrote in Bertrachtungen eines Unpolitischen that,

> ... the difference between spirit and politics subsumes the difference between culture and civilization, between soul and society, freedom and suffrage, art and literature; and culture, soul, freedom art -- that is Germanism; and not civilization, society, suffrage and literature. (Stern, 1955, 21-22)

But it was precisely over the need to have spirit inform politics, at least in the sense of grounding empiricism in a critical research paradigm, that the emigres were most united. Stern does not explore the phenomenon of intellectual emigration from Nazi Germany but prefers instead the imagery of "internal emigration", a "retirement within the self", which he says was the already well-established mode of German intellectuals during the Weimar years. He argues that intellectuals were so alienated by the "Americanization of German culture" (Stern, 25) that they turned their back on its parallel construction of democratic institutions. Stern concludes "a few were incarcerated, some emigrated, some joined the movement, many retired to the unpolitical sphere." (Stern, 24)

But whether Americanization through emigration was voluntary or forced by Jewish heritage, those who left did not exactly fit the passive profile of Stern's hidden intellectuals nor did they display a hostility to American culture in general. Their skepticism about social "scientism" originated in German academic debate. It's designation as American was an effect not a cause of their critical stance. In fact, those who actually migrated to America not only changed territorial and cultural venues but understood that they were simultaneously engaged in an intellectual "sea change" which would reorient their previous professional and personal lives. In New York the emigres encountered their own alien natures reflected in the mirror a closed intellectual community. This distancing effect was compounded by the New Yorkers' own posture of "radical", "elitist" alienation from the "Middletown" of American culture so minutely analyzed and caricatured by the art of the day.

Translated to an academic idiom, the emigre social scientists experienced first-hand the problem of whether their conceptualized "science" of experience -- "critical theory", the "existenz" -- could be authenticated in America. Horkheimer's Institute for

Social Research was already in methodological transition two years before it was moved to New York. The shift, however, was not in the "American" direction. In his 1931 inaugural address as Director in Germany, Horkheimer had announced that he would expand the Institute's agenda to include "social philosophy" (later called "critical theory"). Adorno, Marcuse and Neumann intended their new approach as a dialectical solution to the problem of dualism in the social sciences. Neither "Scientism" nor "Metaphysics" were the appropriate approaches to social research. Instead dialectical theory would "integrate the empirical constituents into structures of experience..." (Critical Theory, 161-62)

In subsequent essays written in America during the'30's and 40's Horkheimer elaborated upon his foundational theme, but to a select audience of academic social scientists in Europe and America. Important essays, such as "The Latest Attack on Metaphysics", and "Traditional and Critical Theory" were available primarily in Zeitschrift fur Sozialforschung in the 30's and later, in English, in Studies in Philosophy and Social Science. Unlike the Social Research group of emigres, or even their own colleagues Kirchheimer, Neumann and Marcuse who easily entered the mainstream of American academic disciplines, Horkheimer and Adorno's audiences were more specialized. Adorno would be first known in America for his work with Karl Lazarsfeld. Later he published another influential collaborative study, The Authoritarian Personality, in 1950 just after he and Horkheimer returned to Germany. (Critical Theory, p. xii; Bottomore, 1984, 1-25; Gross, 1979; Hughes, 1975, 134-188; Hughes, 1983, 11-122)

But even though Horkheimer's 1930's essays were not aimed at general intellectual audiences they are useful in establishing the scope and limits of intellectual migration. Though the theory-practice debate was very much in the air on both sides of the Atlantic, Horkheimer and his colleagues would couch their critique of crude empiricism in the cloaking device of a retrospective inquiry into the origins of totalitarianism -- a generally designated evil. Accordingly, Horkheimer does credit modern positivism in Germany with an early attack on "organicist theories of state and society" and acknowledges its attractiveness in Europe and America for those opposed to fascism.

> ...the younger generation, searching for intellectual weapons against the totalitarian frenzy, attaches itself to the glorious past of this philosophy (empiricism), especially in the universities, where it has established itself as the most thorough-going antimetaphysical school. And yet this philosophy in its present form is as securely bound as metaphysics to the established order. Though its relation to the existence of the authoritarian state may not seem obvious as first, nevertheless it can be discovered easily. Neoromantic metaphysics and radical positivism alike have their roots in the present sad state of the middle class (which has) ...thrown itself into the arms of the economic leaders of the bourgeoisie. (Critical Theory, 1986, 139)

Anti-bourgeois modes of discourse were as indigenous to the American intellectual community of the 1930's as to the European Left. (Webster, 1979, 225-32) However, New York partisan lines were reforming around the perceived threat of "anti-democratic" European influences and produced, in reaction, a reaffirmation of the classical liberal democratic ethos of the American Founding era. After her arrival, Arendt found a way to maintain her hostility to bourgeois culture while celebrating the republican spirit of the Federalist "founders". She urged her "radical" American colleagues, notably Irving Howe, to do the same.

The Frankfurt group reiterated its central theme of mass culture as the degenerative form of liberal democracy and a precursor of totalitarianism. They suggested that empirical techniques in the social sciences had the effect of removing liberal institutions from the field of inquiry by assuming them to be foundational. That an unreflective social science might inadvertently facilitate the rise of totalitarian social and political institutions by ignoring real social problems was the central subtext of the group's methodological preoccupations, though references to America were rarely direct. For example, in the formal manifesto of the Frankfurt group, written by Horkheimer in 1937 ("Traditional and Critical Theory") he reiterated that critical thinking,

> is motivated today by the effort really to transcend the tension (between facts and concepts) and to abolish the difference between the individual's purposefulness, spontaneity and rationality, and those work-process relationships on which society is built. (Critical, 210)

At the same time his American counterparts in literary circles struggled with an equivalent debate over realistic (socialist or regionalist) art and modernist expressions. One result among the community of the "little journals" was a formal break between the Partisan Review and the Communist Party in 1937 over the issue of the autonomy of literary and artistic aesthetics. The Americans chose conceptual art, by and large, and tried to Americanize it for domestic consumption. (Cooney, 1986)

The Germans appeared on the scene in media res with their social "philosophy". Whether or not Wrong is right about this rupture being "the act of foundation ... that brought into being the new York intellectuals as a distinctive cultural and social formation", (Wrong, 1987) the fact of parallel but not identical critical stances in the American cultural debate is decisive for establishing the context and resonance of the German approach in America. Looking backward at German influence in a less than enthusiastic mood in 1989, Daniel Bell discusses the danger to "civil society" which was posed by the "scarlet thread" of romanticism running through German thought. "In the social sciences it has given us the simplicities of the Gemeinschaft/Gesellschaft dichotomy." Even worse, "in philosophy and politics it has given us the view, embodied in Martin Heidegger's allegiance to the Nazis of a heroic Volkstrum and Statstrum" set against bourgeois society. (Bell, 1989, 56)

This assessment was borrowed later on by Thomas Pangle in his direct attack on what he deemed Arendt's un-American existenz. (see below) Clearly, working in the midst of an emerging "American" ideology, the challenge to emigre social scientists was to find common ground between descriptive, data-based studies of the American experience, "historical" celebrations of American exceptionalism and existential or other paradigms designed by and for Europeans. A marriage of appropriate form and substance might, from the German perspective, raise the general conceptual quality of American research while helping the emigres to insert themselves usefully into the mainstream of American culture. It might also provide the vocabulary and perspective with which to buttress an American romantic rediscovery of its founding tradition.

In the early years, both Adorno and Horkheimer toned down their overt critiques of middle class culture (See for evaluations of the Institute in America : Hughes, 1975; Jay, 1985; Jackman and Borden, 1983; Heilbut, 1983) The rightward drift of their vantage point became even more pronounced, in fact, upon their return to Germany. Speier defended the policy relevance of emigre research but did not discuss actual political engagement in America. Indeed, while critical theory proposed abolishing the artificial distinction between the social scientist as detached observer and as active citizen the actual record of Adorno's and Horkheimer's role in America would seem to reinforce rather than challenge the American pattern of liberal consensus. Martin Jay, in The Dialectical Imagination (1973, 294), calls the Frankfurt emigres "mandarins" who reproduced in America a style of cultural elitism already noted in Germany by Fritz Ringer (1969) in The Decline of The German Mandarins. Tom Bottomore's study of the Frankfurt School makes the same argument, noting the irony of the fact that despite their accusation that "scientism" in America was associated with political conservatism or, at best, indifference to political life, "...with the exception of Marcuse no leading member of the Frankfurt School took any active part in or gave support to a radical political movement." (1984,34).

Their major American study, The Authoritarian Personality, did become a classic of its kind and provoked a respectful though critical book of commentary by American "empiricist" critics. (See: R. Christie et. al., 1954. Studies in the Scope and Methods of the "Authoritarian Personality") However, even though the sample was American and the findings indicated a distinct "fascist potential" (975), its conclusions were confined to "psychological totalitarianism" (632). The Institute and Berkeley teams combined survey research methodology with a conceptual framework centering on social-psychological typologies of democratic and authoritarian tendencies. ("F Scale") The focus was almost exclusively "ethnocentrism", understood as anti-Semitism, and their conclusion explicitly limited itself to the level of individual therapeutical issues. On the one hand they noted that proto-fascist personalities are produced by the "total organization of society" and will only change when it does. On the other hand, Adorno says that even if psychologists participate in the "councils or round tables" where social scientists have input to national

policy-making the efficacy of laws in altering behavior is probably minimal.

> The problem is one which requires the efforts of all social scientists. All that we would insist upon is that in the councils or round tables where the problem is considered and action planned the psychologist should have a voice. We believe that the scientific understanding of society must include an understanding of what it does to people and that it is possible to have social reforms...which though desirable in their own right would not necessarily change the structure of the prejudiced personality. (Adorno, 1950, 975)

In The Sea Change (1975), H. Stuart Hughes argues that the Authoritarian Personality was marred by an incomplete merging of American and German modes of discourse. The juxtaposition of "democratic" as the antithesis to "fascist" was a American. Germans "would more likely have spoken of 'socialist' or 'revolutionary'" as the opposing principles. Hughes also speculates that Horkheimer's transition from German to English may have had the unanticipated effect of toning down the polemical force of his prose. (153)

Then, too, there may also have been some intentional modification of his 1947 essay, "Eclipse of Reason" based on lectures at Columbia three years earlier. Fielding a mild critique of liberal culture, Horkheimer invoked the popular theme of liberalism's fatal inability to defend itself. He took aim at the weakness of liberalism in "determining the desirability of any goal" and included a critique of pragmatism as the indigenous variant of positivism. (cited in Hughes, 154) Dewey's ideas, though well-intentioned in the American democratic context, had the effect of elevating science to a 'censorial power" and were the intellectual counterpart of "modern industrialism". Hokheimer argued that the defense of a free society required open-mindedness. Without it liberalism was in danger of "tilt(ing) over into fascism". (154)

Not all the Frankfurt refugees followed a similar pattern. Marcuse and Neumann diverged significantly, especially once the Institute's prime movers decamped to Los Angeles. Franz Neumann's Behemoth was another highly visible emigre product and remained so even though its interpretation of fascism as the highest state of capitalist development was certainly not a mainstream thesis for general American audiences. However, Neumann was not engaged in the analysis of a specifically American evolution toward mass phenomena, as his use of the term "Behemoth" made clear to academic political scientists. When discussing American culture in lectures, later published posthumously as The Democratic and Authoritarian State (1957), Neumann carefully referenced the problem of conformity but always placed American-style constitutionalism and individual rights at the foreground. As the Frankfurt school itself evolved toward cultural critique, their colleague Neumann was in transit from Behemoth's more directly Marxist methodology to one that focused on political and psychological structures as well as economic laws. Moving from

base to superstructure, from social realism to aesthetic consciousness, they encountered their American intellectual counterparts en route.

However, the impact of migration on critical vantage point was exacerbated for many of the exiles by continental drift. A second diaspora occurred as the Frankfurt group left the cosmopolitan haven of New York for Berkeley and Los Angeles in the 1940's and officially moved institutional addresses. Marcuse and Neumann went to Washington to work for the O.S.S and never re-established their previous close connections with the Frankfurt School's remaining members. Mike Davis' devastating study of Los Angeles, City of Quartz, alludes briefly to the sentiment of suspension between worlds and between cities which beset the LA emigres (including in his analysis the other eminent emigres literature and the arts), which this study is attempting to capture in the context of New York.

> ...the relationship between the city and the community of anti-fascist exiles deserves separate consideration. It was a potent common moment in the cultural histories of Southern California and Europe .... The exile sense of Los Angeles was unremittingly pessimistic. Here was the ultimate city of capital, lustrous and superficial, negating eery classical value of European urbanity. Driven by one epochal defeat of the Enlightenment to the shores of Santa Monica Bay, the most unhappy of the exiles thought they discerned a second defeat in Los Angeles as the 'shape of things to come', a mirror of capitalism's future. (Davis, 21)

Long after returning to Germany, Adorno struggled to come to terms with his social scientific endeavors and cultural adjustment in Los Angeles. In "Scientific Experiences of A European Scholar in America" in 1968 (Perspectives in American History, V.2, 338-370) Adorno revisits the terrain of contextual displacement and intellectual change. America had done him the favor of bringing the importance of "culture" to the forefront of his research rather than allowing it to remain in the background as an assumed subtext. "In America I was liberated from a certain naive belief in culture and attained the capacity to see culture from the outside." Adorno realized that,

> In spite of all the social criticism and all consciousness of the primacy of economic factors, the fundamental importance of the mind - Geist - was a quasi-dogma self-evident to me from the very beginning. The fact that this was not a foregone conclusion I learned in America where no reverential silence in the presence of everything intellectual prevailed as it did in Central and Western Europe. (Adorno, 367)

One of Adorno's retrospective looks at America, (much more positive than Minima Moralia.) returns to the problem of the intellectual in both American popular culture and academic methodology. "Obviously", he wrote, it is "very difficult" in America to understand that "anything intellectual" is objective. "The intellect is unconditionally equated with the subject who

bears it", and not with the "independence and autonomy" of its thought products. Citing Max Weber, he discusses the "opposition between the expert technician and the European 'intellectual', the 'gebildete Mensch'" (350). However, Adorno's analyses of the sociology of music and American culture were not based on Weberian ideal types juxtaposed to social chaos. A number of the German emigres were influenced by Weber but, as Speier noted in his eulogy for Lederer in 1984, they "took exception to Max Weber's notion of the world as devoid of a unifying meaning." To Lederer in Germany in 1925, that path led straight from idealism to nihilism. (Speier, 1984, 3)

In fact, Adorno's observations on "society" and its dangers to both individual consciousness and collective culture took the opposite view from Weber's and sounded a theme common to a number of the emigres, regardless of their academic mentoring. The problem was the elimination of complexity in civil society and the substitution of totalizing, intrusive institutions. There was considerable debate as to whether these totalitarian trends originated in State or civil society but the consensus was, as Adorno articulated it, that "in contemporary society the objective institutions and trends of development have achieved a dominance over individuals". (See also: Lederer, 1940; Salomon, 1946; Kelsen, 1948; Strauss, 1949; Kirchheimer, 1957; Jonas, 1959; Morganthau, 1971). That the intellectual in America had no assured place in public discourse or in social status is a theme noted repeatedly by the emigres. Their emphases on "plurality", "stratification" and other terms for multiple social roles and identifications were intended to counter the inherent totalitarianism. Key terms which the emigres employed to evoke the danger were: "the threat of conformism", (Arendt, 1954), "patternization" (Tillich, 1957) "epistemological totalitarianism." (Kelsen, 1948).

About the dangers of social conformism Arendt was in total agreement. But even in the 1960's Arendt could still write in glowing terms about American "freedom" at the Founding from the "necessity" of socioeconomic laws and the Republic's continuing "tradition" of political equality and social diversity. Her approach, reminiscent of Strauss', looked to the novus ordo saeculorum as a particularly fortunate exercise in foundation because it occurred in the absence of class conflict and thus, unlike the French and Russian revolutions, was an entirely political phenomenon.

> What were absent from the American scene were misery and want rather than poverty...the laborious in America were poor but not miserable...they were not driven by want and the revolution was not overwhelmed by them. The problem they posed was not social but political, it concerned not the order of society but the form of government. (1963, 63)

America's modernity was exceptional, argued Arendt, because it avoided not only Europe's "social question" but also the radical theories of revolution which had opened the pandora's box of "necessity". Robespierre attempted to found a republic but his

effort was "stillborn". The existence of abject poverty in France, and in 20th century Russia, placed the founding of public spheres "under the absolute dictate" of the need to achieve a modicum of material happiness. Arendt would argue the absolute separation of "freedom", defined as public action, from "happiness" understood as fulfilling the material needs of the multitude. The "transformation of the Rights of man into the rights of the Sans-Culottes" reduced political freedom to social justice in Europe. America, by her standards, was the only authentically political revolution because it avoided the degeneration of political consciousness -- even though the American Revolution was the least appreciated by Europeans. (1963. 15-18)

The Frankfurt perspective was not, in this respect, her own. Indeed, Arendt had little sympathy for the Institute for Social Research or its team of exiles on both coasts and was a lifelong critic of the "social sciences" in any guise whether in America or in Europe. In her essay "Tradition and the Modern Age", Arendt railed at "socialized men" and the "ubiquitous functionalization of modern society" which had reduced the capacity to "wonder at that which is as it is" to a calculation of social values (1961, Between Past and Future, 39-40) Unlike her colleagues, however, Arendt equated all social science methodology as practiced in the academy with crude empiricism. She heaped abuse on the "profound nonsense of the new 'value-free' science which was soon to degenerate into 'scientism'". (1961, 34)

Arendt also had no interest in endorsing critical theory as a viable approach to the crisis of modernity and was, in fact, hostile to both its progenitors and its substance. (Young-Bruehl, 1982, 80) She did not discuss critical theory directly in her works but instead dismissed the movement's progenitors, Hegel and Marx, as flawed "radicals" who tried to totalize theory and practice, and ended by devaluing both. (1968, 22-40) In addition, Arendt had personal reasons for disliking Adorno and Horkheimer. Adorno, while still in Frankfurt, had negatively critiqued her first husband's doctoral thesis on the philosophy of music. She also believed for many years that the Frankfurt group's delay in obtaining a visa for her close friend Walter Benjamin had contributed to his suicide. She never abandoned the grievance that they had not published some of his best work quickly enough. (Heilbut, 405-406) Arendt's less than sympathetic attitude to another emigre community than her own might best be captured through Georg Lukacs' stinging observations that,

> ...many of the leading German intellectuals, including Adorno, have installed themselves in this "Grand Hotel Abyss" which I have described elsewhere in connection with Schopenhauer: "It is a hotel provided with every modern comfort, but resting on the edge of the abyss, of nothingness, of the absurd. The daily contemplation of the abyss, in between excellent meals and artistic entertainments, can only enhance the residents' enjoyment of this superlative comfort." (cited in Bottomore, 1984, 34)

The canvas upon which the emigres painted their self-portraits was the broad American terrain of social science's "everyman" as well as the elite sub-culture of urban intellectuals in literary journals and universities. Though American cultural histories such as those by Davis, Schwartz and Doss, provide texture and nuance specific to particular contexts, such as Los Angeles or New York, they miss the complexity of the American-emigre interpenetration. For example, Davis' applies Marxist sociology to his theme of economic class and cultural stratification in the non-city of Los Angeles. Moreover, his methodology is one which many of the emigres themselves modified or discarded as a result of their frustration with the resistance of American politics and society to either Marxist analysis or transformation. Of course for Davis the social sciences in general, and the exiles in particular, are not at the center of his noir snapshot of American culture in the 30's and 40's. Just as political discourse is the context but not the central dialogue in the Doss and Schwartz studies of the ideological use of American culture.

II. Heidegger's Fifth Column

Another overlapping circle of emigres, including among others Arendt, Kirchheimer, Marcuse, Jonas and Kristeller, were all students of Martin Heidegger from the middle to late 1920's Arendt, Kristeller and Jonas were among the few Jews in Bultmann's classes on Christian philosophy and Heidegger's on the new phenomenology of Being. They attended the lectures which became Sein Und Zeit, and all wrote doctoral dissertations on religious philosophy. Though they disagreed with each other on a number of political and methodological issues, they also shared a fascination with the role and nature of religious "tradition" in conditions of modernity. In their mature writings secularized forms of theological disputation appeared as attempts to overcome the opposition between experience and cognition, public opinion and the role of the intellectual, historical events and the "crisis" of Western tradition. At this juncture the Heidegger cohort overlapped that of the Frankfurt and Social Democratic emigrés.

In a tribute to Arendt written for Political Theory, Feb., 1976) her admirer and fellow emigre, Hans Morgenthau, wondered "from what philosophic and political point of view did Hannah Arendt approached the disparate topics of her investigations?" Indeed, the question of point of reference was always at issue both for her and for the others who seemed to write from a position well within, but not quite "of" the worlds of American academic and literary discourse. His question was mostly rhetorical and he answered it himself by immediately eliminating the obvious. He felt certain that although she had studied with Heidegger and Jaspers, "one would have to search very carefully for direct influences traceable to these two giants..."

Yet for others the debt to Heidegger was damning. Thomas Pangle is intent upon disconnecting one eminent emigre from another --that is, Strauss whom he venerates from Arendt whom he castigates (though the former proposed marriage to the latter). Writing from the perspective of the "Straussian" school of political thought in

The Spirit of Modern Republicanism (1988), Thomas Pangle attacks Arendt as a Heideggerean mole sent to undermine the tradition of political thought with the corrosive effects of German nihilism. She was one of the "many thoughtful men and women" of her time who were disturbed by "the growth of 'individualism' (and) the feebleness of civic pride..." (48), writes Pangle. But she and her mentors reacted with an equally dangerous "nostalgic pining for a heroic, communitarian ancestry" which "encouraged a moral rebellion" against the "bourgeois liberalism" which, Pangle argues, "defines" the Western republican tradition. Pangle ascribes a mesmerizing effect to Arendt's intellectual presence, which has made her,

> perhaps the most serious intellectual source of these longings. J.G.A. Pocock and his students make it clear that while some of their key methodological assumptions may derive from Wittgenstein, Kuhn or Geertz, the animating moral inspiration for their writings comes from Arendt.

Pangle fears that Pocock, John Diggins and others on both sides of the Atlantic have missed the eminence noire cleverly concealed behind her celebrations of the "lost treasure" of polis life. In truth, says Pangle, "Arendt was the popularizer in America of Heidegger's political broodings." (49) Her intention from the beginning of her career was to "effect a rupture with the entire Western tradition", especially the "relation between reason and action". (49) As a Heideggerean fellow traveler, Arendt pursued an "esoteric" methodology of concealed meanings.

> She rarely conveyed her enormous debt to Heidegger, and her humanity compelled her to shrink back, in understandable inconsistency and wavering obfuscation, from the most radical implications of her mentor's new thinking. But she in effect endowed a watered-down version of Heideggerian political thought with an allure that it previously lacked altogether in the Anglo-American world. (49)

And Heidegger was not the only bad company she kept. Arendt is also accused of a penchant for Machiavelli, Robespierre and Lenin as evidenced by her enthusiasm for "resoluteness" and "decision".

Pangle's Heideggerean, proto-fascist, vision of Arendt is a late Cold War polemic with a not-so-esoteric agenda of its own. It raises the issue of academic culture clash and compounds its effect by the overt charge of un-American philosophical activities. Finally, it is clearly wrong. If one makes the effort to penetrate any of Arendt's works it is hard to avoid her critiques of Rousseau, Nietzsche, Hegel and Marx -- and even Heidegger. A more accurate, but opposite commentary on the German emigre community in exile is John Gunnell's. In Between Philosophy and Politics: The Alienation of Political Theory (1986: Amherst: Univ. of Mass.) Gunnell takes the Heidegger-emigre linkage as a given, but ascribes to it a rather different effect --though no less negative from Gunnell's perspective.

Gunnell lumps the emigres together in a uniform crisis mentalite. Rather than being guilty of defending "moral relativism" and "nihilism", Gunnell argues that Arendt and the German academics, including Leo Strauss, defended the morality of political life and the possibility of "normative" political thought by rejecting actual politics.

> Although Arendt does not place as much pointed emphasis on the dilemma of relativism and the need to recover absolute values as Strauss and Voegelin do, relativism is a principal aspect of her analysis of world alienation ... Modern philosophy and modern science are, Arendt claims, founded on 'Cartesian doubt' and have contributed to 'modern nihilism'. (111)

Presenting the exact obverse of Pangle's analysis, Gunnell cites Arendt's lament over the decline of the ability "to think in universal, absolute terms" because the idea of a "transcendent world disappears". Instead of "Being we now find the concept of process." The life of the mind loses its "for its own sake" status and becomes instrumental to other ends on "the assumption that life, and not the world, is the highest good of man." (cited in Gunnell, pp. 99-118).

What is missing from Pangel's and Gunnell's versions of the "Grand Hotel Abyss", is Arendt's paradigm of the vita activa which was characteristic of many of the emigres' efforts to close, rather than widen, the gap between history and thought. Not a single emigre in the sample celebrated totality as a normative model for State or civil society. With the exception of Strauss and Voegelin, even critiques of "scientism" were not undertaken in the interests of thoroughgoing anti-modernism. Jewish religious affiliation or ideological commitment to liberalism were less important factors than their pragmatic interest in making the public world safe for themselves and other "radical" intellectuals. That America was, in constitutional theory at least, a safe haven for personal rights as well as democratic values was compelling cause for emigration and efforts to become engaged in American culture.

Arendt resisted all attempts to cast her in Pangle's stereotype, including charges by Henry Fairlie (New York Times, Dec. 31, 1973) that the emigres had undermined native American "trust in the common people." This time her bad company was identified as not only other "Weimar intellectuals" but also the political science community. The latter stood accused of shifting focus from the "opportunities and the promise of self-government" to legitimating "elites that would stand in opposition to the 'authoritarian personality' of the 'masses'. The latter references were aimed directly at the emigres who, by implication, exerted their baleful influence on the discipline and also on the "political mind of America". The main "fiction" for which Arendt and her cohort stood accused was, in fact, the idea of mass society as the precursor to totalitarianism.

> The ordinary people, we have been told, are only an amorphous mass of depersonalized units with no personal individuality and no public character. This fiction was imported into the United States by a number of brilliant refugees from the Weimar Republic, including Hannah Arendt and Eric Fromm, Emil Lederer and Herbert Marcuse.

In private correspondence to a friend who alerted her to the article and asked her reaction, Arendt responded with a characteristic step away from her colleagues and from the equation of European and American masses.

> Mr. Fairlie puts me together with people with whom I have hardly anything in common except our origin (the Frankfurt School, etc.) My use of the word "masses" is strictly limited by distinguishing it from "the people"...on the one side and the "mob" on the other. In my studies of totalitarianism the masses are the result of the disintegration of the class system; Hence, I'm talking about a historical phenomenon which is unknown in the United States. It is true that I also occasionally use the term modern masses in a much more general way, and use it for America only as something which made its appearance with "mass emigration"...If I may quote from my own writings which quite obviously are unknown to Mr. Fairlie; "Theoretically, the most relevant and most pernicious among certain theories is the equation of "people" and "masses." (Library of Congress-#004672; Letter to George Ackerman, Feb. 21, 1974)

America appeared in Arendt's exitenz as the second coming of the Athenian polis. This phenomenological approach to history was distinctively Arendtian but had occasional echoes among the rest of the Heideggerean circle. For Arendt more than the others, however, the public realm of agonal political discourse was the secret to Western civilization. It was the "lost treasure" which totalitarianism had destroyed where it took hold, even before the treasure's existence was fully rediscovered. While her focus was precisely on this political realm and how it might be protected from the social realm of necessity writ large, in order to do so she had to define the pre-condition for public life as social "plurality" .

If social difference is maintained, a la Tocqueville, then the uniformity of mass democracy is forestalled. Free will in individuals is expressed in the collective public realm as the "natality" of freely willed, contingent acts of word and deed. As Arendt said in the last public speech of her life, in 1975, when she accepted the Sonning Prize for contributions to European civilization in 1975, she had become a United States citizen voluntarily,

> ...because the Republic was indeed a government of laws and not men. What I learned in these first crucial years between immigration and naturalization amounted roughly to a self-taught course in the political philosophy of

> the Founding Fathers...the freedom of becoming a citizen without having to pay the price of assimilation. I am as you know a Jew, feminini generis, as you can see...
> (Library of Congress--#013979-80; 1975)

The problem was that, like the Franfkfurt model of integrative critical theory, the "world" so constituted existed most perfectly in the consciousness of its theorists.

Pangle, Gunnell and other observers of the emigres are too often warriors in the same academic conflict over the relationship between philosophy and public life which divided and united the emigres. (See other emigres on the subject: Morgenthau, 1940, 71; Voegelin, 1945; Kelsen, 1948; Jonas, 1959.) From their vantage points on the right and left of the political science spectrum, they nonetheless agree on the significant impact of the German emigre community on American political culture. Gunnell's own agenda is to challenge the "tradition" of polarity between normative political thought and empirical political science. The suspects in his game of academic "clue" are the German emigres with their alien angst and illusions of philosophic efficacy. Like Pangle, though for very different reasons, the prime suspect is the most widely read of Heidegger's students, Hannah Arendt, even though he agrees that the record of the emigres' American works shows that common patterns of concern and vantage points, if not specific research hypotheses, bound them all.

Morgenthau, an ardent admirer and Heidegger student himself, as well as Pangle and Gunnell who are ardent critics agree that if Arendt's debt to Heidegger is considerable it is nonetheless well veiled. Other German intellectuals on the Left, such as Alfons Sollner, have taken up the cause of compiling evidence of residual proto-Nazi "decisionism" in the works of Neumann, Kirchheimer and Marcuse because they studied either with Heidegger or Carl Schmitt. (1984). Looking for ways to disparage the evidently powerful linkage between German and American modes of political discourse in the era of the Cold War students of "American" political ideas such as Pangel and Gunnell have decided they made the academy unsafe for liberalism. Even if this is true, which seems unlikely, it is ironic that their effect outside the academy may have been just the reverse.

IV. Conclusion:

Despite the divergence in their ethnic, religious, regional and disciplinary background, emigre writings beginning in the 1930's also display common themes and modes of discourse when the role of the intellectual in mass society, the question of America's exceptional status, and the relationship between empirical and normative methodologies are the direct or indirect political points of reference. A whole generation of phenomenologists, sociologists, economists, legal historians and political scientists developed evaluative paradigms for "liberal mass democracy" and for their role in its critique, both positive and negative. When transplanted into the political debate and cultural experiences of New Deal America, their "critical" perspectives stimulated the

evolution of new perspectives on the scope and nature of the American liberal consensus.

In the context of their times neither Arendt exclusively, nor the Heideggerean community broadly defined, nor the German sociologists and Frankfurt School Freudians and Marxists, nor German political scientists, can be isolated as prime movers. But, taken together, they all had a major and lasting impact on the discourse of American liberalism and were in turn transformed by it.

ENDNOTES

1. I began this project at EMU in Fall, of 1991 working initially with Karen Schaumann, then my Honors undergraduate research assistant. Today, the Emigre project consists of a number of extremely talented faculty and students: Prof. Adrian Lottie, Department of Political Science; Helen Aristar-Dry, Linguistics Section, Department of English; graduate students Karen Schaumann, Project Coordinator, and Miles McNiff; undergraduate students Claudia Dahlerus and Ann Gaynier.

2. Rediscovering Hannah Arendt: Love and Saint Augustine (with Judith Stark, Dept. of Philosophy, Seton Hall Univ.) Forthcoming from Harcourt Brace Jovanovich. I discovered the unpublished, much annotated and amended English translation of Arendt's dissertation in the Library of Congress several years ago. Close examination of her handwritten annotations and retypings, compared with the dates of her contract for publication with Crowell publishers in 1963, clearly indicated that the major revisions occurred from the late 1950's (probably 1958) through the early 1960'a (probably until 1961) when the Eichmann affair began. The revisions are directly linked to her other works in progress at the time, The Human Condition, the essays in Between Past and Future, essays in Men In Dark Times, the "Ideology and Terror" chapter in Origins of Totalitarianism, and On Revolution.

It was the vivid experience of cross-referencing concepts between the explicitly political language of her later works and the apparently theological discourse of the dissertation which convinced me of the necessity of contextual analysis. By this I mean not only the reconstruction of discourse context in order to link words and meanings across texts but also the search for "communities of intellect" among the German emigres themselves and between them and their American counterparts in the formative decades of the 1930's through 50's. As Arendt coined her canonic terms, "natality", "foundation", "plurality", "public realm" and "totalitarianism" she was reflecting and in turn influencing an intense conversation in New York. It took place across disciplines and journals and joined the New York intellectuals with their peers in Chicago, Berkeley and Washington D.C. At issue were the rights and responsibilities of the cultural elite in democratic politics and, as they saw it then, the future of Western civilization.

Derrida On Rousseau: Exemplars, Epochs, and the History of Political Thought

John T. Scott
Dartmouth College

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2–5, 1993. Copywrite by the American Political Science Association. Not to be cited or quoted without the permission of the author.

Jacques Derrida's work has exerted an enormous influence on literary criticism for some time, and more recently it has entered the discourse of legal and political theory. Derridean deconstruction may initially appear to be a method of reading texts, and as students of the texts of political thought it would warrant our attention. Deconstruction appears in this light as a strange hybrid of close textual analysis and unconstrained play. However, to understand Derrida's project in this way would be at best limited, and is in fact incorrect. Derrida's reading of philosophy is intended to be subversive. He problematizes the primary concepts of (Western) philosophy, including the arguably founding dichotomy of nature and law, physis and nomos, a dichotomy proper to political philosophy. Those of us who study political thought are challenged by Derrida to reassess our understanding of the subject and the way we study it.

Derrida's reading of Rousseau in Of Grammatology presents an opportunity to begin to assess the bearing of his project on the study of political theory. This work constitutes Derrida's most ambitious attempt to explicate his "theoretical matrix" and apply it to an "example," namely Rousseau and his "age" or "epoch."[1] This work is also a rare instance of sustained attention to a major political thinker on Derrida's part, or at least an instance which includes attention to specifically political thought.[2] The fact that political thought narrowly defined does not figure prominently in Derrida's work should not be taken as a sign of his lack of interest in politics and political theory, however, for he proclaims that his readings constitute "particular political and institutional interventions that transform contexts."[3] As an interpretation of an exemplary figure and text, Of Grammatology is itself Derrida's attempt to produce a novel exemplar, or perhaps an exemplary novel. Derridean deconstruction represents a mode of political action that is well worth investigating.[4] Nonetheless, I wish to focus here on questions pertinent to us as students of the history of political thought.

In this paper I propose to concentrate on Derrida's periodization of the history of philosophy and his treatment of Rousseau and his epoch in particular. Derrida views the course of Western thought as a grand "epoch" the "closure" of which he claims to glimpse. Despite his reservations about periodization of any sort, Derrida not only characterizes the entirety of Western thought from the pre-Socratics to Heidegger and our own time as a definable epoch, but identifies several sub-epochs within that whole. I examine the continuity and discontinuities Derrida sees in the history of philosophy. Derrida chooses Rousseau as an exemplar of both the entire epoch of Western thought and a particular epoch within it. Through a more detailed examination of Derrida's reading of Rousseau I raise questions about his characterization of philosophy and the epochs within its history. Finally, out of my examination of these subjects I isolate the different levels on which Derrida's

project might influence the study of political thought and then attempt to assess how opening these different questions might affect our understanding and study of the subject.

Derrida and the Problems of Periodization

Categorizations or periodizations of any phenomena are always problematic to some extent. They are dependent to some extent upon the assumptions and the parameters of the analysis itself, yet never perfectly match what they try to grasp. Derrida is well aware that the study of philosophy requires some sort of historical and disciplinary schema, as his own periodizations show, and he is also aware of the perils of periodization. The problems Derrida raises concerning the continuities and discontinuities within the history of philosophy are, however, more interesting. "Deconstructive discourses have sufficiently questioned, among other things, the classical assurances of history, the genealogical narrative, and periodizations of all sorts, and we can no longer ingenuously propose a tableau or a history of deconstruction."[5] Deconstruction operates as a meta-critique on the principle that it uncovers the fundamental discontinuities within any continuity. Deconstruction is implicit within philosophy throughout its "history," indeed implicit within the human condition, so any history of philosophy or of deconstruction is problematic as such.

Derrida's tries to reconcile the recognition of both fundamental continuity and discontinuities within the "history" of philosophy. The discontinuities are perhaps more obvious. Philosophy is not a developing history in the sense of a progression. "We must avoid the temptation of supposing that what occurs today somehow pre-existed in a latent form, waiting to be unfolded or explicated. Such thinking also conceives history as an evolutionary development and excludes the crucial notions of rupture and mutation in history."[6] The ruptures and mutations in history show that philosophy is not a simple unfolding of meaning.

Derrida challenges Hegel's dialectical philosophy of history and the history of philosophy, or any similar theory. However, Derrida also affirms a certain continuity within the history of the West and Western philosophy based upon a certain structural or "economical" basis of Western thought that Derrida views as a more general form of Hegelianism, decisively modified by the phenomenology of Husserl and Heidegger and by structuralism, within which Hegel operates as a restricted example.[7]

The discontinuities within the course of philosophy, both apparently gradual changes and ruptures, represent movements among alternatives within the structure or economy of Western philosophy as a whole. Derrida therefore claims that what appears very new "has in fact an essential connection with something extremely old which has been covered over (archi-disimulé). So that the new is not so much what occurs for the first time but that 'very ancient' dimension which recurs in the 'very modern'; and which has been signified repetitively throughout our historical tradition, in Greece and Rome, in Plato and in Descartes and in Kant, etc."[8]

There is a phenomenon of "repetition" in philosophy and Derrida's reading of Western thought is an attempt to define the principle of that repetition as a sign of both continuity and rupture.

> On the one hand we affirm the existence of ruptures in history, and on the other we affirm that these ruptures produce gaps or faults (failles) in which the most hidden and forgotten archives can emerge and constantly recur and work through history. One must surmount the categorical oppositions of philosophical logic out of fidelity to these conflicting positions of historical discontinuity (rupture) and continuity

> (repetition), which are neither a pure break with the past nor a pure unfolding or explication of it.[9]

In an essay on Rousseau Derrida similarly pronounces himself "concerned, rather, with discerning the repetition or permanence, at a profound level of discourse, of certain fundamental schemes and of certain directive concepts." He also states in this question that his concern is to open "certain questions too about a certain closure of concepts."[10] His reasons for examining one epoch and exemplar within the history of philosophy in Of Grammatology, and the stakes of that reading, make sense only within the context of his conception of the continuity of those fundamental schemes.

Continuity: Phonocentrism and Logocentrism

Derrida pursues and mines an extraordinary range of texts, philosophical as well literary, but his ultimate quarry is the entirety of Western thought. He claims that all discourses or texts, and he takes these terms both narrowly and very broadly, have a similar feature that gives them their structure as well as allows that structure to be deconstructed: they all exhibit a logocentrism particular to Western metaphysics and a broader phonocentrism. Logocentric phonocentrism provides the principle of continuity within Western philosophy. Because he knows its ways, Derrida is always ahead of his quarry, waiting to snare and undermine it.

Derrida's attention is concentrated on philosophy in an important respect, despite his rejection of the distinction between philosophical and non-philosophical texts. Even so-called non-philosophical works "still belong to Western culture and so are never totally free from the marks of philosophic language"[11] and "whoever alleges that philosophical discourse belongs to the closure of a language must still proceed within this language and with the oppositions it furnishes."[12] Philosophy is the primary locus, if not source, of the language Derrida means to deconstruct. His project involves attending to the tracks of philosophic language while at the same time seeking to move beyond them. "My central question is: from what site or non-site (non-lieu) can philosophy as such appear to itself as other than itself, so that it can interrogate and reflect upon itself in an original manner?"[13] The phonocentric foundation of logocentric philosophy serves as the Archimedean point from which Derrida will deconstruct philosophy.[14]

Phonocentrism

Phonocentrism involves a privileging of the "phonè" or voice as the immediate expression of meaning. "The ideal of perfect self-presence, of the immediate possession of meaning, is what is expressed by the phonocentric necessity." Through voice speaker and listener are supposed to be immediately present to one another, a relationship subverted by writing.[15] Speech involves the production of signs. These signs are viewed as having an immediate relationship with the voice and through the voice to what is signified. Writing in this system appears as supplementary, conventional, or even arbitrary sign of a sign, and a falling away from immediate meaning. Derrida cites Aristotle as the classical exemplar in the logocentric version of this phonocentrism: "spoken words (ta en tê phonê) are symbols of mental experience (pathêmata tes [sic] psychês) and written words are the symbols of spoken words" (p. 11).[16]

The privileging of the voice, Derrida explains, "does not depend upon a choice that could have been avoided" (p. 7). He appears to view phonocentrism as essential to humans as speaking beings. Man is not the zôon logon echon, as Aristotle argued, but the zôon phonên

echon.[17] How Derrida understands the relationship between phoné as passionate expression, which Aristotle says man has in common with the animals, and logos as intentional, significant speech with respect to human beings is unclear.[18] In any case, Derrida's understanding of what might be called the linguistic condition of man underlies his theory as a whole and his deconstruction of Western metaphysics.

Derrida's deconstruction of language and its concepts involves undermining the supposedly immediate and univocal relationship of sign and signifier. He notes that "the phonic element, the term, the plenitude that is called sensible, would not appear as such without the difference or opposition which gives them form" (p. 62). Linguistic systems rely upon a process of differentiation or articulation. The term "articulation" is seized upon by Derrida because of its double connotation: referring to articulation in speech and the associated process of discrimination it involves. Language inscribes differences as it attempts to articulate the world. "By definition, difference is never in itself a sensible plenitude. Therefore, its necessity contradicts the allegation of a naturally phonic essence of language" (p. 53). Voice already contains articulation; univocity is compromised not as a loss of presence, but from the outset. Phonocentric economies deconstruct themselves or are deconstructable because the articulations within them are always unstable, even violent. Derrida defines "writing" as "all that gives rise to an inscription in general" (p. 9). This is the sense, then, in which we are to understand his paradoxical claim that writing precedes speaking and his use of "grammatology" as the global science.[19]

Phonocentrism produces a linguistic structure or "economy" that is already a falling away from the supposed source of meaning in presence, that is already "writing" in being articulated and in assuming the absence of the (speaking) subject. Phonocentrism necessarily "responds to a moment of economy"— "le système de s'entendre-parler" (pp. 7–8; Fr., p. 17). Norris explains that "s'entendre-parler might thus be translated: 'hearing oneself speak and immediately grasping the sense of one's own utterance."[20] Hence the visualization of Derrida's double-entendre in Spivak's translation: "hearing (understanding)-oneself-speak."

Derrida's use of the terms "economy" to describe phonocentrism, as well as logocentrism, is significant. He argues, especially in his critical analysis of Husserlian phenomenology in Speech and Phenomena, that voice always assumes an "other" (or "another") in addition to "one's self" (or "oneself"). The phonocentric "economy" or "system" is a structure that produces the subject, others, and the world and our understanding of them. "Difference" is the necessary byproduct of the attempt to secure presence as what is present here, or as the principle of identity and non-identity. The attempt to "defer" absence, especially the absence of death (see p. 69) and secure what is present now is similarly central. The spatio-temporal exigencies of our existence result in what Derrida terms "differance"(différance), a neologism combining the senses of both "difference" and "deferring."[21] "This economic aspect of differance . . . confirms that the subject, and first of all the conscious and speaking subject, depends upon the system of differences and the movement of differance, that the subject is constituted only in being divided from itself, in becoming space, in temporizing, in deferral."[22] More strongly: "This movement of differance is not something that happens to a transcendental subject; it produces a subject."[23] Differance actually produces our spatio-temporal experience (p. 65), including the spatio-temporal text. Derrida thus produces what he calls the "axial proposition" of Of Grammatology: "There is nothing outside of the text"— "Il n'y a pas de hors-texte" (pp. 158, 163).

Differance is "an economical concept designating the production of differing/deferring." As "arche-writing" differance in some sense precedes all (vocal) language, but is not to be

thought of as itself an originary or transcendental concept: "Differance by itself would be more 'originary,' but one would no longer be able to call it 'origin' or 'ground,' those notions belonging essentially to the history of onto-theology, to the system functioning as the effacement of differance" (p. 23; see p. 56). Despite a system's attempt to efface differance within its particular economy, the arche-writing of differance leaves its "trace" or a chain of "supplements" to which Derrida attends in his deconstructive readings of texts so infected by phonocentrism as well as logocentrism. The movement of differance or the trace is both the condition of (articulated, differentiated) meaning and its subversion. "It permits the articulation of speech and writing— in the colloquial sense— as it founds the metaphysical opposition between the sensible and the intelligible, then between the signifier and the signified, expression and content, etc. If language were not already, in that sense, a writing, . . . the classical problem of relationships between speech and writing could not arise" (p. 63). No economy or structure within the controlling phonocentrism, or logocentrism, can dominate or exhaust the possibilities of phonocentrism because of the differance that produces as well as disrupts the structure.

Derrida does not conceive deconstruction simply as a challenge from without, but as a "dislocation" necessarily befalling the text— texts of philosophy or otherwise, texts narrowly or very broadly understood— from within because of its structural character. Since deconstruction befalls texts themselves, Derrida does not view his reading as a "method," for it is in essence a challenge to the idea of method (itself a logocentric concept). He does however recognize the tendency of his theory like others to sediment and be used as a doctrinaire method of "deconstructionism."[24] The phrase "deconstruction of Western metaphysics" should therefore be read with the double meaning of the genitive in mind.

Since phonocentrism appears to be endemic to the human condition, the deconstruction that accompanies its structural character allows for a general cultural critique, of which Derrida's deconstruction of Western logocentrism is one species. "Every culture and society requires an internal critique or deconstruction as an essential part of its development. A priori, we can presume that non-European cultures operate some sort of autocritique of their own linguistic concepts and foundational institutions. Every culture needs an element of self-interrogation and of distance from itself, if it is to transform itself. No culture is closed in on itself."[25]

In the West, phonocentrism merged with a logocentrism as one possible economy: a "heritage of that logocentrism which is also a phonocentrism: absolute proximity of voice and being, of voice and the meaning of being, of voice and the ideality of meaning" (pp. 11–12). Logocentrism is "inextricably linked to the Greek and European tradition" and is "a uniquely European phenomenon." That structure must be deconstructed as well: "what we call the deconstruction of our own Western culture is aided and abetted by the fact that Europe has always registered the impact of heterogenous, non-European influences. Because it has always been thus exposed to, and shadowed by, its 'other,' it has been compelled to question itself."[26] The very globalization of European culture leads to its desedimentation, reveals Derrida (see pp. 3-10, 52), in a curious inversion of Husserl.[27] The globalization of science means the dominance of a logocentric structure based upon a particular mode of articulating speech and meaning, on a particular "writing" in Derrida's usage. Rather than being the local science of a devalued, supplementary institution, grammatology is the science of the possibility of science (pp. 27–8, 74). However, since grammatology in Derrida's hands undermines logo-centrism, the possibility of "grammato-logy" is at the same time its closure.

Logocentric Metaphysics

Derrida's deconstruction of philosophy is focused in an important respect on metaphysics. He claims that a certain conception of being, meaning, and truth has dominated the West throughout its history. Derrida's enterprise is derivative of Heidegger in this and many other important respects.[28] A few words to justify or at least render intelligible Derrida's reinterpretation of the Western experience in terms of its metaphysics are necessary before outlining his understanding of that metaphysics.

Derrida's focus on metaphysics may seem eccentric or even perverse, the arcane language he uses may seem obscurantist or at least forbidding. However, also like Heidegger, Derrida claims that our very way of thinking about the world and acting within it derives from a prior position articulated best by philosophy and in metaphysical terms. The way in which we are disposed toward Being for Heidegger or the manner in which we comprehend being for Derrida shapes our approach to the world and out attempts to understand it. Since our "theoretical" attitude on these two levels affects our "practice," our metaphysical stance shapes the world as well.[29] Thus, Derrida claims that "all of our political codes and terminologies still remain fundamentally metaphysical, regardless of whether they originate from the right or left."[30] Similarly, various "techniques"— scientific, military, political, and so on— can be understood only as they derive from a prior metaphysical understanding (pp. 8–9). Our metaphysical conception is actually the presupposition of science itself, or the sciences.[31] "Philosophy, as logocentrism, is present in every scientific discipline" as a "subtext." For example, he explains that the primary concepts used in political economy— "property," "work," "value"— "are all 'philosophemes,' concepts inaugurated by a philosophical discourse." Derridean deconstruction is designed in part to bring these "subtextual premises" to consciousness or to interrogate "unspoken political interests or traditional values."[32] Granted the primacy of metaphysics, then, deconstruction must operate within the discipline of philosophy and its language while at the same time disrupting it from within. As with Heidegger, this requirement leads Derrida to develop a vocabulary that is deliberately marginal, skirting the edges of philosophical discourse and thus common discourse.

Derrida finds a common thread through various philosophical conceptions from at least Plato to our time in the metaphysics of presence, or a position that understands "the meaning of being in general as <u>presence</u>" (p. 12). Logocentric metaphysics has "always assigned the origin of truth in general to logos" (p. 3). Derrida's use of the term "logocentrism" alludes to the double sense of <u>logos</u> in Greek as both "speech" and "reason." What is somehow "present" to us, especially through speech, is what <u>is</u>, what is real, what is true, and so on. Presence is privileged as being, reason, truth, legitimacy. On the other hand, within this logocentric system what is "absent" is characterized as non-being, negativity, non-presence as death. What is somehow "other" or different from what is somehow present is determined as non-being, irrationality, falsity, illegitimacy. There is a certain differentiation, hierarchalization, and even violence and mastery endemic to logocentrism. "Logocentrism" thus also alludes to the kindred verbal sense of "choosing" or "discriminating." We glimpse the outlines of the political implications of Derridean deconstruction as a critique.

Writing as the implicit or explicit absence of the (speaking) subject is the archetypal case for Derrida of a fall or distancing from presence. Writing as the production of signs and the classical determination of signification "presupposes that the sign (which defers presence) is conceivable only <u>on the basis of</u> the presence that it defers and <u>in view of</u> the deferred presence one intends to reappropriate."[33] The "only" in Derrida's statement contains the crux of his entire argument.

Logocentrism involves the search for a source of truth and meaning that somehow transcends our spatio-temporal existence, that represses differance: a "transcendental signified" (p. 49). That transcendental source can be understood in a variety of ways. It may be a pristine origin or culminating end; nature or history; the object of the intellect or evidence of the self-conscious. All of these positions are recognizable in the history of Western philosophy. In addition, since he speaks of a "narrower epoch of Christian creationism and infinitism when these appropriate the resources of Greek conceptuality" (p. 13), Derrida uses the terms "metaphysico-theological" or "onto-theological" as synonyms for "metaphysical," for example when he speaks of the notions of "origin" or "ground" as belonging to "the history of onto-theology" (p. 23).[34] Derrida treats as analytically similar both theories concerned with origins and those directed toward ends, teleological or eschatological theories. A "fall" from an origin, whether in the Bible or Rousseau, thus becomes analytically similar to a "crisis" on the way to realizing a telos, as in Husserl. "As always, this archeology is also a teleology and an eschatology; the dream of a full and immediate presence closing history, the transparence and indivision of a parousia, the suppression of contradiction and difference" (p. 115). Similarly, he writes: "History and knowledge, istoria and epistémè, have always been determined . . . as detours for the purpose of the reappropriation of presence" (p. 10).

A powerful aspect of Derrida's treatment of the Western experience is his analyze apparently divergent theories in terms of a common schema and the set of possibilities within it. His understanding of logocentric metaphysics, as well as his deconstruction of it is dependent upon his characterization of the structural impulse of phonocentrism. Indeed, he views philosophy itself as essentially structural: "it would not be difficult to show that a certain structuralism has always been philosophy's most spontaneous gesture."[35] In an essay on Rousseau and Lévi-Strauss, the structural anthropologist, Derrida asks of the constraints of structuralism: "Is it not a question of both Rousseau's project and modern linguistics belonging in common to a determined and finite system of conceptual possibilities, to a common language, to a common reserve of oppositions of signs (signifiers/concepts) which first of all is none other than the most ancient fund of Western metaphysics?" He also explains in this context that this "fund" of concepts "is articulated, in its diverse epochs, according to schemes of implication."[36] I shall turn to this latter point shortly.

While his treatment of philosophy is indebted to structuralism, the way in which he deconstructs structures pushes him beyond his intellectual forebearers, hence the label "post-structuralism for Derrida's thought among others. He discusses perhaps the two most important structuralist theorists in the first part of Of Grammatology: Saussure and Lévi-Strauss. He analyzes the primary structural oppositions these theorists propose— "signified" and "signifier" in Saussure and "nature" and "culture" in Lévi-Strauss— and undermines them. He argues that terms that delineate these structures are not simple, univocal, and opposed concepts that define a differential scale and constitute a closed structure. Rather, each of the opposites actually already contain the other imbedded within them, so that on further analysis the terms can be maintained only through a certain repression.

Perhaps the best example of Derrida's argument is to be found in his analysis of Lévi-Strauss' treatment of the incest prohibition. On the one hand, the anthropologist argues that the prohibition is universal and therefore natural. On the other hand, he admits that the prohibition is a form of law and thus cultural. The incest prohibition is paradoxically the natural imbedded within the cultural and the cultural imbedded within the natural. The opposition between nature and culture posited by Lévi-Strauss as the fundamental concept of structural anthropology cannot be sustained according to Derrida's analysis (see esp. pp. 103–5).

Derrida's deconstruction of Lévi-Strauss and the opposition between nature and culture central to his thought is intended to be exemplary. His treatment of the opposition between nature and culture is of particular importance in Of Grammatology and of particular interest for assessing his impact on the study of political thought. The discovery of the concept of nature, including its relationship to that of law, is of seminal importance for philosophy in general and political thought in particular. Derrida also views this development as "fundamental," speaking of the opposition of physis to its others — nomos, technê— which opened the entire series of oppositions nature/law, nature/convention, nature/art, nature/society, nature/freedom, nature/history, nature/mind, nature/culture, etc." and saying that it has "governed, throughout the "'history' of its modifications, the entire thinking and language of the philosophy of science up to the twentieth century."[37] Attention to this particular dichotomy will both flesh out Derrida's conception of philosophy and its deconstruction and prepare an assessment of his analysis of Rousseau.

The nature/culture opposition is part of a "system of oppositions" characteristic of logocentrism and produced within the structure or economy of differance. This opposition and others are derived from the opposition of the "irreducible absence within the presence of the trace" (p. 47). The trace must be thought before such oppositions (p. 70). Derrida therefore claims that "it suffices to accredit absolutely, here and there, the oppositions nature/convention, nature/arbitrary, animal/human, or the concepts of the sign (signified/signifier), or of representation (representer/represented) for the totality of the discourse to be affected systematically. The effects of such an opposition— which we know goes back further than Plato— can occasion an infinite analysis from which no element of the text escapes."[38] Within philosophy there is an "entire system of differences between physis and its other (the series of its 'others': art, technology, law, institution, society, immotivation, arbitrariness, etc.), and in all the conceptuality disposed within it" (p. 103).

Derrida claims that grammatology deconstructs this set of oppositions by showing, as with his reading of Lévi-Strauss, that "the completely other" is not actually other. "Let us now persist in using this opposition of nature and institution, of physis and nomos (which also means, of course, a distribution and division regulated in fact by law)," he explains, an opposition "which a meditation on writing should disturb although it functions everywhere as self-evident" (pp. 44–5). Derrida's analysis of writing as it has been treated in relation to the nature/culture opposition through the metaphor of the Book of Nature provides an example of paramount importance for his work.

Phonocentrism devalues writing as a mediated form of expression, a fall from the unmediated presence of voice, and logocentrism further devalues writing as a loss of meaning or truth. In order to reappropriate presence, we must turn from what is written and return to the original, unmediated expression (logos). Despite its pretensions, Derrida contends that philosophy cannot make this return without turning to a metaphor that reinscribes what it would proscribe. For example, he notes that Socrates in the Phaedrus devalues writing for the "writing in the soul" (p. 15), an analysis he extends in his reading of that dialogue in Dissemination. Similarly, in the Middle Ages and later one speaks of the "Book of Nature," a metaphor Rousseau uses as well. Derrida's interpretation of the metaphor is similar to his analysis of the relationship between "nature" and "culture" in Lévi-Strauss.

> The paradox to which attention must be paid is this: natural and universal writing, intelligible and nontemporal writing, is thus named by metaphor. A writing that is sensible, finite, and so on, is designated by writing in the literal sense; it thus thought on the side of culture, technique, and artifice. . . . It is not, therefore, a matter of inverting the literal meaning and the figurative meaning but of determining the 'literal' meaning of writing as metaphoricity itself. (p. 15)

Derrida's attention to metaphor in philosophy in order to show how philosophy deconstructs itself has gained him the reputation of sophistry. Such metaphors appear from a more traditional point of view as insignificant or at worst unfortunate, so that his attention to them appears at best trifling. Derrida nonetheless insists upon their revelatory importance. His insistence is premised upon his conception of phonocentrism and logocentrism. The articulations within the system— words, signs, concepts— are not univocal and self-identical, or "literal," but metaphorical on some level, tropes pointing beyond themselves.[39]

Anyone familiar with the history of philosophy or political thought might object that the relationship between nature and law, or similar concepts, has been so variously conceived throughout that history so as to make Derrida's deconstructive meditation on writing at best only locally disruptive. Even granting that a strict opposition between nature and culture, such as in Lévi-Strauss as Derrida presents him, is susceptible to something like Derrida's reading, how could deconstruction apply to the whole of philosophy? For example, is the natural law tradition, where the terms are not simply in opposition, susceptible to such a reading? Or the historical schools? Derrida nonetheless claims that all these positions are deconstructable as heirs to a logocentric metaphysics that is merely structuring such oppositions in differing ways or producing different economies. "All dualisms, all theories of the immortality of the soul or of the spirit, as well as all monisms, spiritualist or materialist, dialectical or vulgar, are the unique theme of a metaphysics whose entire history was compelled to strive toward the reduction of the trace." All of these conceptual systems have in common an exclusion of the "other," or schematically, "the exclusion of writing" (p. 71). He insists that the apparent discontinuities within the philosophical tradition rest upon the continuity provided by its phonocentric and logocentric foundation.

Discontinuity: The Epoch of Western Metaphysics and its Epochs

Derrida speaks of "the great epoch covered by the history of metaphysics" (p. 13). He reveals the phenomenological source of his concept of the epoch and his departure from that tradition when he refers to Husserl's concept of "epoché." Since that logocentric epoch privileges presence as meaning, it is the epoch of meaning. "The transgression of meaning is not an access to the immediate and indeterminate identity of a nonmeaning, nor is it an access of maintaining nonmeaning," for that would but invert the logocentric concept of meaning as maintenance of identity. "Rather, we would have to speak of an epoché of the epoch of meaning . . . : the opposite of a phenomenological epoché, for this latter is carried out in the name of and in sight of meaning."[40] The epoch of Western metaphysics comes to sight at its closure. That "epoch" is both a historical category, a period of time, and a specific understanding of transcendent meaning controlling and producing that epoch.

Within the overarching epoch of logocentric metaphysics in which being is determined as presence are found "all the subdeterminations which depend on this general form and which organize within it their system and their historical sequence" (p. 12). These subdeterminations can be analyzed as sub-systems or sub-economies within the more general logocentric economy or as historical periods in their sequence. Derrida presents the following sequence in a fashion that contains both criteria: "presence to the thing to the sight as eidos, presence as substance/essence/existence [ousia], temporal presence as point [stigmè] of the now or of the moment [nun], the self-presence of the cogito, consciousness, subjectivity, the co-presence of the other and of the self, intersubjectivity as the intentional phenomenon of the ego, and so forth" (p. 12). At another point he speaks of "the instance of the logos or of a reason thought within the lineage of the logos," with "instance" recalling instantiation and lineage a sequence: "in the pre-Socratic or the philosophical sense, in the sense of God's infinite understanding or in the anthropological sense, in the pre-Hegelian or the post-Hegelian sense" (pp. 10–11).

The history of metaphysics runs from the pre-Socratics to Heidegger, or more narrowly from Plato to Hegel (p. 3). Derrida equivocates because in his view Hegel "undoubtedly summed up the entire philosophy of the logos" in a way still dominant today (pp. 24–5). Furthermore, Derrida appears to argue that when one removes eschatology, or the Absolute, Hegel "is also the thinker of irreducible difference" (p. 26), and his influence on later thought is thus seen even more clearly.[41]

Although he speaks of the logocentric epoch beginning with the pre-Socratics, unlike Heidegger, Derrida resists viewing the epoch of the history of metaphysics as a developing history with a definite beginning and less definite end, or a destiny. The Greeks had no special proximity to a logos, from which we have fallen, he says, and warns that "the fascination with the pre-Socratics to which we have been provoked by Nietzsche, then by Heidegger and several others, would carry with it a share of mystification whose historico-philosophical motivations remain to be examined."[42] Derrida does identify logocentrism with the West and sketch its history, and so he must view its source and development as historical to that extent. However, he is interested more in the way in which the metaphysics of presence is specifically enunciated within this general structure, or the "general economy" of concepts as it is variously articulated. "Between the overture and the philosophical accomplishment of phonologism (or logocentrism), the motif of presence was decisively articulated." Derrida appears to use "articulated" here in its dual sense. This usage is strange considering his association of the term with phonocentrism and logocentrism and it marks the tension in his periodization of Western thought.

Derrida maintains that "the most decisive separation" within the general epoch of metaphysics occurs with Descartes. The metaphysics of presence "underwent an internal modification whose most conspicuous index was the moment of certitude in the Cartesian cogito" (p. 97). Descartes reads the "great book of nature" from a new perspective where "the determination of absolute presence is constituted as self-presence, as subjectivity" (p. 16). The Cartesian turn involves locating presence subjectively, not somehow objectively in the ideas, or God, or other previous determinations. After Descartes, "this objectivity takes the form of representation, of the idea as the modification of a self-present substance conscious and certain of itself at the moment of its relationship to itself." Although God is no longer the objective source of ideality after Descartes, according to Derrida the divinity remains as a principle that secures subjective certainty. "God is the name and the element of that which makes possible an absolutely pure and absolutely self-present self-knowledge. From Descartes to Hegel and in spite of all the differences that separate the different places and moments in the structure of that epoch, God's infinite understanding is the other name for the logos as self-presence" (pp. 97–8).[43] Derrida's characterization of this epoch will direct him in his reading of Rousseau as well.

Derrida claims that objectivity after Descartes takes the form of "representation." Objective ideas or concepts are modifications of the subjective source of being and certainty and are re-presentations of it.[44] Such representations have the danger of being false or inaccurate representations. The political aspect of representation and its dilemmas comes out in Derrida's interpretation of Rousseau. Since he will even venture to say that "representation" is the "essence of modernity" entirely (p. 296), his interpretation of Rousseau on this point is revelatory of his conception of modern politics and political theory more generally.

Derrida makes his claim about the defining character of "modernity" despite his reticence he expresses about the term elsewhere. "I have never been very happy with the term 'modernity.' Of course, I feel that what is happening in the world today is something unique and singular. As soon, however, as we give it the label of 'modernity,' we inscribe it in a

certain historical system of evolution or progress (a notion derived from Enlightenment rationalism) which tends to blind us to the fact that what confronts us today is also something ancient and hidden in history."[45] This is the occasion for his remarks quoted above about the continuity and discontinuity of history. His explanation reveals two points. First, he does not so much object to the historical periodization producing a notion of "modernity" as the equation of that notion with a whole set of beliefs about progress and history. Second, he accepts such a periodization as long as one recognizes that behind it lies a determination within the system of metaphysics that reveals both the continuity and discontinuities within its epoch. His interpretation of Rousseau as an exemplar of that epoch is dedicated to this dual recognition of continuity and discontinuity.

Discontinuity, Continued: Rousseau and His Epoch

Derrida Reading Rousseau

Derrida treats Rousseau as exemplary of the epoch running from Descartes to Hegel and a decisive moment within it. At the same time, however, he takes Rousseau to be exemplary of an important phenomenon in epoch of metaphysics as a whole. Within the age of metaphysics from Descartes to Hegel, "Rousseau is undoubtedly the only one of the first one to make a theme or a system of the reduction of writing profoundly implied by the entire age. He repeats the inaugural movement of the Phaedrus and De interpretatione but starts from a new model of presence: the subject's self-presence within consciousness or feeling [sentiment]" (p. 98; Fr. p. 147).[46]

Derrida chooses Rousseau's Essay on the Origin of Languages, a little-known text before Derrida, as the primary text he will read in Of Grammatology. The Essay contains a discussion of the origin and progress of languages (and music), a related argument about the detrimental effects of writing, and a concluding section on the relationship of languages (and writing) to government.[47] Rousseau's discussion of the relationship between speech and writing in the Essay provides Derrida with a convenient exemplar for his purposes. Further, the way in which Rousseau relates his more narrow subject in that work to the themes of nature, history, and politics allows Derrida to develop a more general interpretation of Rousseau.

Derrida admits that his choice of the Essay as the exemplar of Rousseau and his epoch may appear "exorbitant." His choice may appear exorbitant because Rousseau's argument in the work that languages are passionate or figurative in origin, not rational, makes him "distinctly a maverick in Western thought about language." Nonetheless, his argument about the passionate origin of language appeals to a metaphysics of presence in Derrida's sense, and "From this perspective Rousseau is in the mainstream" and "[h]is difference from Plato or Descartes or Hume concerns the sort of thing or experience whose unmediated presence provides the foundation of what we mean, what we express, when we speak."[48] In Derrida's terms, then, the Essay represents the classical devaluation of writing on a new model of the metaphysics of presence.

Derrida's analysis of Rousseau's discussion of writing (in the normal sense) in the Essay is interesting, but his treatment of one sort of "writing" (in his sense) is more revelatory of his project and interesting as an interpretation of Rousseau. This more interesting treatment can be seen from his explanation of the exemplarity of the "Rousseauist moment" near the beginning of Of Grammatology:

> Rousseau repeats the Platonic gesture by referring to another model of presence: self-presence in the senses, in the sensible cogito, which simultaneously carries in itself

> the inscription of divine law. On the one hand, representative, fallen, secondary, instituted writing, writing in the literal and strict sense, is condemned in the Essay on the Origin of Languages. . . . On the other hand, on the face of the same proposition, writing in the metaphoric sense, natural, divine, and living writing is venerated; it is equal in dignity to the origin of value, to the conscience as divine law, to the heart, to sentiment, and so forth. (p. 17)

Derrida claims that Rousseau's model of presence in the sensible cogito, or sentiment, or conscience "carries within it the inscription of divine law." His primary example in Of Grammatology will be Rousseau's treatment of pity.

The subject of pity is important in the Essay in part because of the widely-held position that the Essay contradicts Rousseau's other works on the natural status of pity. In brief, Rousseau's discussion of pity in the Essay (and in similar passages in Emile) is said to contradict his account in the Second Discourse: in the Second Discourse Rousseau implies that pity is initially active and thus natural while in the Essay he states it only develops later.[49] The choice of the Essay would be exorbitant, too easy, for Derrida's purposes if the contradiction remained after scrutiny. In this interpretation, Derrida would have seized on the ambiguous role of pity as either natural or developed, or both, unfairly, allowing him to cite pity as an example of the way in which Rousseau is unable to keep the opposed terms of his structure— the natural and the civil— in strict opposition. This is indeed Derrida's argument about Rousseau. However, what is interesting about his interpretation is that he argues rightly that there is no substantial contradiction concerning pity in the Essay and Rousseau's other works (pp. 171–94) and that he is correct about the ambiguous role of pity in Rousseau's thought. The question is what this ambiguity suggests.

Derrida's strategy of deconstructive reading at least in the case of Rousseau involves a charitable premise. He accepts that Rousseau's thought is consistent in all important respects and that apparent inconsistencies, such as the one concerning pity, can be explained after a close textual analysis. Derrida thus respects Rousseau's own statements about the consistency of his writings. Derrida's principle of charity and method of close reading has indeed been a point of attack of some who like the deconstructive aspect of his readings but view his methods as an unfortunate textual fetishism left over from a bygone epoch.[50]

Despite Derrida's acknowledgment of Rousseau's consistency, it is not clear whether one could say Derrida finds him coherent. In one sense Derrida accepts that Rousseau's thought is coherent given his consistent intention, but in another sense it does not cohere but instead displays ruptures despite Rousseau's intentions. For example, Derrida argues that in spite of Rousseau's declared intention to locate the simple, natural origin of language he cannot exclude what appears supplementary to that origin from that origin, for example writing as articulation and thus as convention. "His declared intention is not annulled by this but rather inscribed within a system which it no longer dominates" (p. 243; see pp. 149–50). Rousseau "says what he does not want to say, describes what he does not want to conclude. . . . Rousseau is not alone in being caught in the graphic of supplementarity. All meaning and therefore all discourse is caught there, particularly and by a singular turn, the discourse of the metaphysics within which Rousseau's concepts move." Rousseau represents but one manifestation of a meta-text, a world of discourse understood as a text, and he himself is not properly in control of that discourse and thus an author in that sense. Derrida is led to conclude from this that "[t]here is not, strictly speaking, a text whose author or subject is Jean-Jacques Rousseau" (p. 246). Derrida's principle of charity is ultimately uncharitable. Derrida's tactics in analyzing a more limited example of a concept that breaks down under scrutiny, and I will concentrate on his treatment of pity in Rousseau, will help make sense of his general strategy of deconstructive reading and the claims he makes.

The Economy of Pity in Rousseau

Rousseau's argument about the role of pity is well-known. In the Second Discourse he argues in explicit response to Hobbes that self-love alone is incapable of explaining human behavior. Hobbes did not notice "another principle" that softens "under certain circumstances, the ferocity of his amour-propre or the desire for self-preservation before the birth of amour-propre— tempers the ardor he has for his own well-being by an innate repugnance to see his fellow-man [semblable] suffer." Although man is not naturally social according to Rousseau, natural pity provides a pre-social basis for the social passions and virtues that arise later: "from this quality alone flow all the social virtues." Finally, he concludes with a statement which will be of great interest to Derrida: "pity is a natural sentiment which, moderating in each individual the activity of love of oneself, contributes to the mutual preservation of the entire species . . . in the state of nature, it takes the place of laws, morals, and virtue, with the advantage that no one is tempted to disobey its gentle voice."[51]

Rousseau's discussion of pity in the Second Discourse appears to affirm its wholly natural and innate character, but he quietly admits that "commiseration is only a sentiment that puts us in the position of him who suffers— a sentiment that is obscure and strong in savage man, developed but weak in civilized man."[52] This admission contains the ambiguity of his position on pity. Pity only develops fully in civilized man, as he admits in the Essay: "Pity, although natural to the heart of man, would remain eternally inactive without the imagination which puts it into play. How do we let ourselves be moved to pity? By transporting ourselves outsides of ourselves; by identifying ourselves with the suffering being. . . . Consider how much this transport presupposes acquired knowledge!"[53] In addition, since pity is a sentiment that puts us in the place of another, in some sense it is a modification of self-love, as Rousseau indicates in the Emile when he states that "all the passions" derive from self-love.[54] Pity is "the first relative sentiment which touches the human heart according to the order of nature."[55] Rousseau therefore always qualifies his discussion of the naturalness of pity. He either explicitly notes that pity has a natural basis but requires developed faculties and passions to develop it fully or quietly attenuates his more direct statements about its naturalness, as in the Second Discourse, where he perhaps exaggerates the role of pity for rhetorical purposes. There is no fundamental contradiction between the Second Discourse and Essay (or Emile). Derrida makes essentially the same argument presented here about Rousseau's treatment of pity (see pp. 182–92).

For Derrida Rousseau's apparent equivocation on pity reveals a deeper rupture running through his thought, and, as an exemplar of Western metaphysics as a whole, through the whole logocentric epoch. Derrida's argument about the revelatory significance of pity in Rousseau's thought refers once again to the nature/convention opposition he finds throughout logocentric philosophy. What interests Derrida about Rousseau's discussion of pity is the inbetweenness of the sentiment: its place between nature and culture and its role as a supplement to each.

Derrida suggests that the inbetweens in Rousseau's thought— pity, perfectibility (or "potentiality" as Derrida recharacterizes it), and so on— are essential to his thought, and revelatory of logocentrism more generally. "What Rousseau thus reveals is the neutral origin of all ethico-political conceptuality, its field of objectivity, and its axiological system. All the oppositions that follow in the wake of the classical philosophy of history, culture, and society must therefore be neutralized" (pp. 188–9). Rousseau can affirm contradictory values at the same time (p. 189). Or, similarly, two interpretations, for example concerning pity or perfectibility, are possible at the same time in his thought not because of his inconsistency,

but because of the structure of supplementarity within which he writes but cannot control (pp. 178–9).

Derrida fastens on the inbetweenness of pity to suggest a fundamental structure of supplementarity in Rousseau's thought. He argues that despite his intention to find a pristine natural origin— for speech, for man, and so on, Rousseau must inscribe what is supplemental into what is supposed to be original, as with law being inscribed in natural pity. He claims that he can show that "comprehended by the entire system of oppositions that it sustains, the concept of natural pity is fundamental" (p. 181). He describes two series of opposed terms that work themselves out in Rousseau's thought: "(1) animality, need, interest, gesture, sensibility, understanding, reason, etc. (2) humanity, passion, imagination, speech, liberty, perfectibility, etc." These series "always relate to each other according to the structure of supplementarity" (p. 183). For example, Rousseau says that man is by nature an animal, but on the other hand his possession of language and perfectibility, which are closely related, differentiate him from the animals, a point he makes at the outset of the Essay. Language and perfectibility both rely upon imagination to be put into play, as does pity. "Imagination is the becoming-human of pity." Pity, as well as language and perfectibility, are "virtual" faculties: in between passivity and activity, animality and humanity, asking us to thin, of nature in Rousseau "not as a given, as a real presence, but as a reserve" (p. 185).

Derrida argues that Rousseau cannot keep nature and civilization apart, as he seems to want to do in the Second Discourse, where pity seems less ambiguously on the side of nature. Pity is the archetypal case of the breakdown of the supposed oppositions in Rousseau's economy. This breakdown becomes manifest in the Essay where Rousseau's subject makes him attend more to the continuity of developments from nature to civilization than he had to in the Second Discourse, as Derrida acutely notes. Pity in the Essay: "As always, it is the ungraspable limit of the almost. Neither nature nor society, but almost society. Society in the process of birth." Rousseau cannot but show "the becoming-culture of nature" through pity and other terms of his thought (p. 253).[56]

The ambiguities of Rousseau's position have indeed raised questions about his thought. For example, if "perfectibility" is the distinguishing characteristic of man, then in what sense can the progress in our passions and faculties on the level of both the species and the individual be said to be unnatural or accidental? Is unperfected or perfected man more "natural"? Rousseau definitely says the former, but what prevents us from interpreting him otherwise? A flock of interpreters influenced by Kant or Marx, thinkers themselves influenced by Rousseau, have so interpreted Rousseau. These are certainly obstacles to understanding Rousseau's thought, but it is their status in his thought and what they reveal that is in question. A closer look at Derrida's reading of Rousseau's treatment of pity is necessary.

Derrida deconstructs Rousseau's treatment of pity in the same manner as his broader deconstruction of the opposition of nature and its other in the Western logocentric tradition as he reads it. That no one dare "disobey" the "soft voice" of pity indicates that this sentiment operates as a law, according to Derrida. Pity takes the place of— supplements— instituted law. When (natural) pity is overcome by developed self-love and no longer restrains us, laws must be instituted: convention must supplement nature. Derrida analyzes this progress as a chain of supplements. "The order of pity 'takes the place of law,' it supplements law, that is to say instituted law. But as institutional law is also the supplement of natural law when the latter is lacking, it is clear that only the concept of the supplement allows us to think the relationship between nature and law here. These two terms have no meaning except within the structure of supplementarity" (p. 173; emphasis supplied).

Derrida's reading of Rousseau is persuasive to a point, for he redirects our attention to an interesting paradox in Rousseau's thought and tries to resolve it in an provocative fashion. Nonetheless, is Derrida's interpretation convincing? Is Rousseau's text only comprehensible, does it have no meaning except, through Derrida's understanding of supplementarity and his critique of logocentric metaphysics more generally? Does Derrida really uncover a paradox in Rousseau? Or is it Rousseau himself who self-consciously examines pity in this fashion, with Derrida ignoring Rousseau's paradoxical insight only to claim it for himself? Is Derrida's understanding of Rousseau's conception of pity correct in the first place?

Derrida rightly notes that Rousseau says that by nature no one will "disobey" the voice of pity. He then claims that pity is metaphorically a law and, based on his conception of the essential metaphoricity of philosophy, builds the expected interpretation where he finds law inscribed in what is supposed to be a univocal concept of nature, despite Rousseau's intentions. He makes a global claim about logocentric philosophy, of which Rousseau is exemplary, that all articulation or distribution is in fact legal or prescriptive: "There is much to say about the fact that the native unity of the voice and writing is prescriptive. Arche-speech is writing because it is law" (p. 17). However, how metaphorical is Rousseau's remark about no one disobeying pity? This is not meant to be a quibble over Derrida's claims about metaphoricity or covert attack on it, for one could argue that it is incumbent upon Derrida to exhaust the obvious interpretations as they arise out of the text. In this case, Rousseau's own statements about the character of pity are essential for understanding what he means. If pity is a natural passion that moves us, however strongly, before reflection, then how could one "disobey" it in any real sense? Is law the proper metaphor here, or is it rather natural necessity? If the latter, then in what sense could one disobey a law of nature. In this case, "obedience" to pity is similar to "obedience" to the dictates of self-love, self-preservation., or natural right. How likely is it that one will "disobey" such a dictate, or is the legal metaphor ultimately and intentionally misleading?[57]

Derrida's assimilation of pity to natural law is especially troubling considering Rousseau's argument in the Second Discourse as a whole. As has been noted by several scholars,[58] Derrida ignores the fact that this work contains an argument against the concept of natural law altogether. In the Preface to the Second Discourse Rousseau states concerning natural law: "All that we can see very clearly concerning this law is that, for it to be law, not only must the will of him who is bound by it be able to submit to it with knowledge; but also, for it to be natural, it must speak directly by nature's voice."[59] Since Rousseau argues that man does not by nature possess the reason or knowledge requisite for natural law to be a law in this sense, his argument is in fact an attack on the concept of natural law. In addition, as one of the two principles anterior to reason, and perhaps reducible to the other, pity does indeed speak directly by nature's voice, but as passion, not as law. Rousseau intentionally blurs his position on natural law.

Nonetheless, Derrida does present evidence that Rousseau conceives of pity, and especially conscience, as a natural law in a more traditional sense. He cites the "Profession of Faith of the Savoyard Vicar" in the Emile: "'The more I retreat into myself, the more I consult myself, the more plainly do I read these words written in my soul: by just and you will be happy. . . . [...] I find them in the depths of my heart written by nature in characters which nothing can efface'" (p. 17). These characters, Derrida contends, are supposed by Rousseau to have been written by God's hand. The Vicar's doctrine of conscience is based on a dualist metaphysics and assimilated to the tradition of natural law. His teaching is indeed relatively traditional if not quite orthodox (and Derrida does note therefore that the doctrine revolves around a non-traditional notion of the self-evidence of a "sensible cogito" rather than a rational soul). However, the Vicar is not Rousseau and a careful analysis of the "Profession" has to be read with Rousseau's rhetorical motives in mind. Namely, Rousseau

presents the "Profession" as a useful moral teaching rather than as essentially true. Rousseau's intentions are indicated in a number of ways. Aside from internal evidence gained from attention to the novelistic presentation of the Emile in general and "Profession" in particular, and apart from and the evidence generated after a patient comparison of the "Profession" and what Rousseau says in his own name in the Emile and elsewhere (especially what he says about pity and conscience), perhaps the most revealing piece of evidence can be found in the Reveries. Rousseau admits in that work that he sometimes lies for the good of others and he connects that admission to the "Profession."[60] Derrida is usually quite alert to the rhetorical strategies of an author, but he ignores Rousseau's own self-conscious rhetorical ploys in the case of natural law, conscience, and pity.[61]

Rousseau intentionally gives pity and perfectibility an ambiguous place between nature and culture. This ambiguity may reveal not the supplementary character of his thought or of Western thought, but a profound and difficult articulation of a problem confronted by the entirety of the Western philosophic tradition and an articulation that was of immense consequence within that tradition. His discussion of natural law is similarly ambiguous, not because he unconsciously heeds the edicts of supplementarity and resurrects the trace despite himself, but because his own conception of the relationship of nature to convention and law is intentionally innovative, and that innovation affects his treatment of "natural law." What is striking about Derrida's interpretation is the way in which he seems to ignore Rousseau's own insights into the problematic relationship of nature and culture in order to claim the insight as his own.

If Rousseau's articulation of the relationship between nature and culture or civilization is indeed of epochal significance, then Derrida's characterization of Rousseau as exemplary of an epoch stretching from Descartes to Hegel would be questionable and we might have to periodize the course of philosophy somewhat differently. For example, many interpreters have suggested that Rousseau introduced or at least made prominent the concept of history and the historicity of human nature into philosophy when he proclaimed that the lesson of the Second Discourse was that "the human race of one age" was not "the human race of another."[62] His statement is premised on his conception of what might be called the dialectical relationship among human needs, passions, and reason, a conception meant to challenge previous understandings of human nature: "Whatever the moralists may say about it, human understanding owes much to the passions , which by common agreement also owe much to it. It is by their activity that our reason is perfected."[63] The role of history in Rousseau's thought and his dialectical psychology are both central to his understanding of the relationship between natural man and civil man.

Given all this, the relationship posited by Derrida between Rousseau and both his predecessors and successors would have to be reassessed. As for the former, Rousseau's novel articulation of the relationship between nature and society and his introduction of history into philosophy might mark a decisive break from Descartes, and perhaps more importantly Hobbes and Locke, that would force us to reconsider Derrida's periodization. As for the latter, Rousseau's discussion of history and quasi-dialectical conception of human development might be said to have decisively influenced his successors, notably Hegel but also Nietzsche (for Rousseau might be said not to have proclaimed the historical nature of man, but the historicity of human nature), thus forcing us to reassess Derrida's periodization of philosophy in another way. This reassessment might not involve only a reperiodization of the history of philosophy, for we can admit with Derrida the problematic character of periodization, but also a very different understanding of the exemplary status of Rousseau, an understanding that would call into question Derrida's understanding of Western thought and Rousseau's place within it.

Conclusion

What is Derrida's significance for the study of the history of political thought? I believe that the foregoing discussion suggests different answers on two levels. On one level we have to assess the premises of Derrida's deconstructive reading of the texts of that tradition and on another level we have to assess his periodization of that tradition and treatment of certain figures, here Rousseau, as exemplary within it.

Derrida's reading of the entirety of the Western philosophical tradition rests upon the premise that its continuity is based on a certain logocentric metaphysics which in turn is based on an endemic phonocentrism. Derrida's claim needs to be investigated. At least in the case of his reading of Rousseau, however, that premise does not flow from his analysis but directs his reading from the outset: that is, his premise about logocentrism and phonocentrism is precisely a premise. Derrida's premise is provocative and merits inquiry, but I suggest that such an inquiry must take place within the confines of philosophy and otherwise risks degenerating into an orthodox method, as Derrida himself points out. In sum, Derrida's characterization of Western philosophy requires an analysis on one level. The results of that analysis could have an immense bearing on our understanding and study of the texts of political thought.

Derrida's periodization of the history of philosophy and choice of exemplars within it are self-admittedly problematic, and I have suggested problems with them. In the final analysis, however, Derrida's periodizations are not particularly surprising, and are even mundane. Divorced from the premises of his reading of philosophy as a whole, his treatment of epochs and exemplars within this history is relatively uninteresting and does not itself have much promise for students of political thought.

The usefulness of Derrida's reading of philosophy for the study of political thought lies at the point of contact between the two levels of analysis I have suggested. Based on my investigation to this point, I would maintain a suspicious agnosticism about the first level of Derrida's project and, on the second level, find myself able to pursue a dialogue with Derrida and others, though on that level alone that dialogue seems to me to be of uncertain interest. I find Derrida's attention to the main problems within the tradition of philosophy, notably the relationship between nature and law, what is of particular interest in his reading. While I do not find his own conception of the meaning of those problems convincing, the fact that he focuses or refocuses our attention on those problems is itself important. The study of political thought must not be sedimentized, political thought itself must not be ossified. Derrida's reading of Rousseau and others can serve as a catalyst to revivify political thought, but further research is necessary in order to determine whether his project of deconstruction is ultimately constructive.

For examples of readings of politics and political thought influenced by Derrida, see the essays by Michael Ryan and Spivak in Mark Krupnick, ed., Displacement: Derrida and After (Bloomington: Indiana University Press, 1983).

[5] Derrida, Memoires for Paul de Man, trans. Cecile Lindsay, Jonathan Culler, Eduardo Cadava, and Peggy Kamuf, revised edition (New York: Columbia University Press, 1989), p. 15. As the acknowledged paterfamilias of deconstruction on at least two continents, Derrida often has been called upon to give an account of his theoretical offspring, to reconcile kin and ken. His statement about a history of deconstruction is made by way of explaining why he will not speak about deconstruction in America as suggested by his hosts. On the same principle he warns: "Similarly, no matter what their interest or their necessity maybe today, the social sciences . . . cannot, as such, claim to "objectify" a movement which, essentially, questions the philosophic, scientific, and institutional axiomatics of those same social sciences" (ibid.). The attempt to objectively periodize deconstruction and its own problematic periodizations is untenable, at least on deconstruction's own terms.

[12] Derrida, "The Supplement of Copula: Philosophy Before Linguistics," in Margins of Philosophy, pp. 175–205; p. 177.

[13] Derrida, "Interview," in Kearney, p. 108.

[14] My use of the term "Archimedean point" alludes to the debate over whether phonocentrism and differance serve Derrida as transcendental principles and make him a transcendental philosopher of sorts despite his apparent statements to the contrary. See, e.g., Norris, Derrida; Pippin, Modernism as a Philosophical Problem, pp. 160–62; Richard Rorty, "Is Derrida a Transcendental Philosopher?" in Essays on Heidegger and Others: Philosophical Papers, Volume 2 (Cambridge: Cambridge University Press, 1991), pp. 119–28; Rose, Dialectics of Nihilism, chap. 8, esp. p. 139, where she reveals Derrida's "dilemma": "For differance, defined as 'productive,' is either the old transcendental enigma. . . ; or, if it is knowable, differance must fall into some kind of presence— the only knowability acknowledged and spurned by Derrida."

[15] Derrida, "Interview," in Kearney, pp. 115–16.

[16] Derrida cites Aristotle, De Interpretatione, 1, 16a 3. However, as James B. Murphy first pointed out to me, Derrida's translation is incorrect, using "symbols" to translate both semeia and symbola. The correct translation should be: spoken words are signs of mental experience and wrtten words are the symbols of spoken words." This is also noted by Newton Garver, "Derrida on Rousseau on Writing," Journal of Philosophy 74 (1977): 663–73; p. 671. Derrida fails to note how for Aristotle the human soul stands in relation to being and beings on the one hand and speech on the other does not stand in an immediate relation of "presence," as he claims. Stanley Rosen makes a similar criticism of Derrida on Plato in his profound study of Derrida, "Platonic Reconstruction," in Hermeneutics as Politics (Oxford: Oxford University Press, 1987), pp. 50–86.

[17] Aristotle, Politics I.2, 1253a7–18. Aristotle explicitly relates his definition of man as the being possessing reason to his characterization of him as the "political animal" (ibid., 1252b27–34). Derrida's understanding of the logocentrist phonocentrism of the West would bear on his understanding of the political thougth and politics of that tradition as well. See "Violence and Metaphysics: An Essay on the Thought of Emmanuel Levinas," in Writing and Difference, pp. 136–8.

[18] Zuckert raises a similar problem while noting Derrida's implicit rejection of Aristotle, "Politics of Derridean Deconstruction," pp. 353–4. See also her discussion of Heidegger's relation to Aristotle on this issue, "Martin Heidegger: His Philosophy and His Politics," Political Theory 18 (1990): 51–79; pp. 59–61.

[19] As Norris notes, Derrida thus draws out the radical implications of structuralism, and specifically Saussurean linguistics: "if language is always and everywhere a system of differential signs— if meaning subsists in various structures of relationship and not in some ideal correspondence between sound and sense—then the classical definition of writing would apply to every form of language whatsoever" (Derrida, p. 85).

[23] Derrida, Speech and Phenomena, p. 82.

[24] See Derrida, "Some Statements and Truisms About Neo-logisms, Newisms, Postisms, Parasitisms, and Other Small Seismisms," in David Carroll, ed., The States of "Theory": History, Art, and Critical Discourse (New York: Columbia University Press, 1990), pp. 63–94.

[25] Derrida, "Interview," in Kearney, p. 116.

[26] Derrida, "Interview," in Kearney, pp. 115–16.

[27] Edmund Husserl, "Philosophy and the Crisis of European Man," in Phenomenology and the Crisis of European Man, trans. Quentin Lauer (New York: Harper and Row), pp. 149–92. Derrida touches critically on Husserl's view of the ideal of European science in his first work, Edmund Husserl's "Origin of Geometry": An Introduction, trans. John P. Leavey, Jr. (Lincoln: University of Nebraska Press, 1989 [1962]).

[28] See Martin Heidegger, An Introduction to Metaphysics, trans. Ralph Mannheim (New Haven: Yale University Press), esp. chap. 1. Derrida declares that Heidegger exercizes "the most constant influence" on his work ("Interview," in Kearney, p. 109). In any early work, Derrida avers that "no one before has better escaped" the grasp of classical metaphysics and ontology (Speech and Phenomena, pp. 25–6 n.). In Of Grammatology Derrida accentuates the more critical aspect of this judgment: "logocentrism is not totally absent from Heidegger's thought," though he excuses Heidegger— and himself— by saying that "one does not leave the epoch whose closure one can outline" (p. 12). Derrida objects to Heidegger's nostalgia for Being as a ground and his position that "the word 'being' . . . is, with some others, an 'originary word' (Urwort), the transcendental word assuring the possibility of being-word to all other words" (p. 21). He denies that being escapes the movement of differance he outlines in Of Grammatology and elsewhere. Derrida understands his project in some sense as a completion of Heidegger's. His position with regard to Heidegger is thus similar to Heidegger's with regard to Nietzsche. For the relationship between Heidegger and Derrida, see, e.g., Paul De Man, Blindness and Insight: Essays in the Rhetoric of Contemporary Criticism (New York: Oxford University Press, 1971), p. 138. For a revealing discussion of Derrida's debt to Heidegger with attention to their political positions, see Zuckert, "The Politics of Derridean Deconstruction."

[29] For Derrida's discussion of the false understanding of the relationship between theory and practice, especially as codified in the university, see "The Principle of Reason: The University in the Eyes of its Pupils," Diacritics 19 (1983), 3–20.

[30] Derrida, "Interview," in Kearney, p. 120.

[31] See Heidegger, The Question Concerning Technology and Other Essays, trans. William Lovitt (New York: Harper and Row, 1977).

[32] Derrida, "Interview," in Kearney, pp. 114–15. Deconstruction thus coheres with the historical or historicist critical enterprises of Marx, Nietzsche, Freud, and Foucault, among others.

[33] Derrida, "Differance," in Speech and Phenomena, p. 138.

[34] See also Derrida, "Interview," in Kearney, p. 116. Following Nietzsche, Derrida even claims that the metaphysical epoch is "essentially theological," so that even atheism is viewed as a form of theist thinking (p. 4 and n. 3; p. 14).

[35] Derrida, "'Genesis and Structure' and Phenomenology," in Writing and Difference, pp. 154–68; p. 159. Derrida makes this statement within a discussion of Husserl. Derrida's project might be seen as a combination of the structural and phenomenological enterprises (see Norris, Derrida, pp. 224–8). Derrida finds Husserlian phenomenology rigorous but still controlled by the metaphysics of presence (see Speech and Phenomena, esp. pp. 4–5). Husserl's attempt to join origins and ends, the ideal origin of science or philosophy that points to its telos, shows a structural tendency in combination with a phenomenological reduction, a combination Derrida views as one of tension. The very rigor of Husserl's thought makes the limitations of Western philosophy as a whole particularly revealing for Derrida

[36] Derrida, "Linguistic Circle of Geneva," p. 140.

[37] Derrida, "Linguistic Circle of Geneva," p. 152.

[38] Derrida, "Linguistic Circle of Geneva," p. 151.

[39] For Derrida's argument about metaphor and philosophy, see "White Mythology: Metaphor in the Text of Philosophy," in Margins of Philosophy, pp. 207–73. Elsewhere Derrida gives what might be viewed as a more Nietzschean reading of the metaphoricity of philosophy: "I have always tried to expose the way in which philosophy is literary, not so much because it is metaphor but because it is catachresis. The term metaphor generally implies a relation to an original 'property' of meaning, a 'proper' sense to which it indirectly or equivocally refers, whereas catachresis is a violent production of meaning, an abuse which refers to no anterior or proper name" ("Interview," in Kearney, p. 123).

[40] Derrida, "From Restricted to General Economy," p. 268. For Husserl's conception of "epoché," see 000

[41] See Derrida, "From Restricted to General Economy."

[42] Derrida, "Cogito and the History of Madness," in Writing and Difference, pp. 31–63; pp. 39–40.

[43] Derrida's characterization of Descartes and Hegel presupposes a rather orthodox reading of these philosophers. As noted above, in her Dialectic of Nihilism Rose challenges

Derrida's reading of Hegel as the philosopher of the Absolute by claiming that he is mistaken and does not draw out the radical aspects of Hegel's thought, rather reserving to himself the credit for those aspects. Derrida's reading of Descartes' argument about God could be similarly challenged. For example, a less orthodox or superficial reading of Descartes' argument in Part Four of the Discourse on Method, or the parallel discussion in the Mediations, could have him conclude, "Je pense, donc Dieu est," significantly altering the usual understanding of the role of the divinity in his project. For a insightful reading of Descartes along these lines, consider Michael Davis, Ancient Tragedy and the Origins of Modern Science (Carbondale, Illinois: Southern Illinois University Press, 1988), chaps. 3–4.

[44] Derrida builds on Heidegger's similar characterization of Descartes and modernity more generally. See Heidegger, "The Question Concerning Technology" and "The Age of the World Picture," in The Question Concerning Technology. Derrida's views on continuity and discontinuity within the epoch of metaphysics generally follows Heidegger as well.

[45] Derrida, "Interview," in Kearney, p. 112.

[46] The movement from Descartes' cogito to Rousseau's sentiment is perhaps authorized by Descartes himself since he relates cogitare and sentire in the Second Meditation of the Meditations on First Philosophy (Meditationes de prima philosophia, ed. George Heffernan [Notre Dame: University of Notre Dame Press, 1990], p. 104).

[47] Jean-Jacques Rousseau, Essay on the Origin of Languages, in Essay on the Origin of Languages and Theoretical Writings on Music, trans. and ed. John T. Scott, vol. 7 of Collected Writings of Rousseau, ed. Roger D. Masters and Christopher Kelly (Hanover: University Press of New England, forthcoming 1995); Essai sur l'origine des langues, ed. Jean Starobinski (Paris: Gallimard, 1990).

[48] Newton Garver, "Derrida on Rousseau on Writing," Journal of Philosophy 74 (1977): 663–73; pp. 669–70.

[49] See Rousseau, Discourse on the Origin and Foundations of Inequality Among Men (Second Discourse), in The First and Second Discourses, trans. Roger D. and Judith R. Masters, ed. Roger D. Masters (New York: St. Martin's, 1964), pp. 130–34; Emile; or, On Education, trans. and ed. Allan Bloom (New York: Basic Books, 1979), pp. 505–6. For accounts of the debate over this issue, see Antonio Verri, Origine delle lingue e civilità in Rousseau (Ravenna: A. Longo, Biblioteca di lettere e arti, vol. 28 1970), pp. 13–23; Robert Wokler, The Social Thought of J. J. Rousseau (New York: Garland, 1987), pp. 301-26. Derrida responds most directly to Jean Starobinski's argument that there is a contradiction between the Essay and Second Discourse (Jean-Jacques Rousseau: Transparency and Obstruction, trans. Arthur Goldhammer [Chicago: University of Chicago Press, 1988], pp. 000–000).

[50] E.g., Richard Rorty, "Deconstruction and Circumvention," in Essays on Heidegger and Others, pp. 85–106.

[51] Rousseau, Second Discourse, pp. 130–3; trans. altered.

[52] Rousseau, Second Discourse, p. 132.

[53] Rousseau, Essay, chap. IX, beginning.

[54] Rousseau, Emile, p. 000; emphasis supplied See also pp. 221 ("Pity is sweet because, in putting ourselves in the place of the one who suffers, we nevertheless feel the pleasure of not suffering as he does") and p. 235 n. ("it is in order not to suffer that I do not want him to suffer. I am interested in him for love of myself").

[55] Rousseau, Emile, p. 222.

[56] Derrida also makes much of the metaphor of "culture" used by Rousseau in the Emile to describe the education of humans relative to those of plants, claiming Rousseau seeks to understand the "natural causes of culture" (p. 223). "It is then seen how the concept of culture, in a very rare usage, unites nature and society by virtue of its metaphoricity" (p. 221). This metaphoricity points according to Derrida to a structure of supplementarity in Rousseau's text. However, Rousseau's usage is very rare indeed. What Derrida does not reveal is that the term "culture" as used here by Rousseau points to a transformation in the history of philosophy. Rousseau's analysis of the uneasy relationship between nature and civilization, with culture or cultures being civilized structures influenced in some important way by nature as it develops over history, decisively influenced later thought, from Kant through Herder to the German Romantics. Derrida's most frequently chosen dichotomy between nature and culture, as opposed to one of nature's other "others," may be revelatory of that influence as well.

[57] Cf. Locke's argument about natural law and natural right regarding suicide at the outset of the Second Treatise, in Two Treatises of Government, ed. Peter Laslett (Cambridge: Cambridge University Press, Cambridge Texts in the History of Political Thought, 1988).

The Impact of Gubernatorial Leadership on Abortion Legislation:

The Cases of Idaho, Louisiana, and Utah

by

H.E. Scruggs

Abstract

In the three years between the Webster *and* Casey *decisions, American elected officials who had for decades labeled themselves "pro-life" were forced to confront the stickier abortion related question of whether or not they were also "pro-legislation." Perhaps more than any other class of affected public officials, governors of states with legislatures inclined to pass laws limiting access to abortion felt the intense heat of controversy as they became the focus of fierce political pressure. A governor's management of this stress impacted not only the outcome of the legislative process but the substantive content of the legislative product.*

While many state legislatures addressed the abortion issue, Idaho, Louisiana, and Utah passed the strictest anti-abortion measures during this period. All three states had "pro-life" governors, all three states began with very similar legislative proposals, and the same interest groups and tactics were at work in all three states. Yet all three states experienced different legislative outcomes.

In 1990, Idaho's very restrictive bill was vetoed by the governor and the issue has not been revisited there since. After dodging the issue in 1990, Utah's more moderate 1991 legislation was quickly passed and signed into law. In 1990, the Louisiana legislature made two attempts to outlaw most abortions only to see both measures successfully vetoed. State history was made the following year when the Louisiana legislature pushed its tough law into the statute books by means of an unprecedented veto override.

The dispositive factors in determining the fate of abortion restricting legislation in these three case studies appear to have been the timing and efficacy of gubernatorial leadership influenced by whether or not the governor was of the same political party controlling the legislature.

The Impact of Gubernatorial Leadership on Abortion Legislation:

The Cases of Idaho, Louisiana, and Utah*

by
H.E. Scruggs[1]

Few events in modern history have reinvigorated American federalism--if only briefly--more than the announcement of *Webster v. Reproductive Health Services*. The battleground over abortion rights shifted instantly from national political institutions and organizations to those at the state level. While few states were untouched by the recharged abortion controversy, three--Idaho, Louisiana, and Utah--were especially hard hit.[2]

Much has been written about the politics of abortion in the post-*Webster* era, but little attention has been given to the role of governors in shaping or stopping the legislation which could have sharply restricted abortion rights and possibly precipitated a reversal of *Roe v. Wade*. In the three frenzied years between *Webster* and *Planned Parenthood of Southeastern Pennsylvania v. Casey* when many in the pro-life and pro-choice camps believed that the overturn or abandonment of *Roe* was just one or two test cases away, the leadership--or the lack thereof--provided by governors may well have been the determining factor in the battle over abortion rights.

The purpose of this paper is to explore the impact the governors of Idaho, Louisiana, and Utah had on the crafting and enactment of legislation restricting abortion. Because of the conservative tendencies, religious traditions, and the pro-life[3] reputations of their lawmakers and citizenry, all three states were natural targets for national pro-life organizations--especially the National Right to Life Committee--seeking to implement legislation designed to push the Court away from *Roe*. As Tatalovich and Daynes point out, the strength of the pro-life movement has always been in religious organizations and right-to-life committees (1981, 155). It is little wonder then that national pro-life groups descended on legislatures in three states with strong religious factions.

All three states began with very similar legislation recommended by the National Right to Life Committee. In all three states, a handful of legislators were the driving force behind the legislation, serving under the direction of the National Right to Life Committee. Many have noted the role that factors such as political culture, public opinion, and interest-group activity can play in abortion policy making (Halva-Neubauer 1989; Cohen and Barrilleaux 1992; and Tatalovich and Daynes 1981). But in Idaho, Louisiana, and Utah it was the governors' activity which helps account for the different legislative outcomes. All three governors were self-described as pro-life, and their legislatures appeared to have solid pro-life majorities. The same organizations were at work with a few activists serving as resources in all three states. However, Idaho, Louisiana, and Utah ended up with very different legislative results.

Methodology

The data for this paper were collected principally from five sources: interviews (most in person, a few over the phone), government documents and files (bills, bill drafts, legislative proceedings, letters, official messages and statements, speeches, and press releases), newspaper clippings, academic literature, and the author's first hand observations. To encourage candor, the interviews were not taped but contemporaneous notes were taken. All three states were visited, and all three governors were interviewed in person. Most of the lead sponsors of relevant legislation were interviewed as well as many of the key opponents.

Special efforts were made to interview reporters assigned to cover the state capitol since in many cases they provided institutional memory and tended to be more objective than participants about the events surrounding abortion legislation. In almost every case, any claim made in an interview or in a non-public document was confirmed in other interviews or in published media accounts.

A few of the similarities between these three states which are treated unevenly in the body of the paper, deserve some attention by way of introduction. Idaho, Utah, and Louisiana each experience reluctant leadership by their governors, the presence of legislative champions, and, at least when compared to the pro-life forces, weak pro-choice opposition.

Reluctant Leadership

When interviewed, all three governors were quick to point out that not only had they been pro-life throughout their political careers, they had actually been more hard-line than the legislation examined here. Governor Bangerter (R-UT) expresses pride in having signed legislation, but admits he would have preferred not to have been at the forefront of the abortion battle. Governor Andrus (D-ID) still claims he would have liked the legislature to pass a bill he could have signed (Andrus 1993). However, his actions, as detailed in this paper, tend to contradict that claim. Governor Roemer (D/R-LA), who was dogged by serious credibility problems during most of his single term, appeared to be the most candid in discussing the difference between his long-held pro-life position and the challenge of deciding whether or not he was also pro-legislation--"I had just never had to think it through" (Roemer 1992).

These three politicians spent most of their career in the post-*Roe* era. This was a period when it was easy to be pro-life. Those in the pro-choice camp were fairly tolerant, especially if you were of their partisan persuasion, because it was understood that the Court had placed the issue off limits. A public official could speak at pro-life rallies in the most strident terms--usually berating the Court and *Roe*--in order to win the support of anti-abortion rights activists without raising any expectations that she or he actually intended to do something about it. Pro-choicers were likely to see such rhetorical excesses as aggravating, but harmless.

In an instant, *Webster* changed all that. These three governors were unwillingly drawn into one of the great moral debates of our time. Never before had they been required to deal with the political consequences of a protracted abortion battle. They found themselves at the forefront only because they occupied positions of leadership at an inopportune time, not because any of them would have ever singled out the abortion issue for emphasis of their own accord. In fact, none of these governors had ever used the issue as a theme in any of their campaigns--including those races which immediately followed their involvement with the legislation inspired by *Webster*.

Legislative Champions

Glen Halva-Neubauer has explored the importance of representatives and senators who are committed to doing more than simply signing on to someone else's proposal.

> Legislative champions, those members willing to aggressively advocate for a proposal may be convinced to do this by interest groups or may choose to be an advocate in the legislature due to personal interest in the issue. Securing a legislative champion, rather than a person who will merely sponsor the legislation, may assist in obtaining more attention for anti-abortion legislation (Halva-Neubauer 1989, 22).

Halva-Neubauer explains that in Pennsylvania, for example, "the position abortion enjoys on the agenda . . . is directly related to the aggressive advocacy of . . . two legislators" (Halva-Neubauer 1989, 33).

In the three states under consideration, legislative champions played a crucial role in pushing abortion onto the agenda and through both chambers. They were all assisted--even instructed--by experts and activists from well-organized pro-life interest groups. Without these legislators' willingness to take the lead, it is doubtful the bills would have ever made it out of committee. In nearly every interview conducted for this study the question was asked, "What percentage of legislators would you say were committed to passing legislation restricting access to abortion?" With very few exceptions, the estimate did not exceed 15 to 20 percent. Clearly, most legislators were as reluctant as their governors to confront the new regulatory spin which *Webster* was interpreted to have on an old moral issue.

Weak Pro-Choice Opposition

For a number of demographic and historical-strategic reasons, pro-life organizations, especially local chapters of groups like the National Right to Life Committee, have long had the advantage over their pro-choice counterparts at the sub-national level (Craig and O'Brien 1993, 59-62; Rubin 1991, 245-246). This was certainly the case in the states reviewed here. In Utah and Louisiana especially, pro-choice groups were simply overwhelmed by the experience, contacts, size, and velocity of their opposition. The group Freedom Means

Choice in Idaho waged the most visible counter attack. In the end, the use and acceptance of the veto in Idaho suggests they may well have made a difference in shaping the governor's and the public's attitudes about access to abortion, but they had little observable impact on the legislative process.

The absence of emphasis in this paper on pro-choice tactics and reactions is due to the fact they were barely in the game in the subject states. Even in Idaho, the local leaders complained bitterly that national pro-choice organizations showed no interest whatsoever in the Idaho legislation until it was virtually on the governor's desk. "They weren't interested in us until the national media heated up. We had appealed for financial support but received none until the very end when the media came in. . . . They just took advantage of the national media" (Trott 1993).

Explaining the Different Results

In 1990, the Republican Idaho legislature passed a strict bill with few exemptions only to have it vetoed by the Democratic governor. In 1991, the Republican Utah legislature passed a watered-down bill which was immediately signed by the governor of the same party. Louisiana experienced a little of everything. In 1990, two bills were passed by the overwhelmingly Democratic Louisiana legislature: one which allowed abortions only to save the life of the mother and another which exempted rape and incest as well as the life of the mother. Both were vetoed by the then Democratic governor. In 1991, the legislature passed another strict anti-abortion bill and went on to override the veto by the same governor who by then had become the "only sitting governor in the twentieth century to switch from being a Democrat to a Republican" (Renwick 1992a, 49). Appendix A provides a side by side comparison of the laws passed by each of the states considered by this study.

During a two-year period, a governor of the opposite party as his legislature successfully vetoed anti-abortion legislation; a governor of the same party as his legislature signed anti-abortion legislation into law; and a governor who switched parties had his vetoes sustained when he was of the same party and overridden after he changed parties. It is the thesis of this paper that the three different results--a veto, a signed bill, and a veto overridden--can be explained largely by the leadership style and party affiliation of the governor involved.

July 3, 1989: The Post-*Webster* Era Begins

Even though government agencies were scheduled to be open, Monday, July 3, 1989 was not a day most state officials planned on working. Sandwiched between a summer weekend and Independence Day, it was a perfect opportunity for senior state employees to use a little leave time to patch together a four day vacation. But for policy makers in many states, whatever rest and relaxation the holiday might have promised was interrupted by the news that the United States Supreme Court had issued its ruling on *Webster v. Reproductive*

Health Services. Though some were not even aware that *Webster* was under consideration by the Court, before the day was through they would come to understand that a majority of the justices had issued what amounted to an invitation to state legislatures to present statutes regulating abortion to the Court for review (Wilkins 1991; Wardle 1989; Bopp 1989).

Pro-life and pro-choice activists went to work immediately in states thought likely to support restrictive anti-abortion laws. There were news conferences, requests for special sessions, demonstrations and counter-demonstrations. Legal and policy staffers scrambled to get copies of the *Webster* decision while elected officials issued non-committal responses to questions from the news media and interest groups.

By the time the Court handed down its decision in *Webster* the legislatures in many states had already adjourned for the year and in those states where they were still in session there was little enthusiasm for rushing into the abortion controversy. In addition to the lack of progress in the passage of test case legislation, 1989 also handed pro-life groups bitter gubernatorial defeats in Virginia and New Jersey.

The races in Virginia and New Jersey focused a great deal of attention on the abortion issue. Pro-choice advocates were successful in recasting the issue in terms of "who decides, you or the government?" The two pro-choice candidates won and the word spread throughout the national political community that being pro-life could cost you critical votes in a close election. With *Webster* less than six months old, momentum appeared to be shifting away from the pro-life interest groups (Craig and O'Brien 1993, 297; Rubin 1991, 249). All this served to increase pressure on the legislatures as they prepared for the 1990 session. Pro-lifers needed to shift public and media attention away from the quasi-libertarian angle of "who decides" used so effectively by pro-choicers to more favorable rhetorical grounds. They needed a win.

Idaho: The Silent Governor

By December of 1989, Right to Life of Idaho (RTLI) had, with the assistance of experts sent out by the national organization, drafted legislation that would make all "birth-control abortions" illegal. By referring to nearly all abortions not required to save the life of the mother as "birth-control abortions," pro-lifers hoped to shift national attention away from the issue of personal freedom and towards their contention that most abortions were for personal convenience rather than necessity (Sharpe 1990, B1). RTLI leaders met with supportive legislators, recruited sponsors and were well on the way to setting the agenda for the upcoming legislative session.

Kerry Uhlenkott, legislative coordinator for RTLI, mailed a copy of the proposed legislation to Governor Cecil Andrus (D) for his review and comments. In reply she received a letter that was to characterize Andrus's stance on the issue for the entire legislative session. Governor Andrus declared that he had always personally opposed abortion except in cases of

rape, incest, or threat to the life of the mother and that he had not changed. However, in commenting on *Webster* and the legislature's likely response, he left himself a lot of room.

> It is clear that the court's recent decision has given states more flexibility to tighten restrictions on abortion. I have no idea how the Idaho Legislature will react to this new situation. If and when the Legislature takes action, I will carefully consider the issues and make a decision on any change in Idaho law. I will not, however, attempt to prejudge the Legislature's actions. (Andrus 1989)

Numerous interviews and an extensive search of Idaho newspaper files not only indicate that Andrus never compromised his silent wait-and-see approach, but that those involved--activists and legislators on both sides of the issue as well as the news media--made little effort to pin Andrus down. According to several long-time Andrus observers, while the governor could be quite aggressive when it came to securing passage of bills which made up his legislative package, it was not at all unusual for him to sit quietly on the sidelines while the legislature fought over controversial matters (Montgomery 1993; Popkey 1993; Fick 1993). "I'll make up my mind when it reaches my desk," was a familiar phrase to legislators and reporters.

Karl Brooks, a pro-choice Democrat who as a member of the Idaho State Senate in 1990 helped lead the opposition to pro-life legislation, was told by aids to the governor that Andrus was studying the issue closely but did not know what he would do. They made it clear that neither the governor nor his staff would critique or otherwise participate in the drafting of pro-life legislation. Brooks was told not to "presume anything." As Brooks recalled it, "The governor knew there was going to be legislation and that it would be hot and controversial. He knew the Republicans would try to win on the issue politically, but he thought the Democrats would come out okay. He studiously steered clear" (Brooks 1993). As one Boise reporter put it, "It was vintage Andrus to let things work to his or his party's advantage" (Fick 1993). Not only did Andrus refrain from entangling himself in the drafting of abortion legislation, he made no attempt to convince legislative leadership not to deal with the issue during the 1990 session (e.g. Montgomery 1993; Popkey 1993).

Andrus's legislative preferences might have been unknown, but never in his political career did he equivocate on the issue itself. Since his election to the Idaho State Senate in 1960, Cecil Andrus has been consistently and firmly pro-life, opposing what he referred to as "abortion on demand" except in cases of rape, incest, and to save the life of the mother was well-known (Andrus 1993). The fact that serious fetal deformity was never included on his list of circumstances for which abortion should be legal combined with his activism on behalf of children with disabilities made some wonder whether or not he would sign a bill which included such an exception. While abortion had never been a major issue in any of his campaigns--in 1990 he was serving his third term as governor--Andrus acknowledges that due to his pro-life orientation "the pro-choice element" had never been of much help to him politically (Andrus 1993).

Pro-life forces interpreted his frequent re-affirmation of his opposition to abortion and his silence about their proposed bill as support. "We sent model legislation to Andrus and there was never any indication that he had a problem, never any rumblings of discontent. We expected the governor, since he was pro-life, to tell us if there was a problem," remembered Debi Roper who served on the board of RTLI at the time and was actively involved in lobbying the legislature. As a result, pro-life activists made little effort to lobby the Governor and had no direct contact with him or his office prior to or during the 1990 legislative session (Roper 1993). The same is true of the Republican legislators who were the lead sponsors of restrictive legislation. Republican Gary L. Montgomery, who served as Majority Leader in the Idaho House of Representatives and has since retired from public office, directed pro-life efforts in his chamber but never met with the governor to discuss abortion. He "couldn't recall any communication from the governor, his staff or Democratic legislators who were close to Andrus. It was clearly a hands-off approach" (Montgomery 1993).

The same was true for Representative Pam Bengson Ahrens who chaired the important State Affairs Committee which handled all abortion-related bills introduced during the 1990 session. She considers herself a moderate, pro-life Republican even though she voted against the Idaho legislation. When she learned all abortion bills would be assigned to her committee, Representative Ahrens "tried to talk to as many people as possible," including the governor's staff. In response to inquiries as to where the governor stood, she was told "he would not give any information to legislators about his position, but would wait to make his decision when it was on his desk." She recalls that "all we knew was that the Governor was in the pro-life camp from his record and his rhetoric over the years. That led a lot of people to assume that the governor would sign the bill" (Ahrens 1993).

There was a lot of assuming that session. Pro-life legislators and activists were not alarmed by the governor's avoidance and were encouraged by rumors that he had no problem with their proposed legislation. Even though several Democrats who were long-time friends of the governor actively supported pro-life legislation, no one I interviewed could or would name anyone who had explicitly discussed the bill with Andrus and received first hand feedback as to his position. According to the veteran Associated Press reporter who covers the state capitol, pro-lifers ignored Andrus (Fick 1993). This neglect would turn out to be a costly tactical error.

The near certitude by pro-lifers that the governor was in their camp was not without foundation. In addition to unwavering public statements in opposition to abortion, in 1973 Governor Andrus signed what was potentially the strictest anti-abortion law in the United States--the Idaho "trigger statute." The legislature passed a law that would be triggered by a Supreme Court reversal of *Roe v. Wade*. According to this statute, upon the proclamation of the governor that *Roe* had been overturned, abortion would be prohibited in Idaho except in cases where the life of the mother was in danger. Doctors performing non-life-saving abortions *and* the women upon whom they were performed would be subject to up to five years imprisonment (Idaho Code, §§18-613--18-615). The interplay between this statute and

the proposed legislation of 1990 was to provide an irony as bitter to pro-life Idahoans as it was sweet to pro-choicers.

Pro-life forces were not the only ones to assume Governor Andrus would sign a restrictive bill. Former Senator Karl Brooks remembers the governor's signals being "so murky and equivocal" that Brooks "had no sense of what he would sign" (Brooks 1993). It wasn't murky to another pro-choice Democrat, Senate Minority Leader Bruce Sweeney, who predicted "if any pro-life bill comes out of the House, [the Senate] will pass it and the governor will sign it" (Popkey 1990a, A1). The leader of an Idaho grassroots organization known as Freedom Means Choice which sprung up in 1990 as a reaction to the pro-life legislative activities in Idaho "had no contact with the governor's office because he had declared on numerous occasions that he was pro-life. We believed we knew where he stood on the issue. He was no ally" (Trott 1993). Similarly, Jack VanValkenburgh of the Idaho American Civil Liberties Union (ACLU) office made no attempt to meet with the governor until after the legislation had passed the House of Representatives. Instead, the group prepared to file a lawsuit in case a bill was signed into law (VanValkenburgh 1993).

That neither side of the issue mounted a focused campaign to flush Andrus out on the issue reflects an amazing ability by the governor to convince the media and those opposed to legislation restricting access to abortion that he truly was going to wait and decide upon the bill when it reached his desk, all without disturbing the confidence held by the pro-life forces that he would sign a bill if they could get it passed.

The governor made only brief mention of abortion in his 1990 State of the State address. His only specific recommendation was the repeal of the trigger statute he had signed into law nearly twenty years earlier.

> In light of the action by the United States Supreme Court, you undoubtedly will undertake discussions in the days ahead on the issue of abortion.
>
> I hope the discussions are conducted in an atmosphere of calm, reasoned deliberation. I also hope that you will revisit the issue of the so called "trigger" law, passed by the Legislature and signed by me in 1973. It is my recommendation that the section of Idaho law proscribing [sic] sentences be repealed. I offer that suggestion, hoping that it will contribute to the development of legislative consensus on this issue. (Andrus 1990a)

Other than this call for "calm" and "reasoned deliberation," there is no public record, nor is there any recollection by those involved in the Idaho abortion battle, of any utterance by Governor Andrus which might be considered leadership. His expression of hope for a "legislative consensus" on the abortion issue allowed pro-life activists to believe he would sign the results of such a consensus while pro-choice activists were left guessing. No one knew for sure what the governor would do, and no one seemed to care enough to press. As a result, legislators were on their own. For all they knew, whatever passed would go into law. The only limits were their policy preferences, their judgment as to how far the Supreme

Court would go, and the need to attract enough support from their colleagues to pass a bill. The result was House Bill 625.

HB 625

The Idaho legislature received early notice of *Webster*. The Idaho Attorney General had filed an amicus curiæ brief in support of the restrictions passed by the State of Missouri which were at issue in *Webster*. When the 1989 Idaho legislature convened, pro-choice legislators challenged the Attorney General's authority to do so without legislative approval. That March, the legislature passed an after-the-fact resolution in support of the Attorney General's action (Brooks 1993). Shortly after the decision was handed down in July, National Right to Life sent an expert to Idaho to provide legal and strategic assistance to the local chapter. By the end of the year RTLI and five legislators held a press conference to announce that a bill had been drafted for introduction in the 1990 session (Montgomery 1993).

Republican leadership organized early in an effort to keep the process under control, or in one legislator's words, "to avoid a three ring circus." Guidelines for legislation on abortion issues were published and circulated to all legislators. Since Republicans had an overwhelming (63 to 21) majority in the House and only a slim edge (23 to 19) in the Senate, all bills dealing with abortion were required to be introduced in the House where there was little chance of losing a close vote in committee (Trillhaase 1990a, A5). All abortion bills were to be introduced no later than February 12, 1990 and assigned to the House State Affairs Committee. Joint public hearings were held which drew large audiences and heavy media coverage. A committee hearing was then held where only the chief proponents and opponents were allowed to present concluding arguments (Russell 1990, B1).

Governor Andrus made no attempt to influence the legislative management of the abortion issue. He sent his staff to the hearings to gather information, not to provide any input. The hearing process was central to the strategy of pro-choice activists. They tried to communicate with the governor through the hearings since they knew his staff would be in attendance (Trott 1993). One senator described the hearings as "the parade of the law professors" (Brooks 1993) since a great deal of attention was placed on how strict a bill would be approved the Supreme Court.

The House State Affairs Committee voted to send out HB 625, an amended version of the bill drafted by RTLI, and HB 536, the repeal of the trigger statute. It was understood by most legislators that the two bills would be dealt with as a package. After all, if they were going to send a statute to the Supreme Court designed to push the justices as far as they would go in the hopes they would use it as an opportunity to reverse *Roe*, then it didn't make sense to leave the more restrictive trigger law on the books which upon the reversal of *Roe* would automatically supersede the very law the Court had been asked to uphold.

Furthermore, all the pro-choice legislators and all but the most strident pro-lifers were uncomfortable with the draconian provisions of the trigger law (Villeneuve 1990b, A1).

HB 625 prohibited all abortions "being used or sought as a method of birth control." By definition, the only abortions considered for reasons other than birth control were in cases where two physicians (one of which could not be benefitted by the fee paid for the abortion) believed that the procedure was necessary to save the life of the mother or to prevent "severe and long-lasting physical health damage" to the mother, in cases of rape "if the incident is reported within seven days," in cases of incest so long as the incident and perpetrator were "reported to a valid law enforcement agency prior to the abortion," or in situations where two physicians agreed that "the child would be born with profound and irremediable physical or mental disabilities." Criminal penalties were deleted in favor of civil penalties not to exceed $10,000. HB 625 had no penalties for women who received an abortion regardless of the reasons for which it was performed.

HB 625 was reported out of committee at the end of February and passed (47 to 36, 1 absent) a little over a week later on March 9, 1990. After a brief hearing in the Senate State Affairs Committee, the bill was passed (25 to 17) without amendment in the Senate on March 22, 1990. Minutes later, with virtually no debate, HB 536 repealing the trigger law was overwhelmingly approved by the Senate (32 to 8, 2 absent). Just the day before, HB 536 had easily passed the House (54 to 28) with very little discussion after sailing through the House State Affairs Committee (Popkey 1990c, A1; Warbis 1990).

The Idaho legislators did a remarkable job of managing the controversy and debate which always seems to attend the issue of abortion. The two public hearings held in mid-February at the Boise State University Student Union Building each attracted capacity audiences of 750 people. Over 80 people testified at the first meeting and 142 at the second. No applause, placards or demonstrations were allowed. All media reports indicate that the crowds and speakers were orderly and polite even though the rhetoric was often emotionally charged. (Trillhaase 1990b, A1; LeMay 1990, A1). Pro-life attenders and speakers were estimated to have solidly outnumbered pro-choice supporters at both hearings as well as at public rallies (Villeneuve 1990a).

Even though the legislative process was extraordinarily cordial, Idaho legislators were put on notice as to the level and intensity of local interest as early as November 12, 1989, when over 2,000 pro-choice activists marched in Boise to the State Capitol (Stuebner 1989, A1). However, the legislature had no idea how much national attention they would receive before the issue had run its course. The willingness of the fellow legislators, activists and their constituents to submit so politely to a confrontation-minimizing format may have led legislative leaders and pro-life sponsors to underestimate the firestorm they were about to unleash. Whether or not Governor Andrus foresaw the controversy that was about to engulf his state as well as his administration is unknown. His refusal to get involved appears to have been based more on instinct than on strategic calculation. With great politicians, there is often little difference between the two. Even after it had passed the House and just two days

before it passed the Senate, Andrus still refused to state his intentions. Instead, he announced his decision to run for a fourth term (Trillhaase and Loftus 1990, A1). In response to questions at his campaign kick-off press conference, Andrus was only willing to restate what was by then his well known position.

> I have always opposed legalized abortion except in cases of rape, incest and threats to the life of the mother. My views haven't changed. To speak to House Bill 625 before it reaches my desk would break a tradition long held--that I don't comment on legislation until it reaches my desk. When it arrives, I will make the proper determination at that time, but let there be no doubt in anyone's mind as to Cecil Andrus's position on abortion. (Popkey 1990b)

Around this same time the national media began to focus on Idaho. They came down in a swarm (Flag, 1990). By March 23, 1990, the day after the Idaho Senate passed HB 625, Idaho lawmakers were stunned by what they had activated. "None of us realized what a brutal experience we were in for," recalls Gary Montgomery who served as the chief House sponsor. "After twelve years in the House, I never saw an issue that approached abortion" (Montgomery 1993). Representative Pam Bengson Ahrens, who so successfully designed the process to keep the in-state controversy under control, believes legislators simply "didn't realize the unbelievable reaction" to the bill. They had "no idea it would create the environment it did. It galvanized people who had never before been a cohesive factor" (Ahrens 1993).

This was one of the perils of being the first state to fully respond to the *Webster* "invitation" for legislation. In addition to the attention Idaho received on the national evening news (and perhaps, in part, because of it), nightly pro-choice vigils at the state capitol and counter pro-life demonstrations intensified. No one in Idaho had ever seen anything like it. Then came the potato boycott. Most, including the governor, attempted to dismiss it. But Idahoans still talk about that threat with a twinge of pain. For many, it crystallized the nature of the negative national image they had created for themselves by rushing into the abortion battle.

The timing of the Senate's passage of HB 625 and the legislature's decision to adjourn *sine die* on March 30 contributed to the quick resolution of the abortion issue in Idaho. Under Idaho law, the governor has ten days to review a bill passed by the legislature. Unlike many state legislatures which have the ability to call themselves back into session if one of their bills is vetoed, Idaho's lawmakers can only be reconvened by the governor once they make the decision to go home. Therefore, if legislators really want to put pressure on a governor they can pass a bill more than ten days before they adjourn or simply wait ten days after they pass a bill to see what the governor intends to do.

In 1990, the legislature took its time getting the bill to the governor. The ten-day time limit does not start running until the bill is actually on his desk. Even though the Senate passed the bill on March 22, it did not get an engrossed copy to the governor until the

morning of March 27 (Andrus 1990). Three days later, just minutes after the legislature called an end to the 1990 session, Andrus vetoed the bill.

The coincidental if not cooperative nature of the timing mooted any talk of an override, though nearly everyone concedes that the votes were not there to do so in any case. If the Idaho legislature was really intent on passing a bill designed to challenge *Roe*, why didn't they wait to hear from the governor in order to know what kind of bill would win his signature? One is left guessing whether it was collusion, incompetence, or gross overconfidence which left HB 625 so vulnerable. In attempting to explain why so little thought was given to preserving the opportunity to override, one state senator quipped, "both sides had their own reasons for being happy" (Brooks 1993).

RTLI leaders claim they never even considered the timing of passage and adjournment an issue because they really believed they had the governor's support and because they got the bill passed as quickly as they could. The sponsors of HB 625 are convinced the governor really didn't want a pro-life bill, but they were unable to explain why they did not try to impact the timing of adjournment--especially since they had enjoyed the full cooperation of legislative leadership throughout the entire 1990 session. Former Senator Brooks suspects that by the time the national media hit Idaho, and certainly by the veto, the Republicans realized they had made a serious mistake by tying themselves and their political fortunes so tightly to the abortion issue (Brooks 1993). Governor Andrus agrees, "They were home free. Some accused me of waiting until they adjourned to veto the bill, but they couldn't get out of town fast enough. They're the ones who held it upstairs--held it to the last" (Andrus 1993).

Pro-choicers were also surprised. Jack VanValkenburgh of the Idaho ACLU went to the press conference with two news releases--one condemning Governor Andrus for not using the veto, the other praising him for his courage in using it. He happily used the latter (VanValkenburgh 1993).

On Friday afternoon, March 30, 1990, Governor Andrus vetoed HB 625. The same day, he signed HB 536 which repealed the trigger law. After controlling the agenda for the entire 82 days of legislative session, Idaho pro-lifers now not only found themselves without the statute they had hoped to take all the way to the Supreme Court, but also without the law they had long anticipated would someday kick in at *Roe*'s reversal. It was a devastating net loss.

Pro-life forces felt shocked and betrayed.

Why the Veto?

After the veto, both the governor and the sponsors of HB 625 claimed they were always willing to work with each other. Andrus asserts that the Republican dominated legislature always knew exactly where he was and what kind of bill he would sign, but that

they decided to push far beyond this comfort zone because they didn't think he would have the guts to use the veto (Andrus 1993). The legislators, on the other hand, claim that they were always willing to craft the bill to the governor's wishes. They say they knew they didn't have the votes in the Senate to override a veto so they would have been forced to follow his lead (Madsen 1993; Montgomery 1993). The fact is that neither the governor nor the legislators made any serious effort to communicate with each other during the session.

It would appear that the difference in party affiliation may account for this lack of cooperation. In addition to believing deeply in the pro-life cause, the Republican leaders and sponsors in the legislature may have been under the belief that the abortion issue was a winner with Idaho voters. Polling on abortion, always vulnerable to even benign question changes, produced mixed results throughout the Idaho experience. Again, one of the perils of being the first state involved was lack of exposure and understanding by lawmakers to the subtle distinction between pro-life voters and pro-legislation voters. Right to Life advocates continually emphasized that Idaho was pro-life. Pro-choice activists pushed data during the session indicating that a plurality opposed restrictive legislation. Polling results suggest that both were correct: the public was pro-life and anti-legislation (Associated Press 1990, A1; Miller 1990, B1).

There seems little question but that Governor Andrus could have had an impact on moderating HB 625 had he been willing to get involved early in the process, even though the claims by its sponsors that they would have shaped it to please him seem overstated. Both Senator Madsen and Representative Montgomery expressed frustration over the dominance exercised by RTLI during the session. Attempts by Montgomery to amend the bill were rebuffed by RTLI leaders (Montgomery 1993). Ironically, one of the reasons they gave was their belief that if the bill got any more liberal, the governor would veto it. RTLI's inflexibility and single-mindedness befuddled "a political system that operates best on the basis of consensus and compromise of divergent interests" (Tatalovich and Daynes 1981, 161). RTLI had difficulty keeping their coalition assembled. "We expended as much energy fighting other pro-lifers as we did fighting the pro-abortion forces," recalled one of the RTLI leaders (Roper 1993). Indeed, this seems to be the case, for as strict as HB 625 was (most experts estimated that it would outlaw over 90 percent of the abortions performed in Idaho), three pro-life groups petitioned Governor Andrus to veto the bill because the exceptions were too broad (Waters 1990).

Three years after this episode, four theories continue to float around the Idaho experience after *Webster*.

First, all individuals interviewed from the news media and several from the legislature believe that Governor Andrus never expected a bill to reach his desk. It is not unusual for such issues to take two or three years to make it through the process. It may have been that had the bill stalled, Idaho would have observed the firestorms which descended on Louisiana and Utah and thought better of taking on the issue. One problem with this theory is the very successful track record of RTLI in years past. In previous sessions, they had secured passage

of several pro-life measures--first and foremost the trigger law--on the first try. Hence, notwithstanding RTLI's difficulty in maintaining the pro-life consensus, history should have led Andrus to suspect that derailment was wishful thinking. However, RTLI's heavy-handedness and the controversial nature of the issue made many in the legislature more ambivalent than their votes might have indicated.

> I got the impression the governor and every other policy maker in the state wanted it to go away. No one had any idea how deep-seated people's opinions were. This thing took on a life of its own. Everyone realized they could not win. (Ahrens 1993)

Second, it may have been the case that Republican lawmakers were simply reckless and the Democratic governor was more than happy to let them reap the consequences. "The GOP went out on a limb," mused the ACLU's VanValkenburgh, "and the governor sawed it off" (1993). Governor Andrus is widely regarded for his political skills and many observers believe Andrus "doesn't do anything [for which] he doesn't calculate the political ramifications" (Fick 1993). Former Representative and HB 625 sponsor Montgomery credits Andrus with being a "very savvy, astute politician," though his praise was not unqualified. "Cecil Andrus professed on the surface to be pro-life. Perhaps he is, but politics was more important. He did not want to deal with abortion exclusively on the basis of what it would do to his political career" (Montgomery 1993).

It is impossible to know whether Andrus's veto was politically motivated and in conflict with his pro-life beliefs, or whether it was driven by a principled unwillingness to sign a bad bill. That the veto just happened to be coincidental to his and his party's best interest was borne out in the results of the next election. In 1990, Democrats pulled even in the state Senate (21 to 21), picked up seats in the House, and won the Attorney General's office. Most significantly, in a state that had two years earlier given George Bush a 62 percent victory, Governor Andrus easily won re-election with 68 percent of the vote (Barone and Ujifusa 1991, 340).

The third theory used to explain the veto is that it was just typical Andrus to keep options open. It was in his interest and in the state's interest for him to make his decision with the most information possible. He had the advantage of observing the storm that swamped the state after the Senate voted; the legislators did not. Even though Representative Ahrens initially believed the governor would sign a bill, she saw a decline in his resolve "as things evolved, as the governor saw what would happen to the state--the boycott, the economic impact, the cost of litigation--there was so much opposition, so many legal questions" (Ahrens 1993).

Dan Popkey, who covers the State Capitol beat for *The Idaho Statesman* is even more charitable.

> Andrus realized he had to do what he thought was best for the state. It was a hard thing for . . . a guy who has been so much of a crusader--school funding, land use planning, river protection, environmental issues. He has been a very aggressive advocate. He didn't want this one. (Popkey 1993)

Finally, Andrus may have vetoed HB 625 because he truly believed it to be a bad bill. Andrus acknowledges that he agonized over the decision to veto (Andrus 1993). It was very unusual for him to hold a controversial bill for as long as he did (Fick 1993). Even though the legislature was slow in getting him the engrossed copy, Andrus took over eight days to wrestle with the issue. While part of the delay may have been inspired by the desire to deal with the bill after the legislature had adjourned (he vetoed it just 30 minutes after lawmakers went home for the year (Associated Press 1991)), some believe that he wanted to take some time to prepare Idahoans for the veto. Each day a front page news story would come out about an additional concern Andrus had about the bill. Each day the heat on the state was turned up by vigils, protests, boycotts and national attention. And each day, as one Democratic senator observed, it became a little more clear to the Republicans that "they had not done a smart thing" (Brooks 1993).

Even seasoned political observers hedged their bets just before the veto announcement:

> Conventional political wisdom suggests Go. Cecil Andrus will sign the pro-life bill passed by the Senate on Thursday. And that view is probably correct.
>
> But Andrus has kept his options open -- and he sometimes fools the pundits who try to read his Tarot cards.
>
> Andrus, who has long been pro-life, is a gifted, thoughtful and complex politician who knows full well that pro-choice backers have been infinitely more loyal to him than pro-life supporters.
>
> The Democrat has refused to hint at his action, simply reiterating his pro-life position and saying he'll make up his mind after the bill reaches his desk. (Popkey 1990c, A1)

To this day Andrus claims he "would have been willing to sign a bill" restricting access to abortion. "I knew I would be characterized as the greatest baby killer. I would have liked them to pass a bill along my lines. I would have been prepared to sign one. I told the pro-choicers I would sign one if they passed one that agreed with my position" (Andrus 1993).

Pro-life activists offer a very different perspective. Senator Madsen reflects:

> I was brand new, I thought we were safe. Andrus never gave any indication of what he wanted. . . .
>
> It's not all his fault. We should have met with him in December. We made a mistake in assuming we had his support. And we did have his support until the

pressure got too great. It turned out his feelings on abortion were not as strong as we thought, but the pressure was much stronger. We should have had it pinned down. We thought we did. (Madsen 1993)

RTLI leader Kerry Uhlenkott is even more pointed.

Why did he remain silent? We tried to meet with him. If protecting unborn life was so important, why didn't he get involved? He was completely silent until he vetoed it.

If we hadn't felt confident [Andrus would sign] we would have made more of an effort to see him or not tried at all. (Uhlenkott 1993)

Her associate, Debi Roper, adds:

He didn't give us a clue until he started acting bizarre and distant as it became clear it was going to pass. . . . We thought the governor was satisfied with the way it was. It was too late to change, it barely made it through the way it was. (Roper 1993)

Debi Roper is not the only one to conclude that "Cecil Andrus had no intention of being the first governor to sign a bill" restricting access to abortion. If this is true--and governor Andrus is unwilling to admit it is--he could not have employed a more successful strategy. The State of Idaho healed quickly from the controversy and Andrus along with many of his Democratic colleagues went on to easily win the 1990 election. The pro-life forces were decimated in number and in spirit. The trigger law had been repealed, and they had nothing to show for their effort.

Notwithstanding the governor's post-veto offer to work with sponsors in the next session (Popkey 1990e), by 1991 no one in the legislature had any appetite for bringing the issue up again. After observing the political damage done to Republicans as a result of the Idaho abortion battle, former Representative Gary Montgomery--seen by many as "one of the primary architects" of H.B. 625--made the following observation: "I think the message is quite clear, that while a majority of Idahoans are pro-life in their personal views, they do not want to see government regulation in this area. They want that to be left as a private matter" (Associated Press 1991, 4B).

Whether or not this lesson would be lost on other states remained to be seen.

Utah: Controversy Postponed

While neither Utahns nor Idahoans like to admit it, the two states have much in common. Beyond the more obvious regional and geographic similarities, both states harken back to the same pioneer past and western spirit. The commonality is most pronounced in southeastern Idaho with its concentration of Mormons. Political phenomena hitting one state

ultimately occur in the other. As a result, whichever state experiences the trend second has the opportunity to observe and learn from the state affected first. This was partially the case in the abortion controversy.

In nearly all significant ways, the early post-*Webster* activities in Utah were indistinguishable from those in Idaho--the immediate call for legislation by activists, the influx of out-of-state experts and proposals, and the high pressure placed on legislators. Twenty-three Republican Utah representatives and senators organized "Utah Legislators for Life" and worked under the direction of the National Right To Life Committee. The content and title of the bill, *Preventing Abortion as a Method of Birth Control*, was indicative of the national organization's influence. It was virtually the same as the legislation introduced in Idaho (Sherlock 1991).

Republican Governor Norman H. Bangerter signaled his preferences well before the Court rendered its decision in *Webster*. During a March 1989 press conference, shortly after the Supreme Court heard oral arguments in *Webster*, Bangerter was asked what he would do if *Roe* was modified or reversed. After emphasizing his long-held pro-life belief, he explained that he did not intend to focus on abortion laws until after the Court issued its ruling. "This is not a special session [item]. It's something that we should handle in the normal course of business, with a full dialogue and full public scrutiny" (Bates 1989).

By mid-November 1989 the pro-life lobby and their legislative champions were circulating draft legislation prohibiting "birth control abortions." In response, Governor Bangerter attempted to slow the momentum by expressing his belief that current Utah law prohibiting the use of public money for abortions, requiring parental and spousal consent (with a judicial bypass), providing for partial informed consent, and including a general statement effectively banning abortions of viable fetuses was already as restrictive as *Webster* would allow (Rolly 1989, B5). He called for prudence. "We don't need an abortion debate right now. It is an issue that now is shedding more heat than light. I would caution that we not rush in to see how fast we can write a bill" (Rolly 1989).

In early January 1990 just prior to the start of the annual 45-day session, Governor Bangerter met separately with the legislative leadership of both parties. He explained he was not inclined to see the abortion issue handled during the session and asked for their help. The Democratic and Republican leaders indicated that they too would like to put the issue off, but feared any anti-abortion bill which made it to the floor would pass quickly. Everyone was feeling the pressure from a well organized, but relatively small, pro-life community and second guessing how the issue would play with the largely Mormon constituency.

The Mormon Factor

Utah is the most religiously homogeneous state in the nation with the predominant faith being the Church of Jesus Christ of Latter-day Saints, often known as Mormons. Roughly 70 percent of the state's population are members of this church, and Mormons have

constituted between 67 and 75 percent of the vote in Utah since 1982. Utah Mormons tend to be predominately Republican (Magleby 1989). In 1992, 86 percent of Republican voters indicated they were Mormon compared to 41 percent of Democrats (Magleby and Scruggs 1993).

Utah's unique demographics figured into Governor Bangerter's reluctance to tackle the abortion issue.

> My preference was to not have Utah be the test case because of the obvious religious overtones. I knew and many knew we would get challenged for allowing the predominant religion to dictate policy. I didn't want to be first. I hoped some other state would come forward. (Bangerter 1993)

Tatalovich and Daynes have noted that the Mormon Church has "become the most important of the non-Catholic denominations [in the pro-life movement] due . . . to their membership concentrations in sparsely populated states" (1981, 158). Witt and Moncrief have concluded:

> Given the expressed strong opposition of the Mormon church to abortion and the generally high levels of attendance and salience of religion to the LDS community, they may represent a significant deviation from the rest of the Protestant community. In fact, there is evidence that the LDS religion represents a distinct political cultural component unique from other Protestant religions. (Witt and Moncrief 1993, 143)

While the Mormon Church hierarchy made no official or unofficial pronouncements as to what course legislatures ought to follow as a result of *Webster*, their opposition to abortion was well known. On January 11, 1990 the Church's public communications office issued a statement reminding legislators and activists that "The Church of Jesus Christ of Latter-day Saints as an institution has not favored or opposed specific legislative proposals or public demonstrations concerning abortion." The same release included a restatement of the church's official position.

> The Church recognizes that there may be rare cases in which abortion may be justified--cases involving pregnancy by incest or rape; when the life or health of the woman is adjudged by competent medical authority to be in serious jeopardy; or when the fetus is known by competent medical authority to have severe defects that will not allow the baby to survive beyond birth. But these are not automatic reasons for abortion. Even in these cases, the couple should consider an abortion only after consulting with each other, and their bishop, and receiving divine confirmation through prayer. The practice of elective abortion is fundamentally contrary to the . . . commandments of the Lord. (Church of Jesus Christ of Latter-day Saints 1990)

The Mormon Church's position puts legislators in a bit of an awkward posture. The condemnation of "elective abortion" suggests that something ought to be done to curb access

to such abortions. However, even when factoring in the potentially narrowing impact of the guidance a couple might receive through prayer and consultation with a bishop (a local lay person who presides over a small congregation), any student of the abortion controversy would have to categorize the Mormon policy as constituting the far left-wing of the pro-life camp. For any exception other than to save the life of the mother is considered liberal by most of the Evangelicals and conservative Catholics who make up the leadership of the pro-life movement. In other words, the "Mormon position" is clearly pro-life, but much less clearly pro-legislation. However, Utah elected officials found themselves vulnerable to pro-life groups because they did not want to risk being branded "pro-abortion" to their constituency.

In 1990, the Utah legislature was controlled by Republicans (48-27 in the House, 22-7 in the Senate) and dominated by Mormons (Craig and O'Brien 1993, 295). The "Mormon factor" may have been part of the reason one Democratic legislative leader declared the issue a vote of conscience after predicting his party would be split on the issue "just about 50-50" (Rolly 1989).

The governor convinced legislative leadership "they were not prepared to deal with the issue since no hearings or research had been conducted" (Bangerter 1993). They agreed to hold all abortion bills in the rules committees. A threatened teachers' strike provoked by the legislature's passage of a tax cut kept both public attention and public officials focused on issues other than abortion. Sponsors of the "limiting birth control abortions" legislation were delayed from even introducing their bills (HB 446 and SB 270) until February 7, 1990. With the session limited to 45 calendar days by the Utah State Constitution, time was running out. The legislature would adjourn on February 22, 1990.

The Great Debate

Frustrated at their inability to move the legislation, the lead sponsors--Senator LeRay McAllister and Representative Pat Nix--threatened to call for a vote in each of their respective chambers to bring the bill out of the rules committees. This was no hollow threat since leadership feared that even a procedural vote cast as pro-life versus pro-choice would get away from them. An interesting twist developed on February 12. Representative Larry Lunt, a new but well-respected Republican with close ties to the governor, organized a private debate to be held in the faculty conference room of the Brigham Young University Law School. The audience was limited to a few of the sponsors of HB 466/SB 270, a couple of more moderate legislators, and members of the governor's staff. Former U.S. Assistant Solicitor General Richard Wilkins, a pro-life professor at the law school whose help had been recruited by the governor, faced off with the general counsel for the National Right to Life Committee, James Bopp, who had been flown in from Indiana especially for the meeting. By the end of the evening neither side was convinced of the other's arguments, but Wilkins[4] had managed to raise enough questions about the viability of the legislation that the next day sponsors agreed to abandon their bills in return for a joint resolution (HJR 39) expressing the sense of the legislature that abortion should "be regulated to the full extent permitted by the

United States Constitution" and established a task force to "take testimony from experts and examine the ramifications of limiting abortions."

At the end of February 1990, the Utah legislature went home having postponed the state's entry into the abortion battle. Utahns watched with interest as Idaho jumped into the fray.

Throughout 1990 the interim committee created by HJR 39, which came to be known as the abortion task force, held a series of meetings across the state taking testimony from experts and the general public. By the end of the year they had drafted a bill that was nearly as restrictive as the "birth control abortions" bill they had pushed in the previous session.

The 1991 Session

Just prior to the convening of the 1991 legislative session, Governor Bangerter, who had just announced he would not seek a third term, met once again with legislative leadership. The leaders of both parties informed the governor that due to the work of the abortion task force dominated by those who had organized themselves as Legislators for Life the year before, they could not guarantee that the legislation drafted by the task force could be held in committee. Governor Bangerter summarized the meeting as follows:

> Many of the leaders were sympathetic to my position that Utah should not be point on this issue, but they were unwilling to tackle the sponsors. They didn't want a tough bill without any room for exceptions, but they were unwilling to buck the Right to Life movement who wanted a tough bill. (Bangerter 1993)

Bangerter then met with the chief sponsors of the restrictive bill. Upon asking them if they were willing to broaden some the exceptions, he was told that they were going to introduce their bill as it was and that he could have his amendments introduced on the floor and voted up or down. The governor was not encouraged by their hardened position.

> After all those hearings they came up with a bill with practically no exceptions. They were in the driver's seat, and they could beat us on the floor. They had a non-negotiable position. They thought they could get their bill through, and so did I. We just couldn't get the sponsors to move. (Bangerter 1993)

The State of the State: A Threatened Veto

That evening in his State of the State speech, Governor Bangerter did something he had never done before as governor--he threatened a veto. As a former Speaker of the House Bangerter had always avoided coming across as a bully to his long-time friends in the legislature, many of whom had played a key role in his gubernatorial campaigns. Furthermore, he liked to keep his options open rather than boxing himself in by threatening a veto every time he was unhappy with the content of a bill. It wasn't that he never used the

veto, he just felt legislators factored that possibility into their decision-making process when they negotiated with him. Bangerter had an excellent track record getting his legislative packages enacted, and his vetoes sustained.

On January 14, 1991, Governor Bangerter spent nearly 25 percent of his State of the State address on the issue of abortion. After declaring it a matter of "deep national shame that America [was] one of the few countries in the world [that did] not recognize, to any meaningful degree, the rights of the unborn," he asked legislators to temper their zeal with two considerations. First, that the bill must contain adequate exceptions for the hard cases; and, second, that the bill be crafted in such a way as to give it a decent chance to be upheld by the Supreme Court.

He spelled out five circumstances in which women needed to have the option of an abortion--grave threat to the life of the mother, grave threat to the health of the mother, rape, incest, and serious fetal deformity. He then spelled out the need to avoid making such exceptions overly narrow.

> I realize that some will abuse these exceptions, but any system that allows for the reasonable exercise of moral agency is subject to some abuse. . . . One of the founding principles of our republic is that we do not punish those who in good faith and in good conscience make the very best decision they can. . . .
>
> There is . . . no indication that the Court is willing to accept the kind of wholesale restriction of abortion most of us would like to see. Let me spell it out -- if we pass a bill that is ruled unconstitutional, we have not saved one child, not one. (Bangerter 1991)

Before closing his remarks on abortion with an exhortation for civility, he broke his own tradition of cordiality by spelling out his readiness to use the veto.

> I am now going to something I have never before done as Governor, and I do not do it lightly. But, I must now tell you that if you pass any bill that does not meet these criteria for exceptions and requires us to advance an indefensible legal position, I will veto it. (Bangerter 1991)

At this point in the speech, the Utah legislature erupted to give the governor one of the biggest ovations of the evening. Based on their reaction, the vast majority of representatives and senators were much more comfortable with their pro-life positions than they were with the legislation they sensed was about to be forced upon them. They seemed overjoyed with Bangerter's willingness to weigh in on the issue. Legislators for Life were visibly distraught and disoriented. The very colleagues they had counted on to defeat any amendments which might be requested by the governor were on their feet applauding his straightforward attack on the abortion task force bill.

Bangerter's decision to use the threat of a veto was based in large part on his confidence that without his involvement, an overly strict bill would pass, and he would then find himself in a very uncomfortable position.

> If I would have stayed out of it, I would have received a bill that was unacceptable, but since I am pro-life it would be difficult for me to veto a piece of legislation with which I was sympathetic, though my veto threat would have made that easier. Utah was going to pass a bill; I wanted a bill I was comfortable defending. People are entitled to know where the governor stands.
>
> I told them what I wanted, and they gave it to me. (Bangerter 1993)

It was not quite that easy. But international events were about to give Governor Bangerter an edge he had not anticipated.

Under Cover of War

Forty-eight hours after his State of the State, while the stunned hard core pro-life legislators were still trying to re-assemble their coalition and decide whether or not to call the governor's bluff, the United States began the air war against Iraq (Barron 1991, A1). The next morning a delegation of the pro-life champions requested an emergency meeting with the governor. The legislators believed that by dealing with abortion under the cover of war, Utah could avoid the kind of national attention which had so tormented Idaho the year before. They had come back to the table to present a novel proposition--a "two-tier" bill.

They made the argument that since the governor's primary objection to their more stringent bill was his belief that it would not pass Supreme Court muster, the best compromise was to construct legislation in two parts. The first part or "tier" would be the National Right to Life Committee version which provided exceptions for the life of the mother, incest and rape (if promptly reported), and profound and irremediable health threats to the mother or the fetus. The second part or tier would be determined by the governor but would only go into effect if the Supreme Court struck down the first tier.

This device was thought to give Utah two bites at the Supreme Court apple. If the Court rejected the stricter approach, an experimental "savings clause" would allow them to then review the second tier. The staunch pro-lifers saw this as a huge compromise since they believed the Court would be more likely to strike down their version if the Justices could see a more moderate set of restrictions already in place as a statutory backup.

It was at this point that all the negotiating advantages appeared to be shifting in Bangerter's direction. First, as a lame duck he had much more modest political concerns than most of the legislators. This is not to say he was politically carefree. Due to public anger over a tax increase he had requested during his first term, Bangerter had won re-election in a three-way race with just over 40 percent of the vote. In 1988 his popularity hit rock bottom.

Even though he would not be seeking any office in 1992, he did want to regain his standing with the public in order to leave office on a high note.

Bangerter's second advantage was that he had witnessed the Idaho experience. His friend and fellow pro-life governor Cecil Andrus had vetoed a bill which had been portrayed as extreme and had not only escaped any dire political consequences, both he and his political party appeared to have flourished after the veto.

The third advantage was that both the National Right to Life staffers and their cooperative Utah legislators were also intimately aware of the Idaho experience.

The fourth advantage was that the sponsors wanted something to happen quickly while the national attention was still riveted on Desert Storm. By so doing, they could minimize the political risk to themselves and their supporters. Yet they could only accomplish this with Bangerter's cooperation. Central to Andrus's escape was his willingness to uncharacteristically delay signing the bill for eight days while the legislation sizzled under the national media's magnifying glass. The sponsor's war-time strategy could only work if Bangerter would sign immediately.

Finally, Bangerter's veto threat had stiffened the resolve of moderate Republicans and pro-life Democrats. They had confidence that if an overly restrictive bill passed, the governor's veto would not leave them as vulnerable to "pro-abortion" perceptions and attacks.

All this added up to a vivid realization by Legislators for Life that they could very well come away from the 1991 session empty-handed. Again looking to Idaho they could see that after a controversial bill had been vetoed there, even the strongest pro-life legislators--those who had not been defeated in 1990--were unwilling to raise the abortion issue in any way, shape or form (Associated Press 1991). It appeared that 1991 might not only be their best chance at passing something, but their only chance.

SB 23

In a little over a week SB 23, the bill drafted in part by the National Right to Life Committee and in part by the governor's office, was the subject of two public hearings and then passed quickly in the Senate (23 to 4, 2 absent). When it reached the House, Bangerter encouraged moderate Republicans and pro-life Democrats to strip the entire first tier out of the bill, leaving only the less restrictive portion to be returned to the Senate for concurrence. The pro-life lobbyists were outraged, but by then they had lost control of the process. The following day, over the objections of the bill's chief sponsor, this considerably more liberal version quickly passed. The bill was signed by the governor later that day.

With over two-thirds of the 1991 legislative session remaining, the governor and legislature had pushed through an abortion bill. Even though the Scud and Patriot missiles

were still flying when the legislature moved on to other issues, Utah still took a national beating for leading the way. The haste with which the process was handled exacerbated the negative publicity--six technical corrections were necessary during a special session called for that purpose.

This bill was quickly pegged as the most restrictive abortion law in America. Just as quickly, the legislation was repudiated by the National Right to Life Committee.

> . . . [U]nder the amendments adopted to this law just before its final passage, which were strenuously opposed by Right to Life of Utah, abortion is legal whenever an abortionist says that it would avert "grave damage to the pregnant woman's medical health." The intent of the new language was explicitly to include "mental health" reasons for an abortion, and those who perform abortions have long openly claimed that having any "unwanted child" would pose grave damage to a mother's mental health.
>
> Thus, the language is subject to abuse. Therefore, we will oppose enactment of such language in any other state. (National Right to Life Committee 1991)

The fact that both sides condemned the Utah legislation may give some validity to Governor Bangerter's claim that the legislation was a "mainstream attempt to protect the sanctity of life without trampling on the legitimate liberty interests of women" and that it had "virtually nothing in common with the highly publicized attempts to restrict abortion in" Idaho and Louisiana (Bangerter 1991).[5]

Louisiana: Overriding Concerns

Nothing is better than a trip to Louisiana to make a pro-lifer from Idaho or Utah feel progressive. By nearly every measurement--political culture (Elazar 1966), demographic make up of the legislature and general population (Day 1992), existence of a civil law tradition, and legislative experience with abortion--no state in America was more pro-life or more pro-legislation.

While this combination may make gubernatorial leadership on the issue nearly impossible, it also makes it absolutely critical. Perhaps more than any other governor in the nation, Charles Elson "Buddy" Roemer III struggled not only with his legislature, but also with his own personal beliefs on the abortion issue. Given the "uncertain sounds" coming from the governor's office, it is no wonder that those who might have worked to moderate Louisiana's response to *Webster* were singularly unprepared for the battle.

Just days after the Court announced *Webster*, the Louisiana legislature called for the immediate enforcement of its pre-*Roe* laws. Legal impediments prevented that action from ever having any practical effect, but the first shot had been fired. Everyone who followed the issue was aware of what was ahead. Former Governor Roemer recalls:

> The were dark clouds on the western horizon, I knew we were going to have a storm. A couple of legislators came to see me saying, "we could be the first." I told them the same thing I told everybody, "I've got to do some study." They wanted me to use a special session. I told them I was not willing to move that fast, being right was more important that being first. If any issue needed time to cure it was this one. (Roemer 1992)

Like Andrus and Bangerter, Roemer had a long pro-life political record. As a Member of Congress, he consistently opposed federal funding for abortion and favored a constitutional ban of abortions (Shogan 1990, A16). Abortion had never been an issue in any of his congressional campaigns nor in his darkhorse defeat of the previous governor Edwin Edwards. By his own admission, he had "never had to think [the issue of abortion] through" prior to the announcement of *Webster* (Roemer 1993).

Without detracting from Louisiana's unique contribution to the American political landscape that chroniclers of the state's government and politics delight in highlighting (Barone and Ujifusa 1991, 500; Day 1992; Renwick 1992), it should be pointed out that Louisiana's participation in the post-*Webster* controversy had much in common with that experienced by Idaho and Utah. In addition to the presence of a self-described pro-life governor, Louisiana also had strong religious factions (Catholic and Fundamentalist Christian), significant involvement by the National Right to Life Committee, and a legislature dominated by one party--the Democrats controlled the Senate 33 to 6, and the House 86 to 18 plus 1 independent (Barone and Ujifusa 1991, 507). While all of these dynamics had a distinctive Louisiana flavor, the most pronounced variation of the shared characteristics was the degree to which pro-choice groups were routed by pro-life forces both in and out of the legislature. One media account summarized the situation by describing "pro-choice lobbyists either voluntarily retreating in the face of overwhelming odds, or being deliberately hampered by state officials" (Ruth in Day 1992, 6).

1990: Two Roemer Vetoes Hold

In an excellent account and analysis of the post-*Webster* Louisiana abortion episode, Professor Christine L. Day found:

> Many Louisiana legislators themselves, in a legislature that is half Catholic and over one-third fundamentalist Protestant, are committed advocates of anti-abortion legislation. Legislative champions of the anti-abortion bills have been highly visible and vocal. The major conflict with the legislature is not over whether to pass anti-abortion legislation, but whether to include exceptions for rape and incest. (1992, 7)

This dispute was certainly at the center of 1990 legislative activities. The legislature passed two very restrictive bills that year, both of which were vetoed by Governor Roemer. The first, HB 1637, was barely over a page long and criminalized all abortions except those necessary to save the life a mother. It passed the House 78 to 27, and the Senate 24 to 15. In

his veto message Governor Roemer declared that while for most of his political career the only exception he had supported was saving the life of the mother, after years of struggle he had become aware "of the need to except those instances where conception occurred because of rape or incest." He told the legislature that prior to the session, he had indicated that he would not allow any legislation to go into law which did not contain these exceptions.

This is a matter of some dispute. The chief sponsor of HB 1637, Representative Woody Jenkins, had been a close friend of Roemer's, he had endorsed him in his 1987 gubernatorial campaign and served on the transition team. Jenkins claims that Roemer would not talk to him during the session (Jenkins 1992). Former Senator Allen R. Bares recalls "there was always a little confusion at to where he stood on the issue" (Bares 1992). Those who followed the issue for the news media tend to back up claims that Roemer did not reveal his policy preferences or requirements. Jack Wardlaw, a veteran Baton Rouge reporter, recalls that the governor "never would make his policy position clear to either side" (1992).

Regardless of whether or not Roemer had explicitly staked out his position prior to the 1990 session, he admits he had changed his mind by the end of the session.

> I told them I needed three exceptions--rape, incest, and life of the mother--and that I would watch the debate and learn from it if it was honest. I told them I would observe and report any changes. [After watching] I was getting further away on the issue, less comfortable with legislation. (Roemer 1992)

It is not evident that Roemer ever shared his growing ambivalence with anyone in the legislature. "He had a habit," observed his former ally Allen Bares, "of changing his mind without conveying it" (Bares 1992). This habit would lead to charges of deception discussed later.

Roemer's Refusal to Lobby

The most startling manifestation of Roemer's ambivalence was his unwillingness to either publicly rally support or privately lobby legislators in defense of his veto. This passive strategy was to become the trademark of his leadership on the issue. An attempt to override Roemer's veto of HB 1637 failed in the Senate by six votes, but succeeded in the House. It was the first time in the twentieth century that either house had voted to override the governor in a state where 50 to 60 bills a year are usually vetoed (Roemer 1992; Jenkins 1992).

The President of the Senate, Sammy Nunez, appears to have played a key role in sustaining the veto even though he was not considered part of the Roemer team. Senator Nunez, a strong support of the previous governor Edwin Edwards, had been ousted as President of the Senate by another senator backed by Governor Roemer, Allen Bares (Nunez 1992; Renwick 1992, 11-13). Roemer's popularity began to dip, in part a result of a controversial fiscal package which had been largely rejected by Louisiana voters in the 1989

election. His control of the legislature began to slip as well. Senator Nunez defeated Bares when the Senate reorganized for the 1990 session (Renwick 1992, 11; Crum 1991, 102). In spite of the enmity between Nunez and Roemer, the President of the Senate managed to exercise some party discipline on the Governor's behalf--five senators who had voted for HB 1637 switched their votes to sustain the veto.

With time running out in the session, legislators scrambled to find a way to get the governor an anti-abortion bill he could sign. In two days they gutted a bill, HB 1331--which had originally been introduced to discourage flag burning--and substituted in its place language restricting abortions except in cases of rape, incest, and to save the life of the mother. It passed the Senate (32 to 7) and the House (83 to 22) just in time to adjourn.

Roemer vetoed the bill on the grounds that the exception for rape was too narrowly drawn, the criminal liability sloppily drafted and that the two-day harried process used to graft the measure on to a flag burning bill was an affront the legislative process. He reiterated his willingness *not* to veto a bill that broadly excepted rape, incest and for the life of the mother. He sent out his veto message and went fishing in Wyoming.

The Louisiana legislature can call themselves back into session to override a veto exercised after adjournment if members mail in enough written ballots indicating their desire to do so. Consistent with his surprisingly aloof approach to the issue, even though HB 1331 had passed with "veto proof" majorities in the Senate and the House, Roemer made no effort to convince legislators to reverse their votes and sustain his veto. Before he left town he recalls telling legislators, "You have a chance [to override me]. I'm out of town, don't call me" (Roemer 1992). However unconventional, the strategy worked--an insufficient number of ballots were mailed in to reconvene. The 1990 legislature officially drew to a close without successfully passing abortion legislation. Other than his veto stamp, Roemer appears to have reached this result without using any other tool of legislative leadership.

In reflecting upon his experience with abortion legislation shortly after the 1990 session, Governor Roemer began to publicly wonder whether federalism was an appropriate means of dealing with the abortion issue. "This may be one of those issues that are best served not locality by locality but on a national basis" (Shogan 1990, A16). By the end of the 1991 session Roemer's feelings on this subject had no doubt solidified.

1991: The Historic Override

Pressure to pass a strict law limiting abortions was mounting. Right to Life leaders, Catholic Bishops, and fundamentalist preachers pressed legislators to get the job done. Even though the Louisiana Legislature has an unusually high percentage of members willing to go to the mat for the pro-life cause, nearly every interview suggested that only about 20 percent of the legislators truly wanted to deal with the issue. Senator Nunez, who had arguably done more than any other legislator to prevent passage of pro-life bills in 1990, was feeling the heat. "Many legislators leaned pro-choice but felt like they had to vote for [pro-life bills]

because of heavy Catholic or Evangelical support" (Nunez 1992). Senator Nunez knew what he was talking about; during the interim 87 percent of those living in his home parish--including his mother--signed a petition in favor of pro-life legislation (Bartlett 1992).

In late December 1990, Roemer met with the Louisiana Catholic Bishops to tell them he wanted to "honor women as well as protect the unborn" (Roemer 1992). The Bishops left the meeting with the understanding they had received Roemer's commitment to support a strict pro-life bill (Theriot 1992). He then met with fundamentalist leaders. Roemer recalls asking them if there was any way they could avoid a "knock down, drag out fight that [he] might win?" Roemer was told such a battle could not be avoided in 1991 (Roemer 1992).

Roemer Changes His Party and His Mind

Priests and preachers were not the only ones who worried about Governor Roemer's soul in the weeks and months preceding the 1991 legislative session. Many legislators also believed Roemer had just committed two political cardinal sins: he switched parties (in March of 1991 (Barone and Ujifusa 1993, 531)), and (so they say) he lied.

While it is not my purpose to try to explain Roemer's decision to change political parties, it is sufficient to note that his reformist programs had met with such limited support, and his leadership style had aggravated so many in the legislature and the Democratic party generally, that he might have felt that his political base had eroded to the point he was better off running against it than with it. Some have suggested that he might have also had his eye on national political office where the Republican tag suited him better (Nunez 1992; Theriot 1992). Whether the political motivations were local or national, many legislators were beginning to suspect that Roemer had decided to run against the legislature and was not above using, among other issues, a veto of abortion legislation to draw attention to his campaign themes (Nunez 1992; Theriot 1992). Whatever the political strategy behind the switch, it did not help him mitigate the approaching abortion controversy. Clearly, it further undercut his already sinking credibility.

According to one media observer, Roemer developed the reputation early in his administration for "broken promises, inflated claims, and even lies . . . he often tells people what they want to hear and then forgets about it. In recounting his achievements, he frequently overstates them" (Kelso in Renwick 1992, 14). With the exception of the word "lies," a variation of the just quoted description has been used at one time or another to describe every elected official in America. But as rough and tumble as contemporary politics has become, accusing an opponent of lying is still a serious matter. Nevertheless, legislators interviewed for this paper were unabashed in their references to Governor Buddy Roemer as a liar (Nunez 1992; Jenkins 1992; Theriot 1992). Sponsors of HB 112 were especially aggravated with what they believed was Roemer's intentional deception regarding his willingness to let any piece of restrictive abortion legislation pass into law.

HB 112

When the Louisiana Legislature reconvened in 1991 abortion was at the top of the agenda. HB 112, a bill very similar to the second anti-abortion bill passed the previous year (narrow exceptions for rape, incest, and life of the mother), had been pre-filed by two long-time Roemer allies, Senator Allen Bares and Representative Sam Theriot. Together, with the active support of Senate President Nunez, they managed to hold off a fundamentalist Christian backed effort to a push through a stricter version which included only the life-of-the-mother exception. Demonstrating the limits of contemporary political labeling, those backing the stricter bill held a press conference to attack HB 112 as a "pro-choice" bill (Redman 1991, B11).

Representative Theriot sent a draft of HB 112 to the National Right to Life Committee and received word back that the group had given its approval of the proposed language (Theriot 1992). In addition to holding off what they referred to as the "ultra pro-life" wing of the legislature, Theriot and Bares put together a coalition of Catholics, local Right to Life leaders, and legislators to support a bill with the three exceptions (Anderson 1991a, B6). While a number of their colleagues simply wanted to see something pass so the issue would go away, many in the coalition would have preferred the stricter bill. Their willingness to hold their noses and support what Theriot called "the ultimate compromise bill" was based on two strategic considerations. First, the coalition believed that Governor Roemer would definitely veto a bill without all three exceptions; and, second, the single exception bill had not received a veto-proof victory margin in 1990. They were convinced the multiple exceptions approach was the only way to either avoid a veto or override one (Bares 1992; Theriot 1992).

In an effort to gain Buddy Roemer's support, Bares and Theriot went to great lengths to communicate with the governor and to receive his input (1992). The contents of HB 112 were provided to Roemer and his staff prior to the commencement of the legislative session. Roemer allegedly refused to tell the legislators what he would or wouldn't sign (Redman 1991, B11; Bares 1992). At a May press conference Roemer hedged by saying he was encouraged by the direction the Bares/Theriot bill was heading, but was waiting to study the details even though entire bill had been available for review for over a month (Myers 1991a, 1B; Anderson 1991, A1). Interestingly, while Bares expressed frustration with Roemer's silence, Theriot was convinced Roemer was actively supporting the bill through his close friend and ally, then Speaker of the House Jimmy Dimos.

> In August of 1990 I was invited to meet with Speaker Dimos [where] I was asked to handle the exceptions bill. I was told it was backed by leadership and the governor. After the bill was reviewed by National Right to Life, I gave the bill to Dimos. He told me the governor approved and that he wanted me to handle it. (Theriot 1992)

On May 13, HB 112 passed the House (72 to 31) and less than one month later, it passed the Senate (29 to 9). It was not until the bill was on the senate floor that Roemer made any effort to suggest improvements through his floor leader Senator Sydney Nelson--exceptions for tubal pregnancies, grave fetal deformity, extended periods for examination and reporting of rape victims, and serious threats to the physical and mental health of the mother (Bares 1992; Theriot 1992; Myers 1991b, A1; Myers 1991c, A1). All of his requests were soundly defeated (Suro 1991a, A9). Either by design or by default, Governor Roemer had waited far too long to weigh in on the issue.

After reviewing the bill for two weeks, Governor Roemer used his veto power once again. He defended his veto on much the same basis he had a year earlier, but instead of criticizing the legislature for rushing it through at the last minute, he complained that they had not been receptive of his proffered amendments, most of which he had not raised earlier in the process (Aynesworth 1991, A4). On June 18, 1991, the day the veto message was read in both chambers, it was immediately overridden. The House, which had always been the more resolute on the issue, overrode with six votes to spare (76 to 25) and the Senate did likewise with a three vote margin (29 to 9) (Suro 1991b, A1). Several have suggested that at least part of the motivation for the override was political--a chance to take a jab at a party-switching, mind-changing governor on the political ropes whose use of the veto had prolonged the abortion controversy by one whole year (Gomez 1992; Nunez 1992; Wardlaw 1992; Theriot 1992).

It was the first veto override in Louisiana during the twentieth century, and possibly in the history of the state (Wardlaw 1991, B5; Suro 1991b, A1; Renwick 1992a, 12). Louisiana was the proud parent of the strictest abortion law in America.

Passive Resistance

Sponsors Theriot and Bares, as well as President Nunez, believed that if the governor would have really gone to work early in the session, there would have been a chance he could have blocked the legislation (1992). Governor Roemer never made much of an effort (Nicholas and Anderson 1991, A1). He told Senator Bares, "I'll do my job the best I can, if you override me, no hard feelings" (Bares 1992). One pro-choice lobbyist recalls his passive role.

> Roemer refused to lobby on this issue--but then he refused to lobby on any issue. He'd abdicated his role as a power broker/legislative leader. . . . He didn't want the anti-choice bill on his conscience, but he did very little to sustain his veto. (Brylski 1992).

Terri Bartlett, director of the New Orleans Planned Parenthood office and active lobbyist against the pro-life measure, remembers Roemer making a few phone calls, but "when he announced he wasn't going to give out any [government] projects, we knew it was unraveling" (1992).

Governor Roemer was not at all inclined to deal.

> It was an issue of moral judgment, not a member came to trade votes. [I was] open to talk to anyone, but no trading. It came down to my personal opinion, what if I'm wrong. I might have done some trading on an appropriations bill--that's just money--these [the unborn] are people. I told them, do what you think is right, you have to live with it. (Roemer 1992)

Political Impact

Governor Roemer dismissed the political consequences of the override, "This is not about votes. This is about unborn babies. This is about women who have been brutalized by rape. This is about a country that is trying to get it right. We still don't have it right" (Suro 1991a, A9; Hill 1991).

Even though it is extremely difficult to think of any political upside to Governor Roemer's management of the abortion controversy, only the most strident pro-lifers attempt to tie Roemer's third place finish in the gubernatorial primary--he finished behind Edwin Edwards and David Duke--directly to the veto. Most involved either as participants in or observers of Louisiana politics believe that the abortion controversy was mostly symbolic of Roemer's major political liability--failed leadership (Renwick 1992a, 12; Renwick 1992b).

The United States Supreme Court declined to consider Louisiana's appeal from the ruling of the Fifth Circuit Court of Appeals that HB 112 was unconstitutional.

Conclusion

The claims of this paper are modest. These three case studies reveal that in the high pressure arena of abortion politics, gubernatorial leadership matters.

Studies of governors' use of the veto have produced little in the way of generally applicable predictive or explicative patterns--the content of the bill in question and the position of the governor on that bill in relation to the legislature are the key determinants. Vetoes are anomalies (Herzik and Wiggins 1989, 855-856).

Similarly, the abortion issue itself depends upon so many state-based variables that each case produces conclusions which can only be gingerly applied elsewhere. For example, partisanship was significant in predicting legislative voting behavior in Idaho (Witt and Moncrief 1993, 145), of only marginal use in Utah (Rolly 1989, B5; Sherlock 1991, 87), and not at all important in Louisiana (Day 1992, 12). Legislative reaction to abortion bills is also anomalous (Witt and Moncrief 1993, 141).

Hence, this study, this collection of anomalies--the veto, abortion legislation, states, and governors--is necessarily limited in general application. However, a few lessons about gubernatorial management of high controversy issues on which governors profess to agree with the legislature seem to take shape when the experiences of the three states are looked at side by side by side.

Idaho suggests that when the governor is of a different party than the legislature, strength and silence make an effective combination. Reminding the legislature and the general public that the decision on a controversial measure will be made when it hits the governor's desk, keeps the pressure on the legislature to produce a defensible work product.

Utah suggests that when the governor is of the same party as the legislature, there is safety in strength and articulation. Through speaking out early--by exercising leadership--the governor minimizes the chances of being held responsible for a reckless legislative decision.

Louisiana demonstrates the danger of weak and inarticulate leadership by a governor who has allowed a hostile relationship to develop with the legislature. There is no safety in attacking an institution for which a governor has some presumptive leadership responsibility.

One of the most interesting spectacles found in these case studies was the education governors received on the difference between professing a pro-life position and actually enacting laws that would codify and enforce that position. *Webster* required governors, legislators and voters to decide if they were sufficiently pro-life to be pro-legislation. Gubernatorial leadership was all that separated overwhelmed state legislatures from the equally overwhelmed courts. The meager results of that leadership--at least in Louisiana's case and perhaps in Utah's as well--might explain why the Court in *Casey* decided three years of federalism on the issue of abortion was enough. Complaints from governors and legislators about *Casey* closing the post-*Webster* era have been scarce.

Finally, while much has been written about the "post-*Webster*" era, few have taken notice of its end. The *Casey* decision reaffirmed the Court's commitment to *Roe* in terms that may have been ambiguous to a few activists, but not to state legislatures which seem to have clearly understood that any attempt to regulate abortion beyond relatively minor procedural requirements will be struck down as unduly burdensome. Most pro-life groups have little interest in pushing for such modest restrictions and even fewer legislators will want to consider proposals likely to result in costly litigation and controversial national attention. Even states like Idaho, Utah, and Louisiana have gotten the message.

The election of Bill Clinton to the presidency followed by the appointment of pro-choice Judge Ruth Bader Ginsberg to the Supreme Court punctuates the conclusion of the federalist interlude wherein states were led to believe that the reversal of *Roe* was just one restrictive statute away. The three year period between July 3, 1989 and June 29, 1992--which, in the interest of accuracy, ought now be referred to as the post-*Webster*/pre-*Casey* era until some snappier title is devised--exposed the governors and legislators of Idaho, Louisiana, and Utah to unprecedented pressure and controversy. Perhaps that is why they appear to be among the happiest that this era is over.

Endnotes

* Research support for this paper was provided by the College of Family, Home and Social Science, and the Department of Political Science, Brigham Young University. Special thanks to Brant Bishop for his thoughtful and tireless help. Research assistance for this paper was also provided by Matt Fairholm and Jon Mott. As always, my colleagues have been patient and helpful.

1. Prior to coming to Brigham Young University in 1991 as a visiting member of the political science faculty, I served as Chief of Staff to the governor of Utah. Much of the information about the Utah legislation is based on first-hand observations.

2. In 1991, the North Dakota legislature passed a bill very similar to Idaho's which was quickly vetoed by the governor. The governor of Florida called a special session to deal with abortion restricting legislation but went away empty handed. The Pennsylvania legislation which lead to *Casey*, dealt with procedural obstacles--informed consent, notification, and waiting periods--rather than the stricter approach of defining reasons for which an abortion would be allowed. In 1990, the territory of Guam passed very restrictive legislation which was later ruled unconstitutional by the federal courts. One study reported that in the first year after *Webster*, state legislatures introduced 507 bills addressing abortion rights of which 431 were pro-life, and that in the second year after *Webster* 184 out of 241 bills introduced were pro-life (Price 1991 A3). Another report indicated that in 1991 more "than 200 bills [were] introduced in 45 legislatures" (Schwartz 1991, A4).

3. While it is doubtful that anyone reading this paper is unaware of the connotations of the words "pro-life" and "pro-choice," there appears to be a tradition of tedious endnotes disclaiming usage of these very common terms. These are the labels used by the groups to identify themselves and by the news media. Those who quibble about titles on this subject tend to do so for political rather than editorial reasons.

In researching this paper it has been my experience that the majority of activists in the pro-life movement favor the prohibition of all abortions except to save the life of the mother. Additional exceptions for cases of rape, incest, serious fatal deformity and grave but not life-threatening injury to the health of the mother appear only to be tolerated to the degree necessary to build political support. On the other hand, pro-choice activists oppose any restriction on access to abortion, including economic. The legislative activity of both sides since *Webster* suggests that these absolutist positions are true policy preferences rather than merely beginning postures from which negotiation can begin.

This may be the logical place to qualify one other term used commonly in this paper and in the relevant literature--"strict." Given their ideological moorings and resultant policy preferences, the word strict often loses its meaning when used by either side in the abortion debate. To most politically active pro-lifers, no legislation with exceptions beyond saving the life of the mother would ever be considered strict. Yet statutes which require only informed

consent and a waiting period while making no restrictions on the timing or motivation for the abortion are routinely referred to as strict by pro-choice activists and the media. The words "strict" and "restrictive" in this paper are used to indicate the degree to which a woman's reason for seeking the abortion impact her ability to legally have one.

4. Interestingly, Richard Wilkins was also to become a central figure in the Idaho legislation. At the completion of the Utah legislative session, Governor Bangerter called Governor Andrus to recommend Wilkins as a possible resource. Andrus declined, telling Bangerter, "No thanks, I'm going to sit this one out" (Bangerter 1993). Wilkins was contacted by pro-choice legislators in Idaho and became one of the lead witnesses against the Idaho bill. Andrus contacted Wilkins when the bill reached his desk and cited his advice as one of the reasons for vetoing the bill (Popkey 1990d; Miller 1990, 3A). Ironically, Wilkins--the pro-life law professor who as U.S. Assistant Solicitor General wrote the appellate brief for the Missouri legislature in *Webster*--ended up as a key player in the veto of the Idaho legislation and the derailing of the 1990 effort in Utah. In 1991 he was the architect of the legislation which passed the legislature and was signed by the governor.

5. Upon signing SB 23, Governor Bangerter indicated that the State would cooperate with an injunction preventing the law's enforcement until it had been reviewed and upheld by the United States Supreme Court. Eighteen months later, shortly after *Casey* was handed down, the governor announced the state would drop its defense in U.S. District Court of the proposed ban on what came to be called "elective abortions."

Appendix A: State by state comparison of abortion legislation

	Louisiana	Idaho	Utah
Findings/ legislative intent	Compelling interest to protect life from conception; life begins at conception	Abortion is often used as birth control.	Unborn children have inalienable rights to be balanced against the woman's liberty interest
Criminal penalties--doctor	1 - 10 years; $1,000 - 10,000	none	to 5 years; to $5,000
Criminal penalties--woman/other	none	none	none
Civil penalties--doctor	none	to $10,000 (1st offense), $30,000 (2nd), $50,000 (additional offenses); 3 x damages sustained + punitive	none
Civil penalties--woman	none	none	none
Rape exemption	yes	yes	yes
Rape--reporting requirements	exam within 5 days; report crime within 7 days	report crime within 7 days	report crime prior to abortion
Incest exemption	yes	yes	yes
Incest--reporting requirements	reported w/in 13 weeks	reported prior to abortion (including offending relative)	reported prior to abortion
Mother's health exemption	none	yes, for physical health only	yes, for "grave damage to medical health," including mental health
Health exemption determined by	n/a	attending physician and other non-interested physician	attending physician
Mother's life exemption	yes	yes	yes
Life exemption determined by	attending physician	attending physician and other non-interested physician	attending physician
Fetal deformity exemption	only for dead unborn child	yes, with agreement of attending and second physician for profound and irremediable defects	yes, for grave defects
Waiting period	none	24 hours	none
Timing restrictions	not allowed if fetus is viable	within 13 weeks for rape and incest	within 20 weeks for rape; in hospital if 90 days after conception

Domain Specificity in the Effects of Political Events On Preadult Socialization[1]

David O. Sears

Nicholas A. Valentino

Rick Kosterman

University of California, Los Angeles

August 24, 1993 (8)

Paper prepared for presentation at the annual meeting of the American Political Science Association, Washington, D.C., September 1, 1993.

Abstract

The goal of this study was to test the domain-specificity of the politically-socializing effects of major political events. The basic hypothesis was that preadult children would show increases in the affective strength of their predispositions (as indexed by the consistency, stability, and power of those attitudes) only with respect to the attitude objects most central to the public communication about the event. The data came from a panel study of preadults and adults during and after the 1980 presidential campaign. That campaign generated substantial increases in the crystallization of preadults' candidate evaluations and party identification, presumably the domains most emphasized in campaign communication. Lesser gains were observed, and more uniformly across adults and children, and across the pre- and post-campaign phases, in ideology and the central issues of the campaign; the implication is that the campaign played little socializing role in these domains. Attitudes regarding issues not discussed much in the campaign did not change. The main implication is that political socialization proceeds by fits and starts rather than incrementally, and political events play a major role in stimulating the communication that provides the "start," but only toward the most salient attitude objects (i.e., in the domains bearing most communication about the event).

Empirically-based theory on mass political behavior has been marked by a continuing debate between those influenced by neoclassical economics and those who are more psychologically oriented. The debate revolves most centrally around the extent to which homo politicus makes political choices "rationally" on the basis of available information, or is subject to a wide variety of distorting psychological influences. It is a central issue in democratic theory, which rests heavily on presuppositions about human nature.

One major empirical dispute concerns the long-term stability and impact of basic political predispositions. Highly stable predispositions are, presumably, relatively impervious to the realities of the contemporary environment, and if they dominate political choices, they present an obstacle to fully "rational" decisions based on the merits of currently available alternatives.

This dispute has generated three empirical literatures. Early theories of voting behavior (e.g., Campbell, et al., 1960) argued that party identification, acquired early in life and highly stable thereafter, played the single most important role in voting behavior. In contrast, Downs (1957) argued that voters responded more rationally to economic realities, and Key (1966), to evaluations of current political performance.

Extensive literatures on political socialization and racial prejudice developed on the premise that preadult attitude acquisition left highly stable, and powerful, residues well into adulthood (see Harding et al., 1969; Hyman, 1959; Renshon, 1977; Sears, 1975). These precipitated a backlash, arguing that preadult political attitudes were inconsequential and transitory "non-attitudes" (Vaillancourt, 1973; Searing, et al., 1976; see Sears, 1989, for a recent review).

Nevertheless, The American Voter's presumably early-socialized party identification remained the dominant "unmoved mover" in theories of voting behavior well into the 1980's. That was challenged by "revisionists," who contended that party identification was adjusted in some rational fashion to ongoing events, such as poor government performance (Fiorina, 1981), newly emerging issues (Franklin, 1984; Markus, 1979), candidates (Markus, 1982), or campaign events (Allsop & Weisberg, 1988), and that these changes had important effects on aggregate distributions of party identification (MacKuen et al., 1989). In return, counter-revisionists have argued that party identification is in fact almost perfectly stable over time, adjusting for measurement error (Green & Palmquist, 1990), and that it continues to dominate voting

behavior (Miller, 1991).[1]

These debates are of unquestioned importance for an understanding of presidential voting behavior in the United States. And they begin to help us develop a general theory about the human element in democratic governance, as well. But for that purpose they fail to address three important questions.

One concerns the role of exogenous events in influencing adult individuals' predispositions. The "revisionists'" empirical evidence is almost entirely anecdotal, rarely attempting general principles about which ones will have an impact and which ones will not. Some issues and campaign events seem to generate change in party identification and others do not, but there has to date been little effort to develop general principles from which such variations could be explained.

A second concerns the many other predispositions that are known to influence public opinion and voting behavior. Party identification is just one of a wide number of political predispositions that have important political impact. Many observers believe that racial attitudes represent the most difficult pivot point for American politics, that nationalism or ethnic rivalries dominate the politics of many other nations, that loyalty to highly personal leaders like Peron or Saddam Hussein or Mao or Castro dominate others, or that attitudes toward the symbols of the state are crucial bulwarks of a stable political system. The current debate ignores these other predispositions.

The third concerns the life course of major political predispositions. Their stability could be interrupted at any of three distinct points in the life cycle. Early acquisition may be weaker than the original political socialization enthusiasts believed; basic predispositions may not be as persistent across the life cycle as originally claimed; or, adult information-processing may weigh current information more heavily, and standing preferences less heavily, than originally thought.

The Socializing Role of Political Events

The persistence of political attitudes varies greatly across attitude objects. Party identification is highly stable across considerable lengths of time, while at the other extreme, most people seem to respond to some policy issues as if they were flipping coins (Converse, 1970; Converse & Markus, 1979; Sears,

---

[1] Even the "revisionists" concede that "rational" individual changes in party identification, in response to politically meaningful events, are not usually very dramatic (see Franklin, 1992; Weisberg & Allsop, 1988).

1983).[2] Such differences might be due to any of the three stage-linked processes cited above (acquisition, persistence, or incentives for rational choice). In this paper we will focus only on the first -- the original acquisition process.

Different attitudes are likely to have quite different growth curves, as Hyman (1959, p. 61) observed early on. As a result, attitudes toward different attitude objects are likely to reach adult-like intrinsic strength at different life stages. It might be, for example, that basic religious and racial attitudes are learned quite early, and esoteric political preferences much later.

To account for such differences across attitude objects, we have presented a model revolving around the external circumstances that generate differences in attitude stability (Sears, 1983). The key mediating variable is strength of affective learning, governing the resistance to change of any given attitude to either systematic influence attempts or random oscillation. Strong affective learning depends on (1) affective mass, in terms of the volume of affectively-toned information upon which the attitude is based (see Anderson's, 1971, integration theory, or Converse, 1962); especially when it is (2) one-sided communication, i.e., when the individual is primarily exposed to one point of view (as in "de facto selective exposure;" see Sears, 1968); and (3) overt practice, i.e., the more the person has practiced an overt response based on the attitude, the more stable it should be (see Campbell et al, 1960, on the strengthening of party identification through repeated voting).[3]

Political events enter the equation by influencing the affective mass, one-sidedness of communication, and overt practice associated with any given attitude object. For example, the greatest affective mass should be generated by the objects that evoke the most communication. That in turn depends partly on frequent recurrence of the object on the public agenda, and its high salience when on the agenda. For example, a regular electoral cycle places partisan divisions before the public, and would obviously contribute to the stability of party identification; interruptions, or changes in the party system, would lessen it (Converse, 1969). But an American election campaign will rarely

---

[2] Krosnick (1991) has suggested that such differences are mostly due to differential measurement unreliability across domains. Without going into detail here, this position seems to us exaggerated, attributing much genuine attitude instability to measurement unreliability.

[3]. This model bears some considerable resemblence to that developed and tested in more detail by Zaller (1992). In this paper we will not attempt to compare the two approaches.

focus on a distant country like Nigeria, or groups like Greek-Americans, or very specialized issues like appropriations for basic science. So it would be unlikely to stabilize attitudes toward such objects.

Similarly, the one-sidedness of communication varies across events. Election campaigns might stimulate one-sided interpersonal communication because family and peer groups tend to be homogeneous in partisanship. The Clarence Thomas confirmation hearings, on the other hand, might not, since mixed-sex work and family groups might be more heterogeneous with respect to gender issues.[4]

The theoretical analysis just presented suggests that the strongest attitudes will be socialized when communication on the issue is plentiful and affectively consistent. This implies that events in the political arena triggering massive and one-sided communication in the individual's microenvironment will be most helpful. Political socialization of strong attitudes should therefore proceed in fits and starts, since those events are likely to be episodic, and thus the opportunities for socialization will likely be periodic rather than continuous. To understand the socializing effects of events, then, we need to look at them as occasions for political communication, and at the specific attitude objects attracting that communication.

Presidential Campaigns as Socializing Events

In this study we have three broad concerns. First, we are focusing on the presidential campaign as an occasion for political socialization. Second, we focus on life-stage effects; we expect more evidence of socialization in early adolescence than in late adolescence or adulthood.[5] And third, we focus on differences across attitude objects.

Presidential campaigns are among the most evocative of political events. The mass media give them great publicity over a long period of time, in both the primary and general election seasons. The contests also provide the occasion for considerable

---

[4] Of these three factors, overt practice is probably the least relevant, in general, for object differences in the stability of political attitudes in children. But a regular electoral cycle does demand repeated voting acts, and extensive discussion of electoral choices, both of which should stabilize partisan preferences.

[5] An earlier report (Sears & Weber, 1988) presented preliminary analyses on this point.

interpersonal communication; people often talk to each other about their candidate preferences, their evaluations of the candidates, the events of the campaign, and its issues. For children, presidential campaigns provide both unusually frequent and rather one-sided political information flows. Parents typically share candidate and partisan preferences, and (less predictably but also usually) the child's peer environment is likely to be supportive as well. Children are less likely to be exposed to the more balanced treatement of the campaign in the mass media than are adults (see Comstock et al, 1978). And, given the four-year cycle of presidential campaigns, children in early adolescence are more likely to be experiencing their first campaign than are those in late adolescence. So a presidential campaign ought to be a prime occasion for the socialization of strong partisan attitudes.

We would expect these campaign-driven gains to be more marked for attitudes toward the candidates and parties than for attitudes about issues. The dominant content of campaign communication focuses on the candidates themselves, as indicated by the evidence on the "horserace" character of media coverage (e.g., Patterson & McClure, 1976; Orren & Polsby, 1987). There is inevitably some secondary communication about the parties, since the two major clusterings of pre-convention candidates are categorized into the two parties, and the parties ultimately select one each for the final contest. Issues usually play a secondary role to the candidate focus, even those most intensely debated by the candidates. And in every political campaign, some important issues simply do not surface at all.

How do we index gains in political socialization? There are usually two criteria for successful socialization (see Sears, 1975). One is the acceptance of desired norms, whether those of the family, the social group, or the broader society; e.g., a Republican family may wish to instill Republican loyalties in its children. Alternatively, successful socialization may be manifested by a strong and coherent set of political values and attitudes, whatever their particular content. This latter criterion forms the basis of our study.

Specifically, we focus on three indicators of attitude crystallization: the consistency of an attitude across related content areas (as in the consistency across alternative measures of the attitude, or related contents, as in Converse's, 1964, notion of issue constraint); stability over time; and power to influence other attitudes (as in the power of party identification to influence candidate evaluations). This notion has been developed elsewhere (see Sears, 1975).

Specific Predictions

Our study involves a three-wave panel, with interviews at the beginning of the 1980 presidential campaign, at its conclusion, and

then again a year later.[6] The interviews were conducted with children from age 10 to age 17, along with one parent for each child as an adult comparison point (we do not here exploit the parent-child pairing). The survey was a probability sample of Wisconsin families, interviewed by telephone. A total of 620 adults-child pairs were interviewed, of which 366 were interviewed in all three waves.

Our expectation would be that:

(1) Preadults should, on the average, have had relatively uncrystallized attitudes prior to the campaign. As a result, partisan attitudes would show sizable gains in the first time interval, which the post-election year would simply stabilize.

(2) These socialization gains would be most marked among the youngest children, since they would have had fewer prior experiences with presidential campaigns.

(3) They should be greatest in domains most directly the focus of campaign-linked communication; specifically, candidate evaluations and party identification.

(4) Typically, the issues of a campaign are less salient than candidate and party. But not all issues are equally obscure. The 1980 challenge by Ronald Reagan to the incumbent Carter administration revolved particularly around basic ideological differences and conventional partisan economic issues (Carter as a "tax-and-spend liberal"). Because of their lesser salience during the campaign, these domains should have yielded more modest socialization gains among preadult children.

(5) Some issues are likely to be hardly visible at all in any given campaign. In 1980, racial issues were not a visible part of the campaign dialogue, Reagan anxious not to get painted as a "racist," and Carter, to avoid being portrayed as too closely allied to blacks' interests. And civil liberties issues virtually did not appear at all. So we would expect no socialization gains on these issues.

Analytic Strategy

Our basic analytic strategy tests the effects of the campaign by comparing wave 1, conducted at the outset of the campaign, with wave 2, conducted at its conclusion. If the campaign were

---

[6] The research reported in this paper was supported by a National Science Foundation grant. We wish to express our deepest appreciation to Steven H. Chaffee and Jack Dennis, who shared responsibility for the data collection with the first author.

uccessful in socializing strong predispositions, our several indicators of attitude strength should increase between the two waves. If the campaign is the primary socializing influence, no comparable gains should be observable between wave 2 and wave 3, conducted a year later. On the other hand, if any gains result from the simple passage of time and maturation, comparable gains should be observed from wave 2 to wave 3.[7]

As statistical tests, we mainly present bivariate correlations. For attitude consistency, that typically represents alpha coefficients for the items within a domain; for stability, correlations of scale scores for a domain at one time point with those at the next; and for the power of one predisposition over another attitude, correlations of scale scores within one domain (e.g., party identification) with those in another (e.g., candidate evaluations). We have made the conventional assumptions about causal order; namely, that party identification is a more powerful causal force than either issue preferences or candidate evaluations.

To test the statistical significance of differences, we constructed scores for each individual for each dimension of attitude strength. For example, the stability of an individual's party identification from wave 1 to wave 2 would be indexed by the absolute difference between his/her party identification scale score in wave 1 and that score in wave 2. We then used analyses of variance to ascertain age and wave main effects, and their interaction. For testing the socialization effects of the campaign, the interaction is the critical term: the greatest gains should occur for the youngest preadults, and in the interval between waves 1 and 2 of the study.

Central Content of the Campaign

As indicated earlier, the most obvious and central content of any presidential campaign should concern the candidates and the parties. Therefore we expect the clearest socialization gains on those two dimensions.

Candidate evaluations

Our starting point is early in the 1980 presidential campaign, approximately at the time of the New Hampshire primary. At that point, preadult were deficient by all our indicators. They were less informed about the campaign, and had weaker and less stable partisan attitudes than were adults.

---

[7] It should be noted that this comparison is somewhat conservative in that it predicts larger changes in the first time period, which spans only nine months, than in the second, which spanned twelve.

The information scores are shown in Table 1. The candidate information scale consists of the mean percent identifying the party affiliations of the major candidates (Reagan, Bush, Carter, Kennedy, and Connolly). At the beginning of the campaign, the preadults could, on the average, identify the correct party of about half the candidates, whereas 82% of the parents did so.

[Insert Table 1 about here]

The preadults' ability to identify the candidates' parties was dramatically increased by the campaign, as shown in Table 1. The average child was able to match party and candidate for 67% of the candidates by the end of the campaign, up from 49%. In contrast, information for adults was quite stable. This pattern, then, is what we would expect if the campaign had a politically socializing effect for children but had relatively little effect on the parents.[8] This reflects a socializing impact of the campaign, and a major one. Their political socialization had proceeded a significant distance, by this criterion: they had about halved their informational shortfall. But their socialization was still substantially incomplete; a significant age difference remained.

The consistency coefficients for candidate evaluations are shown in Table 2. These index the extent to which respondents took consistently partisan views of Carter, Kennedy, Reagan, and Bush. The preadults' candidate evaluations had, on average, no partisan consistency whatever prior to the campaign (alpha=.00, -.17). But by the end of the campaign, consistency had improved markedly (to .33). Improvement continued in the year following, but not to the same extent. The adults' evaluations were considerably more consistent to begin with, and they too improved during the campaign, but rather little afterwards. So on this dimension, the preadults show considerable campaign-induced socialization, with continuing post-campaign effects, while the adults' gains are limited to the campaign period.[9]

[Insert Table 2 about here]

Similar evidence of a socializing effect of the campaign is shown by stability coefficients in Table 3. The candidate evaluation scale is based on evaluations of four candidates

---

[8] All the effects are statistically significant: parents had more information than children ($F=293.10$, 1/365 df, $p<.0001$), information increased over waves ($F=92.89$, 2/730 df, $p<.0001$), and age and wave significantly interacted, reflected in the diminished age gap over time ($F=41.21$, 2/730 df, $p<.0001$).

[9] Both age ($F=16.56$, 1/278 df, $p<.0001$) and wave ($F=35.17$, 2/556, $p<.0001$) effects were significant, although their interaction was not ($F=0.59$).

(Carter, Kennedy, Reagan, and Bush). The preadults show a dramatic increase in the stability of their evaluations across time; for the youngest group, stability increases from .32 over the first time period (the span of the campaign) to .65 over the second (the year following the campaign). The implication is that their initial candidate evaluations, prior to the campaign, were weak and unstable, whereas their evaluations at the end of the campaign were much stronger and more stable.[10]

[Insert Table 3 about here]

To summarize, at the beginning of the campaign, children were much less able than adults to match candidates with their parties, did not have consistently partisan attitudes toward the candidates, and had much less stable candidate evaluations than did adults. By the end of the campaign, their partisan attitudes had improved in all three respects, though still well short of adult levels. Only slight continued socialization effects were observable in the year following the campaign. The presidential campaign succeeded, then, in socializing reasonably strongly partisan candidate evaluations for preadults, though still not bringing them to adult levels.

Party identification

The basic information scale about the parties asked respondents to indicate whether Democrats, or Republicans, or neither was more closely associated with fourteen symbols traditionally associated with the two parties (such as elephant or donkey, liberal, poor people, Richard Nixon, business, etc.). As can be seen in Table 1, both children and adults showed more accuracy in interpreting these symbols over time, with preadults improving more than did adults.[11]

The basic party identification scale was based on four items: the standard Michigan party identification item (per Campbell et al., 1960), the Dennis revision that asks respondents separately for their preference between the two parties and for their self-identification as "Independents," and two items (combined into a composite) on trust of Democrats vs. trust of Republicans.

The stability of party identification shows the pattern of

---

[10] The age difference was statistically significant ($F=26.92$, 1/265 df, $p<.0001$) as was the wave difference ($F=34.90$, 1/265 df, $p<.0001$). In the analysis of variance, the interaction was not significant.

[11] The age ($F=382.52$, 1/364 df, $p<.0001$), wave ($F=63.53$, 2/728 df, $p<.0001$) and interaction ($F=11.77$, 2/728 df, $p<.0001$) effects were all significant.

campaign-induced socialization gains among the young, as indicated in Table 3. Stability is much lower for the preadults than for the adults over the course of the campaign (r=.49 and .58, as opposed to .86 and .90). But it increases substantially more for the preadults in the post-campaign period, as would be expected if the campaign strengthened the preadults' party identification (to .65 and .73, as opposed to .85 and .88).[12]

The one set of data that do not fit this portrait is the party consistency data, shown in Table 2. All age groups had rather high levels of partisan consistency, even at the start of the campaign. To be sure, the youngest age group is initially the least consistent, and shows the biggest gains. And its biggest gains do occur over the course of the campaign. But the differences are small (only the wave effect is significant: F=4.29, 2/726 df, p<.02).

In short, party identification, by and large, shows the same pattern as candidate evaluations. Relative to adults, the preadults are considerably less knowledgeable, and have less consistent and less stable partisan attitudes, at the outset of the campaign. The campaign provides more partisan information to them, and strengthens their party identification. The year following the campaign continues to strengthen attitudes, but not to the same degree. The one set of anomalous data concerns the consistency of party identification, which was relatively high in all groups even at the start of the campaign. But aside from that, the data are fairly clear in showing campaign-induced socialization gains in the preadults' partisan attitudes on both candidate evaluations and party identification.

Subtler Campaign Content

We anticipated that children would show some, but less impressive socialization gains on the two dimensions that reflected the manifest issue content of the campaign -- basic economic issues and general ideology. Plainly Reagan intended to introduce a "Reagan Revolution," and was clear about it from the outset. His conservative positions differed sharply from those of the liberal incumbent, Carter. And he was clear about being an ideological conservative.

But the campaign (perhaps like almost all campaigns) often focused on other matters, such as the criticism of Carter's handling of the Iranian hostage crisis, the characterological

---

[12] Again all three effects are significant (age: F=83.60, 1/362 df, p<.0001; wave: F=5.16, 1.362 df, p<.03; interaction: F=6.53, 1/362 df, p<.02).

critiques of Carter during the primary and general election seasons, the distractions of the Anderson candidacy, and the attacks on Reagan as trigger-happy or too old for the job. Because of this perhaps typical diffusion of focus, we would expect that the socializing effects of the campaign would not be as evident in general ideology and attitudes toward specific partisan issues as in the candidate and party domains just discussed.

Ideology

The general ideology scale was composed of three items: self-reported ideology, and trust of liberals and trust of conservatives. As with party identification, parents initially had much more crystallized general political ideology than did the children. As can be seen in Table 4, ideology was considerably more tightly associated with party identification among the adults than among the preadults. And Table 5 shows that prior to the campaign, adults' ideologies were considerably more internally consistent and tightly correlated with candidate evaluations than were preadults'.

[Insert Tables 4 and 5 about here]

There was little evidence of any special socialization occurring for preadults as a consequence of the campaign. Rather, the small changes over the course of the campaign were equivalent for all age groups. Table 5 shows that neither consistency nor the power of ideology over candidate evaluations increased much among the preadults over the course of the campaign. In all of the analyses of variance relevant to ideology for the dimensions shown in Tables 4 and 5 there is a significant age main effect, but in no case is there a significant age X wave interaction.[13]

There are two exceptions. One is that the youngest group showed a marked increase in stability, reducing dramatically the gap between themselves and the somewhat older adolescents. The stability of their ideologies was only .15 through the campaign, but .47 through the year after it, almost up to the level achieved by the older adolescents (.53). And, in terms of attitude consistency, there is evidence of continued ideological crystallization in that group following the campaign: the alpha coefficient rises from .19 to .49 (see Table 5 for both findings). But these stand out as exceptions.

Instead, there is some evidence of a modest general increase in the crystallization of ideology across the entire period

---

[13] The F's for the age effects were 14.09, $p<.0001$, for party power over ideology; 10.61, $p<.001$, for ideological consistency; $F=21.14$, $p<.0001$, for ideological power over candidate evaluations; and $F=9.57$, $p<.002$ for stability.

(including the first year of the Reagan Administration), for all age groups. The wave main effect attains statistical significance only in the cases of ideological consistency ($F=2.89$, 2/340 df, $p<.06$) and ideological power over candidate evaluations ($F=4.48$, 2/544 df, $p<.02$), but the trend is visible in the linkage between party and ideology (Table 4) as well, and in stability of ideological preference, though this limited to the youngest preadults (Table 5).

As a result, the levels of ideological crystallization by the end of 1981 tended to be considerably higher than they were at the outset of the campaign, in all age groups. And among the youngest preadults, in particular, there is a major jump in the consistency and stability of ideology (see Table 5). But such increases cannot be attributed very directly to the campaign itself, since they tend to occur more generally across the entire period of the study.

Economic issue partisanship

On the basis of factor analyses of a variety of issue positions, carried out on the adults only, we created a scale for economic issue partisanship. It included items on the respondent's positions toward defense spending, health and education spending, environmental protection, nuclear power, and preferential access of women to jobs. The scale thus arrayed respondents in terms of the overall liberalism or conservatism of their issue positions.

As with partisan attitudes and ideology, large age differences existed on all dimensions of the strength of issue partisanship prior to the campaign. Table 6 shows that the consistency of issue attitudes across issues was quite low among the preadults relative to the adults (alphas of about .10 and .45, respectively), and the correlations of the issue partisanship scale with candidate evaluations were similarly considerably lower (.12 for the older adolescents compared to .35, or so, the adults). As a result, issue partisanship attitudes were less stable across the course of the campaign for preadults than for their parents (about .38 vs. about .68).[14]

[Insert Table 6 about here]

Age differences in the linkage of these partisan issues to partisan politics were somewhat less marked, initially, interestingly enough. Many children proved to be reasonably knowledgeable about party differences in these issue positions, as shown in Table 1 (although the age difference was also

---

[14] These age differences were all statistically significant in the analyses of variance. For consistency, $F=71.51$, $p<.0001$; for power over candidate evaluations, $F=20.76$, $p<.0001$; and for stability, $F=54.63$, $p<.0001$).

statistically significant; F=22.92, 1/364 df, p<.0001). And the linkage between party and issue partisanship was significant, though not large, as shown in Table 4 (F=5.92, p<.02).

The dominant finding is that all age groups, parents and children alike, developed stronger issue partisanship over the course of the study. That is, the effects of this era on issue partisanship were not specific to the campaign or to young preadults. As can be seen in Table 1, knowledge of party differences on issues continued to develop throughout, for both children and parents (F=63.53, 2/728 df, p<.0001). The linkage of issue partisanship to both party identification (shown in Table 4) and candidate evaluations (shown in Table 5) both increased somewhat with time (yielding significant, though quite modest, wave main effects: F=6.97, p<.001; F=4.48, p<.02).

As might be expected, these general increases in the crystallization of issue partisanship were less marked on the two indicators of intrinsic attitude strength than on linkages to campaign partisanship. Table 6 shows that both consistency and stability increased hardly at all, either during or after the campaign (though the wave effect is in fact significant for consistency; F=858, p<.0001).

But was there any evidence, more specifically, of socialization gains for the preadults during the campaign? They participated in the general gains with respect to the linkage of issues to partisanship, but neither uniquely (relative to adults) nor specifically during the campaign. Table 1 shows that they gained in familiarity with party issue positions equally both before and after the election, and about in equal measure as did the adults. Table 4 shows that the very modest gains in linkage between party and issue preferences occurred again in similar fashion across ages and waves. And the same is apparent for issue consistency, power over candidate evaluations, and stability, as shown in Table 6. The only significant age X wave interactions seem to be due to actual, if very small, losses by preadults during the campaign (regarding the linkage of party and issues, shown in Table 4, F= 7.72, 2/698 df, p<.0001; and consistency, shown in Table 6; F=4.43, 2/698 df, p<.02).

And there is clear evidence that the campaign did not help the preadults' issue positions themselves to become more crystallized. Table 6 shows that both consistency and stability changed hardly at all for either the younger or older preadults.

To sum up, the data on issue partisanship, like that on ideology, indicates modest gains among both preadults and adults, but primarily in the linkages of issue partisanship to candidate evaluations and party identification, and not specific to the campaign itself. There is no evidence that ideology or issue positions themselves became more crystallized during the campaign.

Issues Peripheral to the Campaign

We expected no socialization gains on issues that were quite peripheral to the campaign. As indicated earlier, two domains measured in this study fit this category: racial attitudes, on which Reagan attempted to avoid far-right positions that would allow him to be denounced as a racist, and civil liberties issues, in this case, freedom of speech for racists and Communists.

The racial tolerance scale contained six items, on giving black people special treatment for jobs; perceiving blacks as having gotten more than they deserve; affect toward racists; and support for allowing a racist to run for president, make a speech, or teach in high school. The civil liberties tolerance scale contained these last three items, and three others paralleling them on civil liberties for Communists.[15]

To make a long story short, there was very little evidence of socialization gains resulting from the campaign on these two dimensions. Table 7 shows that children's racial tolerance attitudes did become more consistent during the campaign, but not thereafter, and adults' did not. But the effects are modest in size. The consistency of children's civil liberties' tolerance was significantly lower ($F=6.64$, 1/302 df, $p<.01$) than were their parents', as also shown in Table 7, but neither of the other effects was significant.

[Insert Table 7 about here]

The data for stability are shown in Table 8. They show remarkably little change either during or after the campaign. Both sets of attitudes, by this criterion, seem to have been rather crystallized among both children and adults, and the campaign did little to alter this situation.

[Insert Table 8 about here]

The final criterion for attitude strength is power, in this case over candidate evaluations. In fact the correlations between both scales and our candidate evaluation scale were uniformly quite

---

[15] As can be seen in Table 7, these scales had reasonable, though not overwhelming, reliabilities. The racial tolerance scale yielded an alpha prior to the campaign, among the older adults, of .59; the civil liberties scale, .83 (larger in part, no doubt, because the items and response alternatives were very similar, and placed contiguously in the interview).

low, so we do not bother to present them. For racial tolerance, only three of the twelve correlations exceeded .09, and the median was .06. None of the effects in the analysis of variance was significant. For civil liberties tolerance, only two exceeded .05, and the median was .01.

To summarize, we have investigated the two domains that we regard as having been peripheral to the 1980 presidential campaign, racial and civil liberties tolerance. In neither case do we find any evidence of socialization gains on any of our three indicators of attitude strength.

Discussion

The phenomenon we address is the acquisition of stable political predispositions during preadult political socialization. Our hypothesis is that they often are acquired and strengthened through intensive exposure to political events. Such socializing events tend to be periodic rather than continuous. As a result, political socialization may not occur incrementally from the steady, gradual accretion of experience, but proceed in bursts, in fits and starts, as political events make particular attitude objects salient.

We have taken American presidential campaigns as prototypical cases of such socializing political events. While initiated by political elites, such events provide an occasion for mass political socialization. They stimulate intensive communication in the individual's microenvironment, which in turn provides many opportunities for influence, and the acquisition of longstanding predispositions.

We have earlier examined a presidential campaign as a politically socializing event, suggesting that it significantly strengthened, on a lasting basis, preadults' partisan predispositions (Sears & Weber, 1988). This paper extends that analysis, testing a domain-specificity hypothesis about precisely which predispositions will be strengthened by such an event. The key notion is that socializing events selectively make certain attitude objects more salient, while others lie dormant. The resulting communication then strengthen predispositions toward attitude objects in the domains directly addressed, but has only negligible effects in other domains.

The present study assessed the effects of an American presidential campaign upon the crystallization of preadults' political predispositions, in terms of their affective consistency, stability, and power over other attitudes. The hypothesis was that preadults would show significant socialization gains regarding attitude objects bearing most of the campaign communication -- the candidates and political parties -- and relatively little

concerning the less publicized aspects of the campaign, such as campaign issues, ideology, or issues not given much attention in the campaign.

There were four main findings:

(1) As might be expected, preadults' attitudes were significantly less crystallized than adults' prior to the campaign, in all domains tested.

(2) The strongest socialization impact of the campaign, in terms of preadults' attitude crystallization, occurred in the domains most centrally relevant to the campaign: candidate evaluations and party identification. In both domains, preadults showed greater information gains and stability of partisan attitudes as a result of the campaign, and in the former, more consistent attitudes as well.

(3) Political ideology and central campaign issues have been shown in prior studies to receive considerably less media attention than the candidates and parties. Accordingly, the campaign had little socializing impact in these domains. There was less change, usually adults gained as much as did the preadults, and changes as often occurred after as during the campaign. In these domains, the campaign did not play a distinctive socializing role, and did not narrow the gap between themselves and adults.

(4) There was no evidence of any socialization in domains essentially bypassed by the campaign: namely, racial and civil liberties tolerance.

Implications

The general implication is that such political events stimulate a wide variety of commmunications throughout the body politic, and thus provide an occasion for preadult socialization. in the domains bearing most communication about the event. The specific content of the event constrains the communication, however; some attitude objects receive a great deal of communication, and others do not. As a result, the socializing effects of the event are quite uneven (though still predictable) across domains.

We have used the presidential campaign as a prototypical case of a major political event, rather than with any particular goal of understanding presidential elections per se. But the findings of the study do help to understand long-established observations about adults' electoral behavior. Among adults, party identification and candidate evaluations are generally more stable, consistent, and powerful than are ideological or issue positions (Campbell et al., 1960; Converse, 1964; Converse & Markus, 1979; Sears, 1983). And our findings certainly support such generalizations. Among the

older adults, party identification was more consistent (.87) prior to the campaign than either ideology (.57) or issue partisanship (.46). It was also more stable over time (.90 vs. .78 or .70). And it was more closely correlated with candidate evaluations at the conclusion of the campaign (.72 vs. .53 or .39). Such differences also held before the campaign among the younger children: party identification was more consistent (.77) than ideology (.31) or issues (.11). And it was more stable (.49, compared to .15 and .29).

But the campaign enlarged such differences between domains among the youngest preadults; during that period, their party identification crystallized still further (Tables 2 and 3), while, if anything, their ideology and issue partisanship weakened (Tables 5 and 6). The oldest adults showed no systematic change on the three indicators of attitude crystallization in any of these three domains. This finding suggests that the well-known advantage to party identification (and to candidate evaluations, though that has been investigated less) is in part of the lasting socializing impact of a regular partisan electoral cycle.

In some ways the domain-specific socializing process we have described for political events is analogous to the "agenda-setting" described for mass communication impact among adults. For example, Iyengar and Kinder (1987) have shown that communicating heavily about one particular issue area leads viewers to center their judgments of the president's performance on that area. Similarly, Krosnick and Kinder (1990) showed that the eruption of the Iran-Contra scandal in 1986 led voters to base their evaluations of President Reagan increasingly on their attitudes toward American intervention in Nicaragua. Sears and Huddy (1993) showed that defining bilingual education as a vehicle for the maintenance of foreign cultures led non-Hispanic Americans to evaluate it more in terms of nationalistic attitudes.

The present approach makes an analogous argument: elites can focus the public's attention on certain attitude objects, which triggers a broader process of communication and socialization. This not only elicits certain attitudes and not others (as in the other studies just cited), but can produce longer-lasting strengthening of basic predispositions.

These effects of political events can also help us to understand the development of "generational units," as elaborated by Mannheim (1952). Major events, like presidential campaigns, can greatly strengthen preadults' attitudes toward the objects they make salient. A prime example is the postwar history of racial conflict in the United States. From the mid-1950's to the mid-1960's this focused on the struggle against the remnants of Jim Crow segregationism in the South, a highly publicized effort whose egalitarian basis attracted great support among Northern white Americans. As a result, the socialization of young adults in that

domain and in that era was highly favorable to racial egalitarianism, and each new cohort of white Americans was more racially liberal than the last (Schuman, Steeh, and Bobo, 1985).

The same racial domain continued to receive much publicity during the 1970's, but focused on bitter court battles over "forced busing" and affirmative action, much of which drew strong opposition from white Americans. There is evidence that young white Americans have not been socialized to more liberal positions in the racial domain in the more recent era (Davis, 1991). That is, if events focus heavily on attitude objects on which the dominant norms are liberal, such as equal access to public accommodations, then they will tend to socialize youthful cohorts to more liberal views. But if the events focus attention on attitude objects toward which the dominant norms are more conservative, such as busing or affirmative action, youthful cohorts may grow up more conservative.

Analogously, it appears that the searing experiences of young Croats and Serbs during World War II left them with longstanding enmities that are getting played out today; one can only spculate on the long-term consequences of the current hostilities on now-youthful cohorts in the former Yugoslavia. Any longstanding religious, national, or tribal enmities should contribute to stable preferences, whether those in Northern Ireland, Yugoslavia, or the Caucasus.

Finally, what if major events do leave strongly crystallized attitudinal residues in young adults? What are the implications for the debate between political psychological and rational choice theories alluded to at the outset? It would enhance the weight that such longstanding predispositions are given in adult decision-making. If these predispositions originate in socialization events that are long past, such as those these preadults experienced in the 1980 presidential campaign, they may not fully reflect the realities of the choice alternatives with which they are confronted in later adulthood. However, the existence of such longstanding affectively-driven biases represents just one of the challenges the more comprehensive view of human nature presented by political psychology offers to the relatively narrowly focused view presented by rational choice theories.

TABLE 1

Partisan Information
(by Age and Wage)

A) Identification of candidate's parties (five items)

	Wave			Interval	
	1	2	3	1 to 2	2 to 3
Age 10-17	49	67	66	+18	-1
Age 28 +	82	87	85	+5	-2

B) Knowledge of party symbols (fourteen items)

	Wave			Interval	
	1	2	3	1 to 2	2 to 3
Age 10-17	39	44	50	+5	+6
Age 28 +	69	72	73	+3	+1

C) Knowledge of parties' issue positions

	Wave			Interval	
	1	2	3	1 to 2	2 to 3
Age 10-17	41	52	64	+11	+12
Age 28 +	48	61	71	+13	+10

Note: Entries are, respectively, the mean percent of the five candidates correctly matched with party, of fourteen party symbols correctly assigned to party, and of correctly defined party differences on four issues.

TABLE 2

Consistency of Partisan Attitudes
(by Age and Wave)

A) Candidate evaluations (four items)

	Wave			Interval	
	1	2	3	1 to 2	2 to 3
Age 10-13	.00	.33	.53	+.33	+.20
Age 14-17	-.17	.33	.42	+.50	+.09
Age 28-40	.30	.61	.64	+.31	+.03
Age 41+	.33	.50	.58	+.17	+.08

B) Party identification

	Wave			Interval	
	1	2	3	1 to 2	2 to 3
Age 10-13	.77	.84	.86	+.07	+.02
Age 14-17	.81	.85	.87	+.04	+.02
Age 28-40	.85	.86	.87	+.01	+.01
Age 41+	.87	.87	.88	.00	+.01

C) Candidate evaluations X Party identification (correlation between scales)

	Wave			Interval	
	1	2	3	1 to 2	2 to 3
Age 10-13	.12	.48	.56	+.36	+.08
Age 14-17	.28	.56	.59	+.28	+.03
Age 28-40	.62	.64	.69	+.02	+.05
Age 41+	.64	.72	.69	+.08	-.03

Note: The entries are the alpha coefficients for part A and part B, based on four candidate evaluations and four party identification items. The entries in part C are the pearson correlations between the two scales for each wave. The number of cases ranges from 146 to 165, 181 to 189, 148 to 155, and 197 to 205, for the four age groups, respectively.

TABLE 3

Stability of Partisan Attitudes Over Time
(by Age)

A) Candidate evaluations

	Wave 1 X Wave 2	Wave 2 X Wave 3	Increase
Age 10-13	.32	.65	+.33
Age 14-17	.47	.60	+.13
Age 28-40	.64	.80	+.16
Age 41+	.70	.78	+.08

B) Party identification

	Wave 1 X Wave 2	Wave 2 X Wave 3	Increase
Age 10-13	.49	.65	+.16
Age 14-17	.58	.73	+.15
Age 28-40	.86	.85	-.01
Age 41+	.90	.88	-.02

Note: Entries are pearson r's for the candidate evaluation scale (based on four candidates) across waves, and the party identification scale (based on four items) across waves.

TABLE 4

Ideology and Issue Positions
(by Age and Wave)

A) Ideology

	Wave			Interval	
	1	2	3	1 to 2	2 to 3
Age 10-13	-.12	.14	.18	+.26	+.04
Age 14-17	.19	.28	.31	+.09	+.03
Age 28-40	.44	.29	.56	-.15	+.27
Age 41+	.47	.59	.75	+.12	+.16

B) Economic issue partisanship

	Wave			Interval	
	1	2	3	1 to 2	2 to 3
Age 10-13	..07	.14	.18	+.07	+.04
Age 14-17	.19	.12	.21	-.07	+.09
Age 28-40	.22	.29	.35	+.07	+.06
Age 41+	.29	.35	.45	+.06	+.10

Note: Entries are alpha coefficients. Economic issue partisanship consistis is a scale consisting of agree disagree items involving statements about government spending on health care, defense, equal rights, nuclear power, and the environment.

A RATIONAL ACTOR MODEL OF SUPREME COURT DECISIONS TO ACCEPT CASES FOR REVIEW

Jeffrey A. Segal
SUNY Stony Brook

Donald R. Songer
University of South Carolina

Charles M. Cameron
Columbia University

Paper prepared for delivery at the 1993 annual meeting of the American Political Science Association, Wahsington, D.C. We gratefully acknowledge the support of National Science Foundation grant SES-9112755.

A Rational Actor Model of Supreme Court Decisions to Accept Cases for Review

The decision to grant certiorari[1] is perhaps the best studied area of Supreme Court behavior. Scholars have no doubt been attracted by the substantive importance of agenda setting, the game-theoretic context in which cert voting takes place, and the unusual richness (for Supreme Court scholars, at least) of available data.

The major premise (though not the only one) behind much of the early work on certiorari and some of the more recent work is the assumption that the Supreme Court, as an explicitly political institution, tends to hear cases it wishes to reverse (Brenner, 1979; Caldeira and Wright, 1988; Palmer, 1982; Schubert, 1959; Songer, 1979; Ulmer, 1972, 1984). More recently, though, scholars have argued that error correction is a minor part of the cert process. Rather,the decision over which cases to hear is substantially or largely legalistic in nature (Perry 1991a, 1991b; Provine 1980). The most compelling explanations of the Court's behavior in decisions on the merits, opinion assignments, and opinion coalitions center around political and/or attitudinal factors. It is only at the agenda-setting stage that legal realism remains in dispute.

While the attitudinal model has provided considerable insight into the decisions of the Supreme Court, it is only the starting point for the explanation of the dynamics of the interactions among the Supreme Court and other courts in the federal system. We have argued elsewhere (Songer, Segal & Cameron, 1992; Cameron, Segal & Songer, 1993) that these interactions are best understood from the perspective of a principal-agent model which assumes that the litigants engage in rational calculations when deciding whether or not to appeal an adverse decision. In the present paper we test some of the implications of these models for the decision of the Supreme Court to review the decisions of the United States Courts of Appeals.

The finding that the Supreme Court reverses the majority of the cases it accepts for review is well established (e.g., Segal and Spaeth, 1993, p. 195). Nevertheless, we cannot determine whether the Supreme Court follows a reversal strategy simply by

---

[1] Much of the literature is not clear about whether what is being studied are cert petitions per se or the larger category of attempts to secure Supreme Court review through either certiorari or appeal. For convenience, we refer to the subject of all such studies as "certiorari" unless the study explicitly states that it also includes appeals. Our own analysis is based on all attempts to secure review. We do not separately analyze only certiorari petitions.

examining cases the Court chooses to hear. If litigants are rational a substantial percentage of cases appealed to the Court will conflict with contemporary Court preferences (Cameron, Segal, and Songer, 1993). Thus even if the Court were indifferent to error correction strategies we might find the Court reversing a majority of the cases it decided. The only way to answer whether the Court follows an error correction strategy is to compare the Court's preferences on cases it chooses to hear to its preferences on cases it chooses not to hear.

The principal-agent perspective reminds us that subordinates (lower court judges) will take actions that their principal cannot fully see; that is, lower court judges will always have some information that the Supreme Court does not. The Supreme Court may suspect, on the basis of cert petitions, etc., that it doesn't like what a lower court did, but it can't be sure unless it actually hears the case. Given this problem of incomplete information, what reviewing strategy should the principal pursue ? If the Supreme Court is rational, it will adopt a probabilistic strategy which utilizes every signal and cue that is readily available from the necessarily less than complete information it possesses.

In deciding whether to review a case, we hypothesize that the Court will base its decision on two types of information: the probability that the policy implications of the lower court decision are inconsistent with Supreme Court preferences and the ideological composition of the lower court. That is, although a rational policy oriented Supreme Court will want to reverse attempts by the lower court to change policy to better fit lower court policy preferences (i.e., to shirk), this objective will not be best achieved by a simple error correcting strategy. Given its limited resources, the Court cannot reverse every decision which is not perfectly congruent with its policy preferences. Instead, it will want to "correct" (reverse) those decisions that imply significant attempts to change the basic policy rather than those that merely apply existing policy incorrectly. The further the decision appears to be from the Court's policy, the more likely it represents an actual change in policy rather than a mistaken application. Thus, in choosing for review cases based on the magnitude of the perceived departure from current policy, the pattern of review decisions will resemble an error correction policy. But rational justices will be more suspicious of lower court judges who they perceive to be ideologically distant. Therefore, they will be more likely to review decisions with a given probability of "error" if the decision came from a lower court whose judges were ideologically distant from the preferences of the Supreme Court.

Error Correction and the Decision to Review

No previous studies have attempted to apply the perspectives of principal-agent theory to the Supreme Court's review decisions. However, one of the key components of that perspective, the extent to which the Court follows an error correcting strategy has been

the subject of some study. The literature on the relevance of error correcting strategies for certiorari decisions may roughly be divided into two types of analysis: individual-level studies examining the votes of justices for and against cert and aggregate--level studies examining the vote of the Court for and against cert. The first person to actually examine the votes of the justices on cert was S. Sidney Ulmer (1972). Ulmer proposed a simple reversal strategy for the justices: justices who voted for cert will support the applicant on the merits; justices who voted against cert will not support the applicant on the merits. Ulmer found a significant relationship between cert vote and merits vote for 8 of 11 justices, but the correlations were quite low, ranging from .00 to .157. We believe this is largely because simply voting to grant based on one's position on the merits is too ineffective a strategy for strategic politicians to follow.

More sophisticated analyses by Brenner (1979) and Brenner and Krol (1989) examine subtler reversal strategies. Brenner finds, for instance, that when there are only four votes for cert, i.e., when each justice's vote for cert matters, justices who vote for cert and want the Court to affirm will have a higher success rate than those who vote for cert and want the Court to reverse. In other words, justices who want to affirm don't provide the fourth vote for cert unless they are virtually certain that they will prevail on the merits (but see Provine, 1980; and Krol and Brenner, 1990).

The second strand in the literature concerns itself with the Court's aggregate decision whether or not to accept cases for review. The number of studies that examine the Court's (putative) preferences on cases that are appealed to it are few in number and inconclusive in results. The first study along these lines found that in periods of rapid change in the ideological center of the Court, the proportion of liberal versus conservative decisions below accepted changed decisively (Songer 1979). For example, following the "switch in time" the Supreme Court was more likely to hear conservative lower court economic decisions than liberal ones. Similarly, Armstrong and Johnson (1982) found that the Burger Court was more likely to grant cert in civil liberties cases when the decision below was liberal than when it opposed individual rights. These studies, though suggestive of what we hope to demonstrate, treat all economics and all civil liberties decisions as an undifferentiated mass. Whether disagreement with particular decisions leads to cert cannot be determined from these studies.

The case-by-case approach taken by Caldeira and Wright does have the potential to answer our question. Using judgments made by the staff of the New York University Law Review, they categorized cases as to whether they contained conflict or not. Unfortunately, their "Conflict" variable combines cases where the conflict was between circuits (and thus a legalistic concern) and cases where the conflict was between the lower court and the Supreme Court (and thus, presumably, a political concern). A second conflict variable, based on claims made by petitioners, also

fails to distinguish what for our purposes are two distinct types of cases.

The only works that focus specifically on conflict with Supreme Court precedent as a reason for granting certiorari are 1983 and 1984 articles by Ulmer. Initially, he notes that counsel for appellants apparently believe that conflict with Supreme Court precedents will encourage the Court to grant cert because such conflict is claimed in more than half of all petitions (and six or more conflicts were claimed in over 10% of the petitions). But since he notes that attorneys may "pad" their claims that the decision below conflicts with precedent, Ulmer proceeds to classify his sample of cases into those that contain real conflict with Supreme Court precedents and those that do not. Using this distinction between actual and alleged conflict with precedent, he finds that actual conflict is the most important variable for understanding grants of certiorari, explaining a higher proportion of the variance than the economic case or civil liberties case cues identified by Tanenhaus, et.al.,(1963) or the presence of the federal government as the petitioning party. While Ulmer's findings are impressive on their face, we believe the question of conflict has not been closed by his work.

In stark contrast to the findings of Ulmer, Perry's interviews with five of the justices on the Supreme Court and a large number of Court clerks leads him to declare flatly that the justices do not use an error correction strategy in cert decisions. He quotes Chief Justice Vinson as saying that the Supreme Court "is not, and never has been, primarily concerned with the correction of errors in lower court decisions" (1991b:36). Perry is emphatic on this point, which he apparently believes will come as a surprise to many of his readers. In commenting on the Vinson statement quoted above, Perry says, "Note the statement that the purpose of cert. is not error correction. Time and again my informants - justices and clerks - stated that the Supreme Court was not there to insure justice. Even for the most sophisticated Court observers, hearing this stated so bluntly is disconcerting..." (1991b:36).

Though Ulmer's work flies in the face of the nearly unanimous position of the justices and clerks interviewed by Perry, we are typically more likely to believe revealed preferences (i.e., information on how they actually vote) to stated preferences (e.g., potentially self-serving answers to interview questions). Unfortunately, there are enough flaws in Ulmer's methodology to prevent closure of the question. His operational definition of conflict is whether he believed the case conflicted with Supreme Court precedent. He provides no guidelines for how he determined that an actual conflict existed. His judgments appear to be highly subjective and not amenable to replication. Moreover, despite the innumerable problems making such inferences (Feeney, 1975), there are no reliability checks. Certainly, there is room for a more objective and replicable test of the proposition.

Further, although Ulmer is not explicit on this point, it appears that his measure of actual conflict is static. That is, he

apparently conceives of a given ruling as being inherently in conflict or not in conflict with precedent without taking into account either the changing nature of precedent over time or the changing preferences of the Supreme Court. For example, a decision announced by an appeals court at a given time (t) might be in conflict with both the existing precedent and real preferences of the Supreme Court. Two years later (t + 2), after personnel change on the Court the same decision might be consistent with the preferences of the current majority even if there had been no formal alteration of precedent. Still later (e.g., t + 5) that same decision might be consistent with a new precedent which reflected the preferences of the new majority. A measure of conflict is needed which is more sensitive to the inherently changing nature of "conflict."

Finally, there is no consideration of nuance. While Feeney classified cases along a four-point continuum ranging from most to least conflict, Ulmer dichotomizes. In spite of the inevitable uncertainty of the measure, Ulmer reduces his measure of conflict to two categories: genuine conflict and no genuine conflict. But a substantial body of literature on the impact of Supreme Court decisions suggests that such a dichotomy misses much of the dynamic of the response of lower courts to Supreme Court precedent. Lower courts may fail to support the basic policy of the Supreme Court to varying degrees without being overtly noncompliant (Wasby, 1970; Songer, 1987; Beatty, 1972). Therefore, it is more appropriate to conceptualize conflict between appeals court decisions and Supreme Court precedent as a continuous function.

In summary, there are two strands to the literature on the use by the Supreme Court of an error correction strategy in its decisions on which cases to accept for review. On the one hand, several studies suggest that the Court accepts for review those cases that were decided "incorrectly" from an ideological perpspective. Other studies suggest that the Court is inclined to accept those cases whose decisions conflict with legal precedent. Both of these propositions concerning error correction are firmly disputed by the justices and their clerks. In order to assess the utility of a principal-agent perspective, we first develop a measure of the extent to which the Court pursues an error correction strategy. We do not investigate the effect of conflicts which can be defined narrowly as being either purely legalistic or solely ideological. Instead, we categorize the decisions below according to the <u>degree</u> to which they are consistent with current Supreme Court <u>policy</u>, which we understand as the summation of the preferences of the justices. Recent work (e.g., George and Epstein, 1992; Songer and Haire, 1992; Richardson and Vines, 1970) suggests that those policy preferences reflect the justices' views about precedent as those views are filtered through their ideological values.

Determining whether the Supreme Court is more likely to vote to review cases in conflict with its policy requires a well--specified model of judicial decision making. We cannot know if

the Supreme Court prefers to review (and ultimately reverse) cases opposed to its current doctrine unless we can assess how the Court would vote on the cases the Court does and does not hear. Answering this question requires that we control for the facts of the case. We will do so by collecting data on a sample of the search and seizure decisions of the courts of appeals from 1962 through 1990.

With the data we have collected, we can objectively test the role that conflict with current Supreme Court doctrine plays in the granting of certiorari. For each search and seizure case that is appealed to the Supreme Court, we can use the logit equation for the Supreme Court's search and seizure cases and the logistic probability function to determine the probability that the contemporary Supreme Court would uphold the decision at hand. That probability becomes one of the independent variables of interest in our prediction equation for the granting of certiorari. We will add to that equation variables representing the ideological distance between the courts, dissent on the appeals court, appeals court reversal of a lower court, and whether the United States petitions for review.

Data and Methods

To evaluate whether a principal-agent perspective provides a satisfactory model of the Court's review decisions, we need to be able to asses two critical factors: 1) the degree of distance between the ideological preferences of the Supreme Court and each appeals court panel whose decision has been appealed and 2) the probability that a given decision of the courts of appeals was decided "incorrectly;" that is, if the Supreme Court reviewed the decision, what is the probability that the appeals court decision will be reversed ? We know of no satisfactory prior attempts to operationalize the concept of the ideological distance between the Supreme Court and a lower court. The most obvious measure, the percentage of liberal decisions by each court, is not satisfactory because it is unreasonable to assume that the nature of the cases heard by the different courts is similar. We started from the assumption that judges on the two courts are selected from roughly the same pool of political elites in the country. In addition, we note that essentially the same set of actors is involved in selecting judges for both levels and that in making selections for each court evaluations of the policy views of the potential nominees are considered. Therefore, we conclude that the range of policy positions on the two courts over time will be roughly the same. Therefore, we construct an index of the liberalism of each court (separately) which ranges from zero (most liberal) to one (most conservative). The appeals court index score represents the relative liberalism of each panel compared to all other appeals court panels in the thirty year period studied. Similarly, the score for each Supreme Court represents its liberalism relative to other Supreme Courts over the same thirty year period. The absolute value of the difference between these two scores is used

as the operational definition of ideological distance between the two courts.

The second element of our principal-agent model, a measure of error correction, requires that we be able to assess the strength of the legal arguments in the appeals court opinion as those arguments are likely to be evaluated through the filter of the attitudinal predispositions of the current Supreme Court majority. Such an assessment requires careful attention to the facts of their particular case, an understanding of the importance attached to each of those facts by the Supreme Court, and knowledge of the attitudinal perspectives of members of the Court. Therefore, we need a model of Supreme Court decision making that takes into account both the most important case facts and the changing attitudes on the Court.

To satisfy that requirement, we choose the search and seizure cases and the fact-pattern models developed therefrom by Segal (1984, 1985). We choose the search and seizure cases for our analysis for two reasons. First, our work requires a well-specified model of Supreme Court decision making. A number of recent studies suggest that such specification requires a model which includes both case fact patterns derived from Court doctrine as well as indicators of judicial values (Segal and Spaeth, 1993; Segal, 1984; George and Epstein, 1992; Songer and Haire, 1992; Hagle, 1991; Wolpert, 1991). To our knowledge, no fact-pattern analyses have performed as well as the search and seizure models. Second, to determine whether cert decisions reflect changing Supreme Court doctrine and preferences , we need a substantive area that has seen a fair amount of change in the Supreme Court's doctrine. In few areas have there been as much change as in the Supreme Court's Fourth Amendment adjudication (Blasi, 1983; Funston, 1977; Kamisar, 1984)

Segal's model combines an examination of the place of the intrusion (e.g., home, business, car), the extent of the intrusion (full search vs. lesser intrusion), the prior justification (warrant and probable cause), and various exceptions to the warrant requirement (e.g., searches incident to arrest) with a measure of the attitudinal preferences of the Court majority. Using data that add all search and seizure cases decided by the Supreme Court through the end of its 1990 term) to the data analyzed in Segal's earlier (1984) work, a logit model of the Court's decision making categorized 78% of the cases correctly with a reduction in error of 41%.

Any assessment of Supreme Court preferences over time must consider whether those preferences have changed and how they have done so. Most systematic attempts to measure change on the Supreme Court or among individual justices have measured the percent of cases decided in a liberal or conservative direction over time (e.g., Brenner and Arrington, 1983; Ulmer, 1973, 1979). Such designs have much to tell scholars, but they attribute all change to the justices and none to the changing nature of the cases (see Baum, 1988 for a notable exception). Fortunately, we already can

control for case characteristics (see above). To measure change explicitly we tested a variety of models of how the Court's decisions have changed in search and seizure after controlling for the facts of the case. We concluded that the model suggesting that the Court has become increasingly conservative with each passing term since the advent of the Burger Court is superior to plausible alternatives.[2] The parameter estimate for the term variable, .0919, suggests that a search that had a 50% chance of being upheld in the 1968 term would have an 89% chance of being upheld in the 1990 term. Our model therefore includes a measure of changing Supreme Court policy orientation which takes the value of 68 during the Warren Court years and increases by one for each successive year beginning with the advent of the Burger Court.

Our data for this analysis consist of a stratified random sample of the decisions of the United States Courts of Appeals in search and seizure cases decided with opinions (including per curiams) published in the Federal Reporter from calendar year 1961 through 1990. The sample is stratified by year and by whether or not the decision was reviewed by the Supreme Court. While a completely random sample of appeals court decisions might be preferable, it was not practical to draw and code a large enough sample of appeals court decisions which would include enough cases accepted by the Supreme Court for review to make analysis meaningful. Our original sample of over 1100 published appeals court decisions contained only 18 cases reviewed by the Supreme Court. Therefore, we combined a stratified random sample of all published appeals court search and seizure cases in the 30 year period chosen for analysis with all other appeals court search and seizure cases reviewed by the Supreme Court.[3] This procedure

---

[2] Like Segal (1985), we find that models involving changing constants are superior to models involving changing parameter values of the independent variables. Of the models with changing constants, the one hypothesizing increasing conservatism with each term outperformed models hypothesizing (a) different constants for the Warren, Burger, and Rehnquist Courts, and (b) models suggesting increased conservatism for each replacement of a Warren Court justice with a Nixon, Ford, Reagan, or Bush appointee. The chi-squared for the term model was appropriately lower (177.71 for the term model versus 179.81 for the appointment model and 178.63 for the chief justice model), the percent predicted correctly was higher (77.95 versus 76.41 and 76.92) and the significance level of the change variable was lower (.0017 versus .0040 and .0029).

[3] To draw a stratified random sample by year, we first determined the population of appeals court search and seizure cases by searching Westlaw for all cases with the topic "searches and seizures," all Fourth Amendment cases, criminal law topics 219, 226, 364, 365, 394 and 207, plus several relevant combinations of keywords. The list of cases generated by these searches were put in a file, from which we took a stratified random sample of 40

resulted in 497 cases for analysis; 136 in which the Supreme Court granted review and 361 in which review was denied. The unit of analysis was the search. In those few opinions which discussed the validity of several unrelated searches, each search was coded separately. The coding rules employed by Segal (1984) were adopted for the coding of each of the case facts in the model described above.[4] Like Segal, we coded our dependent variable as 1 if the court either found the challenged search to be reasonable or allowed the evidence obtained from the search to be used; if not the dependent variable was coded 0.

The first step in our analysis was to determine, for each case in our sample of appeals court cases, the probability that the search at issue in the court of appeals would be upheld if the appeals court decision was reviewed by the Supreme Court. This probability (that the search would be upheld by the Supreme Court) was computed using the parameter values from the Supreme Court model. The log of the odds ratio of the probability that the search will be upheld (P_i) can be expressed by an equations of the form:

$$\log\left(\frac{P_i}{1-P_i}\right) = \alpha + \sum \beta_i X_i + \epsilon$$

where each of the "X's" are the case fact and attitudinal variables from the Supreme Court search and seizure model and the betas are the logit coefficients from that model. Substituting the actual values from the Supreme Court model, the following equation was used to generate the log of the odds ratio of the probability that each appeals court search would be upheld if reviewed by the Supreme Court:

where the first three variables indicate whether the search was incident to or after a lawful or unlawful search; the next two variables indicate whether the trial court determined that there

---

cases per year. Any case from our sample that turned out not to be a search and seizure case was replaced with the next listed case. For years in which fewer than 40 search and seizure cases were published, all published cases were included in the sample. From this sample, we selected for analysis all decisions in which the losing party petitioned the Supreme Court for review.

[4] It should be noted that like Segal we accepted the decision of the lower court as to whether or not subjectively determined facts, (e.g., whether or not there was probable cause) were present. That is, we coded case facts from the perspective of their status prior to the decision of the appeals courts.

$$\log\left(\frac{P_i}{1-P_i}\right) = -6.019 + 3.256\ incident + 1.049\ afterlaw$$
$$+ -.06\ unlawful + -0.234\ probcaus + 1.928\ warrant + -3.25\ home$$
$$+ -2.054 person + -2.733\ business + -2.243\ car + 1.411\ except$$
$$+ -1.766\ extent + 0.878\ US + 0.121\ term$$

was either probable cause for the search or that the search was conducted pursuant to a warrant; the next four variables indicate the location of the search (a home, person, business or car compared to the reference category of a location without a recognized expectation of privacy); the next variable (extent) indicates whether or not it was a full or limited search; the next variable indicates whether or not the United States was the government defending the validity of the search; and the last variable (term) is an indicator of the changing liberalism of the Supreme Court. Solving the equation for the value of P_i (i.e., P_i= antilog P_i / 1 + antilog P_i) yields an estimate of the probability that the search at issue in the court of appeals would be upheld if reviewed by the Supreme Court.

From this estimate we create an operational measure (CONFLICT) of whether the appeals court decision conflicts with Supreme Court policy. If the appeals court declared that evidence from the search was inadmissible, then CONFLICT is equal to the probability that the Supreme Court would uphold the search. Likewise, if the appeals court upheld the search, CONFLICT is equal to one minus the probability that the Supreme Court would uphold the search. Our measure of conflict with Supreme Court policy thus is a continuous variable with values from zero to one. If the Court utilizes an error correcting strategy, CONFLICT should be positively related to the dependent variable, the decision to review.

This estimate, along with our measure of ideological distance between the two courts, was then used in the construction of a model of Supreme Court decisions to grant review. All appeals court cases in our sample in which the losing litigant sought review were included in analysis (N=492). Since our dependent variable is dichotomous (1=review granted, 0= review denied) we utilized logit rather than regression to estimate our model. Our primary interest is the impact on the decision to review of two factors: 1) the ideological distance between the two courts and 2) the probability that the appeals court decision conflicts with Supreme Court policy preferences. Controls are added to the model for other variables that the literature on cert suggests are strongly related to the decision to review. As noted above, one of the most firmly established propositions from research on certiorari is that the United States is far more successful than any other litigants who seek Supreme Court review (Tanenhaus, et.al.,1963; Songer, 1979; Caldeira and Wright, 1988; Perry, 1991b). Since previous work also establishes that conflict (both on a given court or between different levels of the courts) is strongly related to the likelihood that the Supreme Court will

grant petitions for certiorari (Tanenhaus, et.al., 1963), it might be expected that the Court is more likely to grant review when there is either dissent on the courts of appeals or when the appeals court reverses the decision below. Thus, the model includes whether the United States is the party seeking review (if yes, US=1, otherwise US=0), whether the appeals court decision was unanimous (if no, DISSENT=1, otherwise DISSENT=0), and whether the appeals court affirmed or reversed the decision of the trial court (REVERSE=1 and REVERSE=0).

Findings

The coefficients in Tables 1 & 2 show the change in the log of the odds ratio for a Supreme Court decision on review. Since this coefficient is not readily interpretable, we provide under the column labelled "impact" the estimated increase or decrease in the probability that review will be granted when the variable in question is present. The impact estimate assumes otherwise there is a 50-50 chance of seeking review.[5]

Table 1 about here

As a partial check of whether the Supreme Court views petitions for review in search and seizure cases differently from those in other types of cases, we first ran a model that only contained variables that previous studies found to be significantly related to cert decisions. From Table 1 it is apparent that the factors which prior studies of broad based samples of cert petitions (i.e., those not limited to a particular issue area) found to be substantially related to the Court's decisions have similar effect in our sample of search and seizure cases. As predicted, the coefficients for both the United States as the petitioner and the presence of dissent in the courts of appeals are positive, strong, and statistically significant. A case which would have a 50% chance of being reviewed with some other petitioner will have a 88% chance of acceptance if the United States asks for review. Similarly, a unanimous decision with a 50% chance for review would see its chances increase to 85% if the appeals court panel rendered a split decision. As expected, reversal has a somewhat more modest impact, but one that is still positive and statistically significant. In sum, variables consistently found to play an important role in cert decisions in past studies appear to have similar effects on decisions to review search and seizure cases. These parallel findings give one some confidence that the significance of conflict for review decisions in search and seizure cases is not fundamentally different from its role in most other types of cases.

Overall, the model of Supreme Court review decisions performs

---

[5] At any other value, the estimated impact depends on whether the coefficient is positive or negative. Only at .50 is it symmetrical, and thus, nonarbitrary.

quite well. The model correctly predicts 80% of the decisions, achieves a reduction in error of 28%, and is significant at the .0001 level.

We next moved to the main focus of this study, the impact of the extent of policy conflict and ideological distance on whether the Court accepts the case for review. For this purpose we added the variables measuring conflict between appeals court decisions and Supreme Court policy, and ideological distance between the courts to the control variables included in the model in Table 1. In this revised model, displayed in Table 2, conflict is strongly related to the decision to review while the control variables continue to have effects similar to those noted above. The clear implication of Table 2 is that the extent of this conflict has a major bearing on whether the Supreme Court will review the decision. The coefficient for conflict is positive, robust, and significant at the .001 level. Similarly, the ideological distance between the appeals court panel and the Supreme Court is positively related to the likelihood of review to a statistically significant degree. Moreover, the addition of these measures of conflict and distance substantially improve the performance of the model, increasing the reduction in error from 28% to over 46%.

Table 2 about here

We display in Table 3 an example of how increases in the ideological distance between courts and the probability of conflict increase the likelihood of review by the Surpeme Court. The table displays, for cases with different combinations of the values of the variables in the model, the estimated probability that the case will be accepted for review. To make the presentation easier to interpret, the values of each of the other variables are held constant while the values of conflict and ideological distance are allowed to vary. As the data indicate, the probability of review increases steadily and sharply as both the measure of distance and the measure of conflict increase.

Table 3 about here

Another way to get a better intuitive feel of the significance of conflict for Supreme Court decisions to review is to examine the average degrees of conflict for cases reviewed and those not reviewed. For cases in which the Supreme Court turns down a petition for review, the mean probability that the decision of the court of appeals conflicts with Supreme Court policy is .187 with a standard deviation of .22. Since this mean value is 1.45 standard deviations below a conflict score of 50%, it means that in 92% of all cases denied review there is less than a 50-50 chance that the appeals court decision left undisturbed conflicts with Supreme Court policy. In contrast, for cases accepted for review, the mean probability of conflict is .563.

Discussion

Previous studies of the influence of conflict on cert decisions (Ulmer, 1983, 1984; Calderia and Wright, 1988; Armstrong

and Johnson, 1982; Songer, 1979) have consistently conceptualized conflict as a dichotomous variable: either there is or is not "real" conflict (with precedent or the values of judges or among circuits). In addition, previous studies (Ulmer, 1984; Caldeira and Wright, 1988) frequently assign cases to their dichotomous categories on the basis of subjective judgments that are not replicable. But we believe that the reality of the choice facing the justices is frequently less clear cut. Decisions below more frequently narrow or expand, to varying degrees, the preferred policies of the justices rather than directly "conflict" with them. And even when they are "objectively" in conflict, it is presumably difficult for a justice or clerk to determine with certainty whether a given decision is inconsistent with either Court doctrine or the policy preferences of the justice before the case is briefed and argued before the Court. Previous work, therefore, does not capture adequately the nature of the choice that justices must make (continually) when deciding which (if any) of several decisions below, all of which probably, but not certainly, conflict in part (to varying degrees) with their decisions, they should review. In contrast to the earlier works, the present study suggests that conflict should be conceptualized as a continuous variable and that it is possible to operationalize the conflict variable in an objective manner that can be replicated in future studies of search and seizure cases and easily adapted for analysis of other types of cases.

This paper demonstrates that both the degree of conflict between the appeals court decision and Supreme Court policy and the ideological distance between the two courts are strongly related to a decision to accept the case for review. The probability that a given decision below conflicts with Supreme Court policy clearly is strongly related to whether or not the decision is reviewed. But the same decision coming out of two lower courts may be interpreted quite differently by the Supreme Court, depending on who made the decision. If the lower court is ideologically close to the Supreme Court, even a decision that appears likely to be in conflict may escape review. Conversely, if the lower court is ideologically distant, then a less disparate decision may trigger a review. Such aggregate analysis tells us nothing directly about the perceptions or motivations of the justices. But the results suggest that the actions of the justices are very similar to what they would be if they were rational, policy oriented activists who were engaged in a struggle over doctrine within a hierarchy with hidden information, signaling, and monitoring as suggested by a principal-agent perspective. Of course, the strong evidence presented above of the political effects in review decisions does not mean that one can discount the possibility that legalistic concerns may also influence the Court's decisions. For example, we were not able to measure the degree of inter-circuit conflict and thus cannot say how much of the unexplained variance could be explained by that factor.

Prior studies created a puzzle: how to explain the apparent contradiction between findings which suggested the use of an error

correction strategy and the emphatic denial by the justices and their clerks that such a strategy is employed. Our findings suggest that both perspectives miss at least part of the dynamic of what is actually going on. The evidence is strong that the apparent degree of conflict between the decision below and Court policy affects the review decision in spite of the insistence of the justices and clerks that more legalistic concerns usually are determinative. If the conflict is great enough, the decision has a very high probability of being reviewed. But on the other hand, the Court does not appear to follow a straightforward error correction strategy. If it did, the same "mistaken" decision coming out of either a liberal or conservative panel should have the same probability of review. In contrast, the chances of review are substantially higher for decisions coming from panels that are ideologically distant from the High Court. But if what is going on is a signaling/auditing game under incomplete information, with the point being the creation or shaping of judicial policy, then the finding that both conflict and the ideological make-up of the panel below matter makes sense.

Our results are limited in that we only examine one issue area, search and seizure cases. We know of no reason to believe that access decisions for other types of cases are influenced by substantially different factors, and this confidence is bolstered somewhat by the parallelism of the findings in Table 1 and those of studies which were not limited by type of case. Nevertheless, one must be cautious in generalizing from a single case type. At a minimum, the results suggest that it may be fruitful to investigate the utility of a principal-agent perspective to access decisions in other issue areas (e.g., death penalty cases and obscenity) in which fact pattern analysis has been applied to develop well specified models of Supreme Court decision making.

WHITHER SOCIALISM IN LATIN AMERICA AND THE CARIBBEAN: THE CONTINUING RELEVANCE OF NON-REVOLUTIONARY PROGRESSIVE POLITICS

Eric Selbin
Department of Political Science
Southwestern University
Georgetown, TX 78627-0770
e-mail: eselbin@ralph.txswu.edu

This is a very rough draft; Comments are welcome, but please do not cite without permission

Prepared for Delivery at the 1993 Meeting of the American Political Science Association
The Washington Hilton, Washington, D.C. 2-5 September 1993

"Capitalism," we are repeatedly assured, has triumphed, thereby bringing us to "the end of history."[1] "Socialism," "communism," "revolution," and other such terms related to non-capitalist alternatives and attacks on the status quo have all been consigned to the margins of history, mere footnotes in capitalism's victorious march since supplanting feudalism. Only a very few and very recalcitrant hardliners--Cuba's Castro, North Korea's Kim Il Sung, and some assorted Islamic fundamentalists--dare resist the inevitable tide of neo-liberalism that is sweeping across the world.[2] "Communism" as practiced by the former Soviet Union and its allies has collapsed, China has embraced the "free market," and the socialist experiments on the African continent seem largely abandoned. "Neo-liberalism" holds sway in Latin America and the Caribbean; proof for some that the region historically partnered with North America is finally mature enough, sophisticated enough, to truly be partners.

The contentions here are simple: we are nowhere near "the end of history"[3]--in any meaningful sense--and despite the triumphant proclamations of conservatives and their liberal/neo-liberal and right-wing allies and the apprehension of progressives, the non-revolutionary progressive politics in Latin America and the Caribbean retains great appeal for the majority of people in the region. This is not surprising since the "neo-liberal reforms" introduced throughout the region have done little or nothing to promote the social welfare of profoundly impoverished populations: more people in Latin America and the Caribbean live in poverty today than did ten years ago.[4] Moreover, in practice these "reforms" may well undercut the very democratic processes we are told that they portend. The leftists, progressives, and socialists of Latin America and the Caribbean offer the region's destitute and dispossessed--the immense majority of people--the greatest, perhaps only hope for a better future for themselves and their children.

Progressive politics in Latin America and the Caribbean is more powerfully positioned than ever before in its history. The current glorification by the popular press and many academics of the experiments in the region with "free market reforms," eerily reminiscent of previous premature

---

[1]F. Fukuyama, "The End of History," *The National Interest*, vol. 16 (Summer 1989). Fukuyama's "end of history" is denoted by "the triumph of liberal democracy, rule of law, and free-market principals...." T. Rosenberg, "Latin America's Magical Realism," *Wilson Quarterly* (Autumn 1992).

[2]Some conservatives include the current U.S. Administration among these. See, J. Gray, "The Left's Last Utopia: Amerika (sic) the Beautiful," *National Review*, vol. 45 no. 14 (19 July 1993).

[3]This is neatly summed up by Osorio, who argues that "the collapse of the socialist experiences did not put an end to history. For enormous social contingents, for the millions of poor and exploited, history has not even begun." J. Osorio, "Liberalism, Democracy, and Socialism," *Social Justice*, vol. 19, no. 4 (1992). Castañeda advances the peculiar notion that "the collapse of socialism has meant the loss of a paradigm" with the result that while history has not ended, the "idea of the future" has, leaving Latin America without a future. "The only thing left to fight for is a future that is simply the present, plus more of the same." J. Castañeda, "The Decline of Communism and the Latin American Left," *Problems of Communism*, vol. 41, no. 1-2 (January-April 1992), pp. 186-7.

[4]A. Lowenthal, "Latin America: Ready For Partnership," *Foreign Affairs*, vol. 72, no. 1 (1992/1993), p. 85. Along these lines, see, Castañeda, p. 183; C. Vilas, "What Future for Socialism?," *NACLA Report on the Americas*, vol. 25, no. 5 (May 1992), p. 14; and C. Vilas, "Latin America: Socialist Perspectives in Times of Cholera (Preliminary Notes for a Necessary Debate)," *Social Justice*, vol. 19, no. 4 (1992), p. 76. This point is developed further in the next section of this paper.

celebrations heralding the permanent arrival of democracy, obscures the prominence of the region's left.[5] Over the last ten years leftists, progressives, and socialists have availed themselves of that most radical method of change, the ballot box, to come to power, share power, or position themselves as the significant and loyal opposition in Argentina, Bolivia, Brazil, Chile, Colombia, the Dominican Republic, Ecuador, Guyana, Jamaica, Mexico, Nicaragua, Peru, Uruguay, and Venezuela.[6]

There is not some monolithic force of leftists, progressives, and socialists cutting a swath across the region. The diversity of the progressive forces which have emerged with the return of the military to the barracks and the arrival of democratic procedures is impressive, representing strategies from a renewal of traditional left politics in the region to a complete break with that past. Despite their often dramatic differences, the characteristic shared by political forces such as the Radical Party in Argentina, the Worker's Party in Brazil (PT), both the Socialist Party and the Party for Democracy in Chile, Colombia's M-19, the FMLN in El Salvador, Mexico's Democratic Revolutionary Party (PRD), Nicaragua's Sandinistas, the Broad Front in Uruguay, and both the Movement to Socialism and the Radical Cause in Venezuela, is the one which has defined progressive politics since the Industrial Revolution--a commitment to social justice.

In later stages the project which this paper is the precursor to will explicitly explore the differences and distinctions among the various progressive forces in the region--i.e., *which* left--and wrestle with the question of *which* of these forces seem to be on the rise--such as Brazil's PT--while others--Mexico's PRD, for example--are on the wane.[7] These critical and intriguing questions are, however, beyond the scope of this paper. The focus in this preliminary effort is on space; more specifically, on why in this triumphant heyday of neo-liberalism there is not only an opening for the progressive forces of Latin America and the Caribbean, but a veritable vacuum into which they might step.

It is important not to exaggerate. Just as the advent of "neo-liberalism" may well have been driven by the paucity of credible alternatives for solving the wide-spread economic failures which had become endemic to Latin America and the Caribbean, so too may the current strength of the region's progressives be predicated on the dearth of good alternatives for confronting the

---

[5]Latin America has witnessed several waves of democracy since independence. There are some circumstances that make this round of enchantment with democracy different than the previous cycles through. A thoughtful explication of these may be found in M. Seligson, "Democratization in Latin America: The Current Cycle," in J. Malloy and M. Seligson, eds., *Authoritarians and Democrats: Regime Transitions in Latin America* (Pittsburgh: University of Pittsburgh Press, 1987). I remain hesitant to join the chorus proclaiming that democracy is here to stay.

[6]In 1992, Lowenthal points out, there have been electoral gains for "the Worker's Party and Social Democratic Party in Brazil, the Movement to Socialism and the Radical Cause in Venezuela, the Broad Front in Uruguay, the M-19 in Colombia and the Radical Party in Argentina." Lowenthal, p. 79. To this list could be added the election of Dr. Cheddi Jagan, a Marxist, in Guyana.

[7]One of the first opportunities to make such an assessment may be in December's Venezuelan presidential election. Venezuela's left has what Rosen describes as "an historic opportunity to assert itself on the national scene--if it has a credible program." Yet as Rosen goes on to point out, Venezuelans will have to choose between two distinct progressive forces, the Movement Toward Socialism (MAS) and Causa Radical. They represent, he contends, "two different styles of organizing and two distinct models of social transformation." F. Rosen, "Which Left for Venezuela?" *NACLA Report on the Americas*, vol. 26, no. 4 (February 1993), p. 3.

monumental social debacle that is commonplace throughout the region.[8] As a result, it would be premature to read the electoral successes enjoyed by progressive forces in the region as constituting or even presaging a profound socio-political transformation for the region.

Nonetheless, captivation with the notion that progressive forces in Latin American and Caribbean have somehow been, as one scholar puts it, "defeated" by "the fall of communism in Eastern Europe and the Soviet Union,"[9] ignores reality. Leftists, progressives, and socialists in Latin America and the Caribbean challenged and survived the brutal and relentless campaign of ideological cleansing led by the region's militaries.[10] As a result of their stamina and their suffering, they retained and often broadened their pre-dictatorship base and emerged scathed but with a set of important and significant credentials to many people in the region.

Progressive politics in Latin America and the Caribbean undoubtedly requires reevaluation and rethinking--perhaps even a "rebirth."[11] Despite its apparent disarray, however, it is nonetheless progressive politics in its various forms and guises that would appear to be well placed to solve the monumental problems that confront the region. If that is the case, than non-revolutionary[12] progressive politics in Latin America and the Caribbean is neither in decline nor

---

[8]Some have even suggested that the advent of democracy in the region has less to do with the intrinsic merits of democracy than a sort of satisficing wherein all sides were "forced to conclude that they would do better by settling for a 'second-best' outcome"--democracy. L. Whitehead, "Alternatives to Liberal Democracy: a Latin American Perspective," *Political Studies*, vol. 40, Special Issue (1992), p. 148.

[9]Castañeda, p. 182. A particularly insightful response to analyses such as Castañeda's is C. Vilas, "Soviet Collapse Not So Relevant," *NACLA Report on the Americas*, vol. 25, no. 5 (May 1992), p. 15.

[10]The widely remarked upon staying power of the region's progressive forces is neatly summed up by Hagopian, who notes that "throughout the Southern Cone of Latin America, the populists and socialists whom the military regimes had hoped to banish from the political scene survived military rule and resurfaced with significant constituencies." F. Hagopian, "After Regime Change: Authoritarian Legacies, Political Future, and the Democratic Future of South America," *World Politics*, vol. 45, no. 3 (April 1993), p. 464. While progressive forces were not the only ones to have challenged the repressive dictatorships, it merits mention here that the attacks on progressive forces were invariably aided and abetted by the right and conservatives in each country, as well as the U.S. embassy, and in some cases by moderates and centrists.

[11]The need for reevaluation and rethinking is briefly limned out in I. Roxborough, "Neo-Liberalism in Latin America: Limits and Alternatives," *Third World Quarterly*, vol. 13, no. 3 (1992), p. 431. More thorough analyses can be found in *NACLA Report on the Americas* issue entitled "The Latin American Left: A Painful Rebirth," *NACLA Report on the Americas*, vol. 25, no. 5 (May 1992). See, in particular, C. Vilas, "What Future for Socialism?;" J.C. Portantiero, "Foundations of a New Politics," *NACLA Report on the Americas*, vol. 25, no. 5 (May 1992); and J. Arico, "Rethink Everything (Maybe It's Always Been This Way), *NACLA Report on the Americas*, vol. 25, no. 5 (May 1992). A very interesting analysis of some of these notions in practice is M. Keck, "Brazil's PT: Socialism as Radical Democracy," *NACLA Report on the Americas*, vol. 25, no. 5 (May 1992). The influence of Brazil's PT on the revitalized Latin American left is outlined in W. Robinson, "The São Paulo Forum: Is There a New Latin American Left?," *Monthly Review*, vol. 44, no. 7 (December 1992).

[12]While armed revolution has declined for the moment, or so says the conventional wisdom, those who are prepared to sound the death knell for either the concept of revolution or the region's revolutionaries seem awfully premature. This view is echoed, from a slightly different perspective, in a recent *Latin American Weekly Report* article, "Are Guerilla Insurgencies on the Wane?," *Latin American Weekly Report* WR-93-23 (17 June

(continued...)

in crisis and remains a valuable and relevant reference point.[13]

The remainder of this paper will focus primarily on the increasingly apparent contradictions of neo-liberalist policies and their abject failure to speak to either the pressing social conditions of scarcity and privation or to insure meaningful consolidation of democracy in the region. The associated issue of the relationship between progressive politics and democracy in Latin America and the Caribbean--what it has been and what it has to offer--will also be considered. A very brief final section will suggest some possible case studies.

Neo-Liberalism: Economic Failure and The Frailty of Democracy

Prodigious positive publicity has been accorded to the adoption over the last decade of "neo-liberal" economic policies in Latin America and the Caribbean. These neo-liberal policies have been succinctly described as "extreme versions of free-market economics."[14] The result, ironically, is that "neo-liberalism" is "often characterized by a crude economic determinism of the type we used to associate with vulgar Marxism."[15] To date, the "free-market" has not proved the promised panacea; in fact, so far the solution would appear to be worse than the cure. With one or two notable exceptions, the 1980s found the economies of Latin America and the Caribbean in shambles. .The chosen solution--heavily promoted by the U.S., albeit with varying effects[16]--was "neo-liberalism." Such free-market policies were hardly new, the regions military dictatorships had tried them throughout the 1960s and 1970s with little or no success.[17] Nonetheless, the "Chilean economic miracle" was trotted out to be the proof of the possibilities, despite serious

---

[12](...continued)
1993), p. 270. It strikes me as extremely unlikely that the current lull (in relative terms) in what might be considered revolutionary activity will last out the century. Although very uncomfortable with the deterministic undertones, I am reminded of Thomas Jefferson's dictum that revolutions are as inevitable in the political world as storms in the natural.

[13]"Decline" is the description of Castañeda; "crisis" that of R. Harris, *Marxism, Socialism, and Democracy in Latin America* (Boulder: Westview, 1992), p. 194.

[14]I. Roxborough, "Latin America: Still in Trouble: The Triumph of Neo-Liberalism," *Dissent* (Fall 1992), p. 486.

[15]Whitehead, "Alternatives to Liberal Democracy: a Latin American Perspective," p. 152.

[16]The Reagan administration, Rosenberg contends, "had little direct influence on Latin American policy-makers. Despite the claims of administration officials that their conservative thinking helped sway the Latins, their relations with most Latin advocates were sop poor that advice from Washington was almost enough to guarantee that its recipients would run in the opposite direction." Rosenberg, p. 69.

[17]Rosenberg points out that "free-market policies" have been tried before and failed; she cites Argentina 1976-1983, Brazil 1969-1973, and Chile 1975-1983. Rosenberg, "Latin America's Magical Liberalism," pp. 72. This point is echoed in Roxborough, "Latin America," p. 486.

questions about whether it was either particularly miraculous or replicable.[18] Chile's success in its second go round with neo-liberal policies, Rosenberg contends, had less to do with neo-realism and more to do with favorable commodity prices, a huge World Bank loan, and "what Chilean economists consider just as important...*more government regulation.*"[19] The "free market" was touted as the solution to the various and asundry ills that disparage Latin America and the Caribbean. In particular, "free-markets" would overcome economic adversity and instantiate liberal democratic practices.

Although the numbers may be debated along the margins, the number of people living in poverty in Latin America and the Caribbean is staggering. Anywhere from just under one-half up to two-thirds of the people in the region[20]--somewhere between 200 and 300 million people[21]--live in poverty and do not enjoy "stable access to food, employment, health, and education."[22] Just in Latin America, according to conservative estimates, more people live in poverty today than did in 1980;[23] in 1990, 71 million more Latin Americans were living under the official poverty line than had been in 1970.[24]

The gap between the wealthy and the poor is worsening and various divisions--social, economic, and ethnic--are widening.[25] Mandated by the "neo-liberal reforms," drastic spending

---

[18]As Rosenberg points out, the "economic miracle of Chile" proves what many in Latin America believe, that the benefits of neo-liberal policies "will go to society's elites while the poor bear the cost." Rosenberg, p. 70. One interesting back and forth on this debate can be found by reading J. Kandell, "Prosperity Born of Pain," *The New York Times Magazine* (7 July 1993), pp. 14-18, 33, 35 and the response/critique by J. Petras and S. Vieux, "Jon Kandell and the Chilean Miracle," *Lies of Our Times* (September 1991), pp. 19-20. Petras and Vieux extend their critique more broadly in "Latin America's Free Markets," *Monthly Review*, vol. 44, no. 1 (May 1992).

[19]Rosenberg, p. 73. Emphasis added.

[20]The U.N. Economic Commission on Latin America estimates that 44 percent of Latin Americans live at poverty levels. See Petras and Vieux, "Latin America's Free Markets," p. 9 or Lowenthal p. 85. The figure of roughly one-half is commonly encountered; Castañeda (p. 183), for example, puts the figure at 240 million. Vilas cites the United Nations Development Project estimate that two-thirds of the total population of Latin America live in poverty (Vilas, "Latin America: Socialist Perspectives in Times of Cholera," p. 76).

[21]These numbers are derived from the World Banks population estimates for the region. For reasons that are not clear to me, the 1993 World Bank *World Development Report: Investing in Health* (New York: Oxford) lists five different population figures for Latin America and the Caribbean. On p. 199 the 1991 estimate is put at 455 million; on p. 201 the 1990 estimate is put at 444 million; on p. 212 a "mid-1990" estimate is for 444,297,000; on p. 239 the "mid-1991" figure is 445,300,000; finally, on p. 289, the 1991 estimate has mysteriously dropped 10 million to 445 million. Which ever number one chooses to use, a huge number of these people live their lives under miserable conditions.

[22]Vilas, "Latin America," p. 79.

[23]3 percent more, according to Lowenthal, p. 85.

[24]Vilas, "What Future for Socialism," p. 14.

[25]Lowenthal, p. 79. Examples of these gaps can be found below.

cuts have come in the areas of "education, health, housing, and assistance to the poor."[26] As the reforms benefit the economic elite, the cost is borne by the poor, whose impoverishment increases apace. Latin America's distribution of income is "more unequal than in any other major region of the world."[27] Over 180 million people "survive without basic necessities...; many of these subsist in extreme poverty, unable to maintain the minimum caloric intake required for human health."[28] The overall number of those in extreme poverty overall may be "nearly half;"[29] in some Latin American countries over 75 percent of the population live in extreme poverty.[30]

Specific cases can be illuminating. In Chile, the widely touted "miracle," the government's own statistics showed that from 1979 to 1989 the "the proportion of national wealth owned by the top 20 percent of the population rose from 51 to 60 percent" and that by 1988 "the buying power of a worker was 25 percent less than it was in 1970."[31] Perhaps more shocking, drastic cuts in health care--from a high of US$29 per capita in 1973, the last year of the Allende government, to US$11 per capita in 1988--have shown up in the appearance of diseases typically associated with poverty such as typhoid and viral hepatitis.[32] Across the region there has been a direct correlation between neo-liberal programs that have slashed spending on health care and related items--sewage treatment, clean water, etc--and the return of diseases previously thought to have been eradicated--cholera has swept the continent in step with neo-liberalism.

Other instances abound. In Argentina, Minister of Health Julio Cesar Araoz "admitted that one-third of the population lives in poverty."[33] In 1980, according to UNICEF figures cited by Vilas, "the poorest 10% of Guatemala's population received 2.4% of the national income; today that 10% earns only 0.5%. That means that each of these nearly 900,000 Guatemalans earns an average of *four dollars* a month."[34] In Mexico socioeconomic conditions are as bleak as the political conditions, and there are reliable reports of nascent revolutionary movements in the south, and, according to World Bank figures cited by Castañeda, "life expectancy for the poorest 10 percent of the population was 20 years less than for the richest 10 percent."[35] 50 per cent of

[35]Castañeda, p. 183.

Venezuelans have "only enough money to eat once a day."[36] It is thus not surprising that Venezuelans frustrated with "sacrifice at the bottom and corruption at the top" have widely supported several coup attempts and will likely support another.[37]

Brazil, with one of the world's largest economies, is a striking example. According to the World Bank, Brazil has the highest per capita income in Latin America--not surprising for one of the world's 10 largest economies--but they also point out that Brazil has the "most unfair income distribution of any major nation in the world. The top 20 percent of Brazil's population earns 26 times what the bottom 20 percent earn. In the US the disparity is 9 to 1; in India it is 5 to 1."[38] In Brazil, 53 percent of the national wealth is held by 1 percent of the population.[39]

The result, as one scholar points out, is that the advances Brazil "made in reducing poverty during the previous 20 years...were virtually erased. Between 1960 and 1981, the number of poor in Brazil dropped from 36 million to 24 million, and more strikingly, from 50 percent of the population to 19 percent. However, by 1987, there were 33 million individuals, or 25 percent of the country's inhabitants, living beneath the official poverty line."[40] In 1993 President Itmar Franco declared that Brazil was in a "state of social emergency" and that "starvation and misery will become the government's main problems."[41] Brazil is not unique in this--Mexico, Peru, and even Argentina have announced similar anti-poverty drives[42]--and it is no accident that the polls for the next presidential election are led by the Lula da Silva, the leader of the Worker's Party.[43]

The best illustration and summation, Rosenberg suggests, may be found in Bolivia. Drastic cuts in government spending, currency devaluations, freeing interest rates, liberalizing tariffs, and removing subsidies--"in other words, following the liberal model being promoted throughout the

[42]"Menem Joins the Throng and Announces A Massive Anti-poverty Drive," *Latin American Weekly Report* WR-93-03 (21 January 1993), p. 25. The article notes that only a few months before Menem had branded "those who dwelt on the spread of poverty in Argentina as 'liars'."

[43]Lula led handily in polls in March 1993 and in June 1993. The March poll is reported in "Data FOLHA Poll Shows Lula Most Popular Politician," FBIS-LAT-93-056 (25 March 1993), p. 34. The June data is reported in "Cardoso's 'Non-Plan' Could Become Stepping-Stone to the Presidency," *Latin American Weekly Report*, WR-93-25 (1 July 1993), p. 289.

world by such 'shock therapy' gurus as Harvard's Jeffrey Sachs"--has dramatically reduced inflation and produced minimal per-capita growth of 1 percent or less a year.[44] Yet, as Rosenberg points out, "Bolivia remains the poorest country in South America and living standards for the great majority have not improved....If Bolivia is an example of success, what is a failure?"[45]

Democracy--specifically Western democratic procedures--have been far more successful in Latin America and the Caribbean this go round. Democracy is wider--if not necessarily deeper--than after World War II, in the 1920s, or in any of the previous cycles. During the 1980s the trend toward democracy was strong and steady and almost every country in the region has had a free, open, and fair election in the last few years. While one election does not a democracy make, many of these countries have had more than one election and even witnessed the peaceful transfer of power between opposing parties. These are no small feats in a region notoriously cool toward democratic procedures and the relinquishment of office. Equally striking has been the attention to, if not necessarily respect for, human rights and dignity and some of the tangible efforts made in these areas.

But since 1990 it has been clear that all is not well. Many of these democracies are not entirely inclusive, often based on elite pacts and the continued marginalization of the region's indigenous population, and there have been notable setbacks--The *autogolpe*, dubbed a "Fujicoup," in Peru, the coup in Haiti, the popularly supported coup attempts in Venezuela and popular calls for a coup in Panama, the role of Guatemala's military in first supporting than destroying a recent effort to emulate the "Fujicoup" with a *Serranazo*, and recent ominous noises from the military and its partisans in both Brazil and Chile. As for human rights, while the generals are back in their barracks, they have left their legacy and retain their minions. A palpable sense of justice has not yet taken hold in much of the region and death squads remain active in a number of countries, most notably in El Salvador, Peru, Guatemala, and Brazil; street children seem to be a particular target in these latter two.

There are a wide and impressive array of obstacles confronting the instantiation of Western democratic practices in Latin America and the Caribbean.[46] Three stand out: (1) despite the delight in the very real trappings of liberal democracy, many people of all types remain highly suspect of democratic procedures; (2) neo-liberal economic policies undercut democratic political practices; and (3) Western conceptions of democracy lack a social component that is critical for a region such as Latin America and the Caribbean. The suspicion of democracy will be dealt with here only briefly; it merits much greater consideration than can be devoted here. The problems inherent in the pursuit of neo-liberal policies will be addressed here. The absence of a social component from Western conceptions of democracy will be addressed at length in the next section of the paper.

---

[44]Rosenberg, p. 70.

[45]Rosenberg, p. 70. According to the U.N.'s International Fund for Agricultural Development (IFAD), Bolivia has the highest percentage of rural poor in the world--97 percent of Bolivians live under the poverty line. IPS "Latin America: 76 Million Poor in Rural Areas, IFAD Says," Inter Press Service (26 November 1992), p. 1.

[46]Five "points of strain and tension" suggested by Roxborough are "the arrogation of power to the presidency, popular explosions of outrage, the erosion of corporatist mechanisms of conflict resolution, and labour conflict." Roxborough, "Neo-Liberalism in Latin America: Limits and Alternatives," p. 427.

Suspicions of Democratic Procedures

The suspicions of democracy cut across a wide array of people and are probably to be expected in a region where the experiences with democracy have been so convoluted. Elites in the region have long viewed democracy as a threat to their "natural" position of power; they have seen relatively little to gain by expanding the inclusiveness of their respective political systems. For many of these people, the utility of democracy is limited to what it buys them in the perception of the rest of the world and most importantly the United States.

For many of the poor, democracy is a term that has long been associated with a formality dictators have used to placate foreign powers or soothe their own conscience;[47] it has rarely if ever had any tangible meaning to their daily existence. While almost everyone in the region can now vote in the regularly scheduled and largely democratic elections, on a daily basis the immense majority of people are confronted daily "with societies whose basis is power, not law."[48] The bureaucracy and the courts remain privileged provinces of the powerful, ever upholding the control of the wealthy and powerful over society.

This general distrust of democracy, for reasons that will be explored in the next section, has even spread to those who have most enthusiastically embraced it, the middle class and technocrats. In the economic arena, these people are challenged by byzantine bureaucracies and business relations that are more like family relations.[49] Politically, those who at least initially seemed most enthusiastic about democracy and neo-liberalism--and largely remain committed to the neo-liberalist project--are increasingly wary of the repercussions of allowing the majority of the population to express their will. This is a conundrum with profound implications for the instantiation of democracy in the region.

The tradition of electoral democracy in Latin America and the Caribbean has been fragile and ambivalent outside of a few notable and oft invoked exceptions such as Chile, Costa Rica, and Uruguay. Pollsters increasingly find that "most people still favor democracy as a form of

---

[47]In Nicaragua, for example, "Somoza had frequently called elections and, thus, had legitimized his dictatorship, if only in the eyes of the United States, by winning all of them with huge majorities. So 'election' for most people in the crowd was a word which meant trickery. 'No election' was a promise to them of no trickery." G. Greene, *Getting to Know the General* (New York: Simon and Schuster, 1984), p. 187. The Somoza family's cynical manipulation of elections staged for their benefactors in the U.S. was hardly original, but rendered elections for most Nicaraguans "little more than automatic ratification of candidates chosen by the incumbent party and the U.S. government." LASA, "The Electoral Process in Nicaragua: Domestic and International Influences," Report of the Latin American Studies Association Delegation to Observe the Nicaraguan General Election of November 4, 1984. Austin: LASA (1984), p. 4. Following in the footsteps of his father and brother, the elections of the final member of the Somoza "dynasty," Anastasio Somoza Debayle, "featured translucent ballots, the buying of votes, intimidation, and, when all else failed, stuffed ballot boxes." LASA, "Electoral Democracy Under International Pressure." The Report of the Latin America Studies Association Commission to Observe the 1990 Election. Pittsburgh: LASA (1990), p. 7.

[48]Rosenberg, p. 62.

[49]Rosenberg argues that "most Latin countries that have the formal attributes of democracies and free-market economics operate just below the surface, like the *anciens régimes* of premodern Europe." Rosenberg, p. 62.

government but are increasingly skeptical of all democratic political institutions."[50] Successful *golpes d'estado* in Peru and Haiti and popular support for such efforts in Venezuela and Panama serve as powerful reminders of the frailty of democracy.

Neo-liberal Economic Policies-vs-Democratic Political Practices

The problem, in short, is that the demands of an impatient and increasingly impoverished electorate inevitably clash with the demands of the economic elite. The proclivity of people in the U.S. to view democratic practices and open, or at least relatively open, markets as dialectically related runs aground in the context of Latin America and the Caribbean.[51] Lowenthal argues that, "in Latin America's circumstances, as in those of eastern Europe and east Asia, the claims from impatient electorates and the demands of economic elites are not easily reconciled. Careful management of this tension is needed, rather than blind ideological faith that the market's hidden hand will produce positive results."[52]

That "blind ideological faith" in the free market is exactly what is being used, according to one scholar of democracy in the region, to "to shape strategies of democratization."[53] From the neo-liberalist perspective, their "economic reforms--monetary stabilization, privatization, the enhancement of private property rights, and 'openness'--will also in due course provide the social foundations for consolidated liberal democracy."[54]

While this might happen, neo-liberalist assumptions about the connection between free markets and participatory democracy rest on a very shaky foundation. While this will be explored further below, it merits note in Chile, the case most commonly invoked to prove the suitability and prowess of neo-liberal theories, democracy has yet to be consolidated. Moreover, the degree to which Chile has been successful in this regard owes more to the country's 150 year tradition of healthy democracy that was interrupted in 1973 by a brutal military dictatorship and its "civil society, social consensus, rule of law, well-run public institutions, and strong, legitimate state."[55]

Internal tensions "between the imperatives of political and economic liberalization, between the opening of democratic politics and of market economies" are real.[56] One obvious tension, discussed above, is between the haves and the have-nots. There are other tensions which merit mention here as well and are suggested in the work of Lowenthal and Whitehead: (a) the old elite-vs-the new elite; (b) the use of undemocratic methods to secure democracy; and (c) the role of the state in a developing society.

---

[50]Lowenthal, p. 83.

[51]As Lowenthal puts it, "for reasons of national experience and ideology, people in the United States like to think of these processes as not only compatible but as necessarily related--as two sides of the same coin, united by the element of free choice." Lowenthal, p. 87.

[52]Lowenthal, p. 87.

[53]Whitehead, p. 153.

[54]Ibid.

[55]Rosenberg, p. 74.

[56]Lowenthal, p. 87.

The Old Elite-vs-The New Elite. There are naturally those who have profited in the past who are opposed to the neo-liberal reforms; they may be powerful and they may be willing to fight. These are the wealthy who have benefitted from the old system: the protection of the state, state subsidies, patronage, high tariffs, controlled prices, etc. These are the people Rosenberg refers to with her term "magical liberalism," which invokes the Latin American literary style of "magical realism" to denote "a highly fanciful semblance" to liberalism.[57] Such Latin American liberalism has endured, she argues, due to a decided lack of substance. They have been, in this sense, *liberales de fachada*, facade liberals, highly dependent on the region's states to take care of them.[58]

Undemocratic Methods in Pursuit of Democracy. In explaining the overthrow of the democratically elected Guatemalan government in 1954, U.S. Secretary of State John Foster Dulles offered the immortal explanation that some times you must destroy democracy to save democracy. In the effort to attain a consolidated liberal-democratic state, neo-liberalism commonly--perhaps even by definition--involves decidedly non-liberal, non-democratic behavior. The problem arises when those who realize little or no gain or fare worse from the reforms exercise their democratic rights to oppose the reforms proposed by the neo-liberal policy-makers. This is exacerbated when, in an effort to "depoliticize" the economy, "policy-makers are insulated from social feedback, if media criticism is restrained, and if the resistance to new patterns of property ownership is met with the full force of bourgeois (not necessarily democratic) law."[59]

> The slippery slope here--and potential for great tragedy--is clearly that, once neo-liberal theorists have condoned such *means* to achieve their allegedly democratic rule *ends*, the old, old question arises as to how, if at all, they are to eventually free themselves from the instruments that they have used. The ideological and intolerant *style* of neo-liberal policy-making is well illustrated by the fact that whenever the observable results fall short of what was promised by the theory, the typical response has not been to reconsider the doctrine but to proscribe a stronger dose of the same medicine.[60]

Just as Stalinists might once have bemoaned the "false consciousness" of subject populations, so now the neo-liberals find the flaws in the people not the program.

The Role of the State. If neo-liberal policies are successful, what will the ensuing democracy look like? In particular, what would the role of the state be? *Participatory* democracy, as Whitehead points out, "tends to clash with the ideal of a 'depoliticized' market system, and far from advancing such causes as women's rights, racial equality or a social rights conception of

---

[57]Rosenberg, p. 60.

[58]This is, obviously, a reference to *democracias de fachada*, facade democracies. On such democracies see Solorzano Martinez 1983 and E. Herman and F. Brodhead, eds., *Demonstration Elections: U.S. Staged Elections in the Dominican Republic, Vietnam, and El Salvador* (Boston: South End Press, 1984). Whitehead also refers to facade demos and the Portuguese phrase "*para os ingleses ver*, which refers to the old habit of holding elections 'for the English to look at'." Whitehead, p. 150. Whitehead than goes on to make the interesting argument that facades can become real. While attention to propping up the facade may well lead to some positive changes--changes not to be discounted--no facade to date seems to have made the transition.

[59]Whitehead, p. 153.

[60]Ibid. Emphasis in the original.

citizenship, the neo-liberal model tends to dismantle whatever protections may previously have existed."[61]

Neo-liberal policy-makers are--in yet another odd echo of Marxism--committed to the dismantling if not destruction of the state: "streamlining...and ridding them of excess functions and personnel."[62] At the same time, there is the obvious need to provide critical public services and equitably distribute the national wealth. Lowenthal goes so far as to argue that "a central task" for many Latin American countries in the 1990s is "building effective state capacity--rather than further cutting back the state."[63]

In sum, the complications, contradictions and possibilities are many. While there may be some successes that neo-liberalism can point to, it is far from clear that economic development can be sustained or democracy consolidated. The guaranteed economic success of neo-liberal policies in Latin America and the Caribbean does not seem to be materializing and the success stories to date are certainly not at the rates or with the breadth or depth that were promised.[64] More countries in the region, including Argentina, Brazil, Mexico, and Peru, are announcing the adoption of "anti-poverty" programs in an effort to close the incredible gap between the rich and the poor.

This is, sadly, true not just in economic terms, but in political terms as well. Neo-liberal policies have presented the region's democracies with the paradox of accepting what Whitehead calls "a stunted version of liberal democracy" that "would seem to exclude many of the features commonly associated with full liberal democracy (high participation, authentic political choice, extensive citizenship rights)" or "a generous version of social democracy" that can not be consolidated.[65] It is to this latter point, the question of whether or not a more authentically democratic practice can be consolidated in the region, that we turn to.

Democracy and Socialism in Latin America and the Caribbean

In the next three years there will be at least twenty major elections in Latin America and the Caribbean; given the parliamentary systems common throughout the Eastern Caribbean there will likely be more. In all of these elections progressive forces stand a good chance of coming to power; in some of the cases which will be most closely watched--Brazil and Venezuela--

---

[61]Whitehead, pp. 153-4. "In what sense," Whitehead wonders, "would it be democratic at all?" Whitehead, p. 153. Whitehead here cites Mcpherson to the effect that "unfortunately, liberal democracy can mean either...freedom of the stronger to do down the weaker by following market rules; or it can mean equal effective freedom to use and develop their capacities. The latter freedom is inconsistent with the former." CB Mcpherson, *The Life and Times of Liberal Democracy* (Oxford: Oxford University Press, 1979), p. 1.

[62]Lowenthal, p. 88.

[63]Ibid.

[64]Even those who have been most sympathetic to neo-liberal policies seem to recognize this. See, for example, N. Nash, "Argentines Escape an Economic Mire: A Success Story, Yes, but No Miracle," *New York Times* (25 July 1993), p. A6. It merits mention that Nash chooses to ignore Menem's announcement of a massive anti-poverty program. See, "Menem Joins the Throng and Announces A Massive Anti-poverty Drive," *Latin American Weekly Report* WR-93-03 (21 January 1993), p. 25.

[65]Whitehead, p. 154.

progressives currently are in first or second in the public opinion polls.[66]

The question of *which* progressive forces offering *which* program is, as mentioned previously, beyond the scope of this paper and will be the focus of the next part of this project. What does merit our attention at this stage is the tension between the nondemocratic practices that define the daily lives of most people in Latin America and the Caribbean and the periodic exercises of democratic procedures. Which brings us to the nature of the relationship between democracy and socialism in Latin America and the Caribbean.

Western conceptions of democracy, often referred to as "bourgeois" or "liberal" democracy, have traditionally focused on "respect for rights and the rule of law, freedom of speech, institutionalizing of electoral procedure and separation of powers, checks and balances, etc."[67] This is, broadly, the brand of democracy which has been associated with the current wave of democratization/redemocratization in Latin America and the Caribbean. This limitation to narrowly political democracy--principally indicated by/predicated upon the election of representatives through relatively free electoral procedures--is significant. Significant, yet flawed. The specific liberal democratic model that has been trumpeted in Latin America and the Caribbean has its roots in the U.S. and as such lacks a social dimension that would speak to the profound social ills that bedevil most of the people of the region.

There are clearly affinities among the various and assorted versions of "actually existing" or "real" democracy; broadly these "rules of the game" would appear to include universal suffrage, formal recognition of equal political rights, the regular election of representatives, and some notion of human rights. It is equally clearly that there is no democratic paradigm, no one model of democracy that is in place across either time or space. The notion of "liberal democracy" itself is relatively new and is contested.[68]

People in the U.S. have come to associate democratic practices and liberal economic policies--defined largely by free, or at least relatively free-markets--as profoundly and ineluctably related. As Lowenthal puts it, "for reasons of national experience and ideology, people in the United States like to think of these processes as not only compatible but as necessarily related--as

---

[66]In Chile the progressives have largely thrown in their lot with the Christian Democrats in the Coalition of Parties of Democracy (CPPS), the center-left coalition that has governed the country since the election. Chile's socialists clearly remain the country's second strongest party. See, e.g., "Chile: Unity Still Eludes Opposition," *Latin American Weekly Report*, WR-93-22 (10 June 1993), p. 254 or "Smaller Parties in Coalition Losing Ground," FBIS-LAT-93-055 (24 March 1993), p. 35. One poll found that Socialist Party leader Ricardo Lagos would win a first round election if he were the candidate of the CPPS. "Poll Shows PDC Frei as Favorite Presidential Candidate," FBIS-LAT-93-055 (24 March 1993), p. 35. Senator Riccardo Núñez, one of the leaders of Chile's Socialist Party has said that "socialism is not dead, but it is ever stronger in the conscience of the exploited and the humiliated and of those who, despite the obstacles, are striving for a better world." *Latin American Regional Report: Southern Cone Report* RS-91-10 (25 December 1991), p. 3.

[67]S. Amin, "The Issue of Democracy in the Contemporary Third World," *Socialism and Democracy*, no. 12 (1991), p. 95. Amin also notes that "Western democracy has no social dimension."

[68]As Gills and Rocamora note, "democracy is a contested term. Like so many terms employed in modern political discourse, its meaning varies with the context in which it is being used." They also astutely point out that while "everyone applauds democracy, those who in practice oppose it applaud most loudly." B. Gills and Joel Rocamora, "Low Intensity Democracy," *Third World Quarterly*, vol. 13, no. 3 (1992), p. 503.

two sides of the same coin, united by the element of free choice."[69] That is not necessarily intuitive.

In the 1820s when most of Latin America got its independence (much of the Caribbean would have to wait another 140 years) the terms liberalism and democracy represented ideals in conflict. While liberalism was driven by a focus on economic freedoms democracy was largely denoted by the search for equality. By the middle of the 19th century, however, liberalism and democracy had been joined, with liberals accepting the political concept of wide-spread suffrage and democrats conceding economic and social concerns to the liberals. Under the rubric "liberal democracy," democratic political practices are acceptable as long as they do not interfere in the economic freedoms which are conceived of as the driving force. The resulting paradox is of "peoples who vote and elect, and vote and elect again, yet never achieve any influence over substantive questions that would improve the conditions of their lives."[70]

There are variations within liberal democracy.[71] One of these is *limited liberal democracy*, where democratic practices and social benefits are largely limited to a society's wealthy and powerful except on those occasions when they extend the franchise to the general population; what is central is the protection and extension of capitalism. This is the type of liberal democracy historically encountered in Latin America.

Another variant is *procedural liberal democracy* which places a higher premium on the benefits of democratic procedures and therefore is more amenable to meeting the inevitable social needs of the majority, presuming that there is a way for them to affect policy, while maintaining a strong focus on the role of capital. The U.S. is probably a good example of this sort of liberal democracy. In both *limited liberal democracy* and *procedural liberal democracy* the term democracy connotes the defense of "liberty with the accent on economic freedom."[72]

A third variant, and the one most important for our later discussion, is *progressive liberal democracy* (or, more commonly, social democracy). In this form, democratic practices are construed beyond narrow political terms to the economic and social arenas as well and socialist or quasi-socialist management techniques are used to mitigate the economic realities of capitalism. This variety is most commonly identified with the modern social welfare states of Northern Europe. In this case, democracy denotes the defense "of liberty with emphasis on equality."[73] It also represents the nexus of democracy and socialism.

Despite efforts to instantiate *procedural liberal democracy* in the region, it would appear that representative democracy is not being successfully consolidated in most of Latin America and the Caribbean. Rather there seems to be, depending on the country, the introduction, continuation, or resurrection of *limited liberal democracy*. The result is the reinforcement of "what has been

---

[69]Lowenthal, p. 87.

[70]Osorio, "Liberalism, Democracy, and Socialism," p. 26.

[71]These are based on three suggested by Osorio, p. 26.

[72]Ibid., 25.

[73]Osorio, p. 25. Osorio opines that former U.S. President George Bush's support for "Latin America's advances in terms of economic freedom and democracy" are closer to the first two variants discussed here "while the democratic demands of 'Lula" in Brazil or the FMLN in El Salvador are identified more" with the third variant considered here.

called 'democracy by default,' 'delegative democracy' or 'low-intensity democracy.'[74] The institutions most commonly associated with democratic political procedures--political parties, legislatures, courts, and interest groups--find themselves frozen out.

The antifreeze may be *progressive liberal democracy*. The conditions extant in Latin America and the Caribbean today--huge disparities across the board between the wealthy few and the enormous number of poor who live in grinding poverty--makes the construction of meaningful *procedural liberal democracy* unlikely. Even if this could be achieved, such narrowly conceived notions of political democracy fail to speak to the realities of the region. This is where the link between *progressive liberal democracy's* commitment to a substantive social agenda and non-revolutionary socialism as it has evolved in Latin America and the Caribbean becomes critical.

In practice non-revolutionary socialism in Latin American and Caribbean has never been akin to the doctrinaire socialism of Eastern Europe or the former Soviet Union. It would be disingenuous to deny that "actually existing socialism" was a reference point, but the survival and growth of progressive forces in Latin America and the Caribbean "demonstrate that it is not, as has been widely assumed, dependent on foreign models and assistance."[75] Rather, the commitment of Latin American and Caribbean socialists has been to ending poverty and building social justice.

Internationally, Vilas points out, "socialism is the name that has been given, since the 19th century, to popular aspirations for a life of dignity, justice, and liberty."[76] In Latin America and the Caribbean, socialism has largely been denoted by the attention to the social concerns of the population and the redistribution of wealth. Efforts to gain power have been via the ballot box when such opportunities were available; open democratic electoral systems have been scrupulously respected by the region's progressives.[77] Latin American and Caribbean socialism, in this sense, may be best understood as an effort to provide the social component absent from both *limited liberal democracy* and *procedural liberal democracy*. Socialism and democracy thus have been profoundly linked in the region.

---

[74]Lowenthal, p. 82. On the topic of "low-intensity democracy"--a phrase obviously invoked to evoke U.S. counter-insurgency strategies--see Gills and Rocamora, "Low Intensity Democracy."

[75]S. Ellner, "Introduction: The Changing Status of the Latin American Left in the Recent Past," in B. Carr and S. Ellner, eds., *The Latin American Left: From the Fall of Allende to Perestroika* (Boulder: Westview Press, 1993), p. 19.

[76]Vilas, "Latin America," p. 82.

[77]Ironically, efforts to distort and/or destroy democracy have come in large part from the world's self-appointed guardian of democracy, the United States. The litany is a long and familiar one, ranging from low-level influence in the Costa Rican civil war in 1948 to far more direct economic and/or military intervention in Guatemala, the Dominican Republic, Chile, and Jamaica. This perspective is perhaps most neatly summed up in the response of Henry Kissinger, National Security Advisor to (and later Secretary of State for) U.S. President Richard Nixon, after the 1970 election of long-time Chilean Senate leader and three-time presidential candidate Salvador Allende: "I don't see why we need to stand by and watch a country go Communist due to the irresponsibility of its own people" (this remark is cited in a number of places, most recently M. McClintock, *Instruments of Terror: U.S. Guerrilla Warfare, Counter-Insurgency, Counter-Terrorism* (New York: Pantheon, 1992), p. 419). U.S. efforts to instigate a coup d'etat in Chile have been well documented, see, e.g., W. Blum, *The CIA: A Forgotten History, U.S. Global Interventions Since World War 2* (London: Zed, 1986), pp. 232-43; S. Hersh, *The Price of Power* (New York: Summit, 1983), pp. 258-96; and J. Prados, *President's Secret Wars* (New York: William Morrow and Company, Inc., 1986), pp. 315-22.

The important point is that in Latin America the commitment to opportunity and a vision of the future retains great appeal, especially when contrasted to the "liberation" offered by market economies. The obligation to end poverty, feed people, and improve health and educational opportunities remains inherent in the regional conception of socialism. It is this legacy which may enable the instantiation of *progressive liberal democracy* in Latin America and the Caribbean.

The potential for social democracy in Latin America and the Caribbean seems enormous. The region's progressive forces are the best hope for the immense majority of the population; in the other direction lies madness--a return to the repressive military dictatorships of the past. What is not clear is whether progressives in Latin America and the Caribbean can move beyond simply representing the next default position and forge a meaningful and functional alternative to neo-liberalism.

There are a wide range of reasons for this, not least of them the question (yet again) of *which* progressive forces offering *which* program. Regardless of the program, however, the most daunting issue is the array of structural forces to be confronted. The foreign debt, domestic economic crises, the lack of meaningful democratic institutions--the lack, for that matter, of a meaningful civil society--and the profound social catastrophe conspire to render most social democratic/progressive liberal democratic projects entirely problematic.

It is clear that neo-liberalism is failing; current governments find themselves talking less about how to manage the debt and more about managing the crisis of neo-liberalism. The progressive forces of Latin America and the Caribbean would seem to have a large audience waiting for them. The World Bank has argued that "raising all the poor in the continent to just above the poverty line would cost only 0.7 per cent of regional GDP--the approximate equivalent of a 2 per cent income tax on the wealthiest fifth of the population."[78] This helps explain why the socialist legacy in Chile remains a vibrant element of the effort to reconstruct democracy despite the best efforts of the Pinochet dictatorship to eradicate memories of the socialist's short time in office.

The Jamaican's reelection of Michael Manley, a Vice-President of the Socialist International, says a great deal about the continuing power and promise of the democratic socialist vision in the region. While Manley abandoned his high-profile if mild confrontations with the U.S.[79] and the International Monetary Fund, he remained committed to the gains made and maintained through almost a decade of opposition rule. According to Manley, "We sowed the seeds of social revolution....We altered class relations. Household helpers now enter by the front door, and poor Jamaicans have an unconscious reflex assumption about their rights. The poor used to say 'Do I have rights?' Now they know they do, and he who has rights forgets the time when he didn't have them."[80]

[78]1990 *World Development Report*

[79]The U.S. efforts to economically destabilize the government of Michael Manley in Jamaica are well documented, see, e.g., Blum, *The CIA*, pp. 299-304. Sklar, among others, has referred to 1980 election as an "electoral coup" staged with the help of the U.S. H. Sklar, *Washington's War on Nicaragua* (Boston: South End, 1988), pp. 390-1.

Whither Socialism in Latin America and the Caribbean:
The Utility of Radical Politics as an Analytical Lens

The question, finally, is whether progressive politics remains a fruitful reference point for social science investigations of socio-political change in Latin America and the Caribbean. This paper contends that it will. Several possible investigations would include exploring a case where socialists have been elected to office (such as Guyana), a case where socialists share power (such as Chile), or a case where progressives appear to be waiting in the wings (such as Brazil). The plethora of elections in Latin America and the Caribbean over the next 30 months offer a veritable smorgasbord of cases to be watched and considered. Another interesting case is the role of former revolutionaries, from Uruguay's former urban guerrillas, the Tupamaros, to the FSLN in Nicaragua, M-19 in Colombia, and the FMLN in El Salvador.

Progressive politics in Latin America and the Caribbean, as noted early on, is more powerfully positioned than ever before in its history. Historically progressive politics has represented the commitment to the creation of a just and equitable society in which wealth and power are not the prerequisites for food and justice. The immiseration of Latin America and the Caribbean proceeds apace; more neo-liberal policies and/or the return to the failures of the past seem cruel jokes. Whether the progressive forces of the region are able to step into the vacuum that confronts them remains to be seen. It hardly seems possible that they could do any worse.

INTELLECTUAL PROPERTY PROTECTION AND ANTITRUST:

CRISIS, COERCION, AND CHOICE

Susan K. Sell
Department of Political Science
George Washington University
Washington, D.C. 20052
e-mail: sellskgw@gwuvm.bitnet

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. I am grateful to Alasdair Bowie, James Lebovic, Sharon Lockwood, Henry Nau, and Lee Sigelman for extensive comments on earlier drafts.

In recent years the nations of the developing world have made a dramatic turn toward market-oriented policies. As recently as 1981, developing countries were pressing for a New International Economic Order (NIEO) based on economic nationalism and the rejection of global liberalism. Advocates of the NIEO called for a massive transfer of resources from North to South and preferential treatment for developing countries. In the 1970s and early 1980s, intense negotiations between industrialized and developing countries produced fundamental clashes over the appropriate role of the state in economic policy. Industrialized countries pressed for market-based policies, while developing countries sought global affirmation of a leading role for the state in economic policy. Yet today even the most ardent former champions of extensive state intervention in the economy and discrimination against foreign investors have adopted policies that emphasize private sector initiative, nondiscrimination, and economic openness. What accounts for this change in policy? That is the question addressed here, with specific reference to intellectual property protection and antitrust policy.

Since the mid-1980s developing countries have been adopting laws and policies for the protection of intellectual property based on a conception common to the industrialized world -

namely, intellectual property as private property. Intellectual property protection is important for both international investment and trade. Investors are reluctant to build plants or issue licenses in countries where their technology and know-how are not protected. Exporters of products or processes based on intellectual property seek to recover costs of developing the property and to prevent counterfeiting and piracy. In the past, many developing countries refused to issue patents to foreign inventors because patent protection provides a temporary monopoly and raises the prices of protected property. In other developing countries, protection was offered, but on a relatively limited basis. Indeed, during the NIEO era developing countries argued that intellectual property should be regarded as the "common heritage of mankind," and therefore freely available to all. More recently, developing countries have begun to adopt laws and policies to protect intellectual property. Because the effective protection of private property rights is a cornerstone of a liberal economic order, these new policies reflect the developing countries' shift toward a market economy.

Similarly, in the area of antitrust developing countries are beginning to adopt laws and policies that resemble those of the industrialized world. In the past, the few developing countries that had antitrust laws exclusively targeted local subsidiaries of foreign-based multinational corporations in the service of economic nationalism. Instead of using antitrust policies to promote domestic market competition, these countries had employed

them to control foreign enterprises' activities. More recently developing countries have come to perceive antitrust policies as relevant for their own domestic enterprises, and are designing these policies to break up domestic public monopolies that are a legacy of previous eras of economic nationalism. This is particularly apparent in the areas of trade liberalization and the privatization of public sector enterprises. The adoption of antitrust legislation and policies, and the creation of domestic institutions to monitor and enforce such policies will become increasingly important as these countries continue opening their markets and stimulating private sector activity.

To what extent are these policy changes the result of external pressure? To what extent are they the result of internal developments? In both issue areas, the economic crisis of the early 1980s prompted developing countries to adopt policies that promote their integration into the global economy.

Two schools of thought explain these changes in different ways: neorealism emphasizes the role of power; neoliberalism emphasizes the role of learning and institutions. Neorealist explanations based on hegemonic power and coercion can account for the substance and timing of the policy changes in intellectual property protection. In intellectual property protection, the U.S. has pursued a "get tough" policy with selected developing countries in its quest for immediate results. On the surface this appears to have been very successful. Neoliberal explanations based on voluntarism, learning and

international institutions are more compelling in the antitrust case. Institutional mechanisms for consultation and technical assistance, established in 1980 within the U.N. Conference on Trade and Development (UNCTAD) have played a central role in expediting the adoption of antitrust policies in developing countries. Since 1989 developing countries have been flocking to UNCTAD to learn more about the operation of antitrust policies, and have sought and received assistance in drafting laws and training antitrust officials. The antitrust case reveals a process that has been more gradual, circuitous, and more dependent on domestic circumstances within developing countries.

Comparing the intellectual property and antitrust cases sheds light on the relative efficacy of different ways to induce policy change in targeted states. These cases also demonstrate the relative explanatory power of neorealism and neoliberalism in accounting for different aspects of policy change - changes in perceptions of interests, the timing, substance, adoption, implementation, and enforcement of new policies. Finally, examining the adoption and implementation of these policies reveals different implications for the sustainability of these policies, and holds lessons for U.S. policymakers.

The first section of this paper provides a brief discussion of the NIEO negotiations in intellectual property protection and antitrust. The second section addresses the impact of economic shocks, and presents two alternative approaches to explaining the change. The third section traces the evolution in developing

countries' intellectual property and antitrust policies over the past decade.

NIEO NEGOTIATIONS

The NIEO negotiations of the mid-1970s through the early 1980s in intellectual property and antitrust were part of a broader effort of developing countries to assert greater control over their economic destinies. Dissatisfied with the postwar liberal economic order, they sought to reduce their dependence on the industrialized world. Argentina, Brazil, Mexico, the Andean Pact countries (Bolivia, Colombia, Ecuador, Peru and Venezuela), and India, which took the lead in the NIEO movement - had passed national and regional laws and adopted policies that reflected their view that the market-based economic order did not address their development needs.[1] In the early 1970s these countries institutionalized their dissatisfaction with the prevailing system and placed significant restrictions on foreign investment (especially from transnational corporations) and technology transfer. In each of these countries state agencies screened contracts and limited the share of foreign ownership and access to local capital, and trade barriers were used to protect fledgling domestic industries. All of these measures discriminated against foreign investors and strengthened national controls over economic development.

The leaders of the NIEO movement saw themselves as outsiders in the international economy, at a distinct disadvantage under

the prevailing international market bias. Instead of embracing the dominant norm of economic liberalism, they sought an international economic order based on economic nationalism that they hoped would sharply reduce global inequality. Their critique of liberalism, which emphasized the exploitation of developing countries, fostered unity in the struggle between the "haves" and "have-nots." According to Krasner, "it provided a subjective identity that welded the Third World into an effective political bloc. This subjective self-identity was a critical complement to the objective international and domestic weaknesses that provided the basic motivation for Third World demands."[2] The developing countries' dissatisfaction with the postwar economic order found its most forceful and coherent expression in the call for an NIEO and the Charter of Economic Rights and Duties of States, which were adopted by the United Nations General Assembly in 1974.

The 1970s witnessed a heightened emphasis on multilateralism, fueled by OPEC's successes in wielding commodity power in 1973 and again in 1979. The fear generated by these successes led industrialized countries to send negotiators to United Nations forums in Geneva to placate an angry South. This era of conference diplomacy created opportunities for the developing countries to press their demands and be taken seriously. The negotiations on intellectual property and antitrust reflect this emphasis on multilateralism. The Diplomatic Conference for the Revision of the Paris Convention

for the Protection of Industrial Property,[3] held under the auspices of the World Intellectual Property Organization (WIPO), began in 1980 and ended in March 1984. Negotiations on a Code of Conduct for the Control of Restrictive Business Practices (antitrust), hosted by the United Nations Conference on Trade and Development (UNCTAD), began in 1975 and ended in December 1980. Each set of negotiations will be discussed in turn.

THE INTELLECTUAL PROPERTY NEGOTIATIONS

The Paris Convention sets the international standard for the minimum acceptable levels of patent protection. Parties to the Paris Convention are free to pass national laws of their own design, provided that the minimum standards of protection are maintained. The Paris Convention embodies three main principles, which are consistent with economic liberalism. These are: 1) non-discrimination -- that there should be no barriers to entry of foreign patentees in a member state's national market; 2) national treatment -- that once a foreign patentee has entered a member state's national market, he or she should be treated no differently than nationals; and 3) the right of priority -- that the patentee should be protected from unauthorized use of his or her invention for a designated time period.

The leaders of the NIEO movement challenged these principles. According to an Indian patent expert, "... a patent not only provides a right for a person to use this knowledge but also excludes others from using it... This double-edged

provision has caused patents to be put to several abuses."[4] Developing countries argued that the patents they granted are overwhelmingly held by foreigners (usually transnational corporations); that patents become substitutes for foreign investment as a means of capturing developing countries' markets; that patents are often used by foreigners to acquire local enterprises; and that patents serve to restrict the flow of technology from North to South. In short, they argued that monopoly privileges bestowed by the patent system led to higher prices for imports and less favorable terms of trade for developing countries. As such, the patent system was seen as a mechanism by which the rich exploited the poor.

The Andean Pact countries, India, Mexico, Brazil, and Argentina had all institutionalized their dissatisfaction and had passed laws that violated the Convention's principles. For example, while the Paris Convention holds that a patent may confer an exclusive right of importation, the Andean Pact's law provided that "a patent may not confer an exclusive right to import the patented product or a product manufactured by the patented process."[5] All of these laws pledged to keep patent-free any technologies or products deemed vital to a nation's development, including such items as foodstuffs and pharmaceuticals. These laws further discriminated against foreigners by mandating the issuance of exclusive compulsory licenses to domestic producers in cases in which the patentees failed to commercially exploit their patents in the developing

country. In effect, exclusive compulsory licenses challenge the right of priority insofar as they effectively transfer the patent rights to local hands; "when an exclusive license is granted, the patent owner is excluded from using his own patented invention."[6] These activist countries sought to relax the Paris Convention's standards along the lines embodied in their own laws. They wanted the international system of patent protection to incorporate notions of public interest to balance the private interests given paramount importance in the Paris Convention's provisions.

The industrialized countries entered the Paris Convention negotiations determined to prohibit any weakening of the patent system. Because of this fundamental divergence in perspectives, the negotiations ended in deadlock, with no revisions, in March 1984. Thus the developing countries were ultimately unsuccessful in their efforts to weaken the patent system.

THE ANTITRUST NEGOTIATIONS

In December 1980, the UN General Assembly unanimously adopted the "Set of Multilaterally Agreed Equitable Principles and Rules for the Control of Restrictive Business Practices" (hereafter referred to as the Set). Unlike the Paris Convention efforts, the impetus for these negotiations came from the industrialized countries - particularly the U.S. However, the developing countries used the opportunity to press their NIEO demands in this forum as well.

Restrictive business practices (RBPs) are business practices deemed to be detrimental to economic competition and international trade. The guiding spirit behind the industrialized countries' approach to RBPs is belief in a liberal international economic order.[7] That order requires the lowering of tariffs, the elimination of non-tariff barriers to trade and investment, the recognition of reciprocity in transactions, national treatment, nondiscrimination, and the creation of rules that establish standards of fair international competition.

The NIEO program also incorporated developing countries' interest in controlling RBPs, but the spirit of their approach presented a marked contrast to liberal conceptions of antitrust. Specifically, developing countries' sought to: 1) gain greater access to Northern markets for their exports; 2) curb restrictive practices of transnational corporations; and 3) curb restrictive practices between parent corporations and their subsidiaries (intra-enterprise transactions). They sought the elimination of detrimental practices by transnational corporations in host countries and hoped to reorient the transnationals toward business practices that would have beneficial spillover effects on the local economies.

Developing countries' positions on restrictive practices reflected their perception that they had been exploited economically, and that "...any practice which has the effect of limiting their trade and development should be condemned as a restrictive practice."[8] Rejecting the concept of national

treatment, they sought on one hand to gain international approval for host country discrimination against transnational corporations, and on the other to gain approval for preferential treatment of local enterprises in developing countries. While many of these countries had RBP laws, they were aimed, in practice, at foreign corporations and the purpose of these laws was to increase host country control over the activities of such corporations.

When, in December 1980, the UN General Assembly adopted the Set of Principles and Rules it teemed with vague language and barely papered-over differences, and substantially embraced the industrialized world's conception of antitrust. While both sides declared victory, notions such as the redistribution of wealth or preferential treatment for developing countries were absent in the final formulation. In a joint letter dated November 9, 1981, the U.S. Departments of State and Justice announced to the American business community that the Set was consistent with U.S. antitrust laws and policies, U.S. trade policy, and "procompetitive, free market concepts."[9]

By contrast, as soon as the ink was dry on the final document the developing countries realized that their interpretation was not the prevailing one and they felt they had been duped into endorsing the Set. They soon discovered: 1) that the Set had no "teeth"; 2) that the developmental aspects of the Set would be ignored; and 3) that industrialized countries would

reject the link between restrictive business practices and international trade.

Under the terms of the Set, an Intergovernmental Group of Experts (IGE) is charged with implementing and interpreting the Set's provisions. States can formally complain to the IGE if they believe that another country's enterprise is engaging in restrictive business practices. Then the accused country is to submit a report about its enterprise's activities. However, the IGE has no power to pass judgement on enterprise activities; rather it is supposed to "... devote itself primarily to discussions of national and legislative enforcement experience, rather than attempt to turn the Principles and Rules into international law or transform UNCTAD into an antitrust enforcement agency."[10]

The Set also called for the implementation by UNCTAD of technical assistance, advisory, and training programs for developing countries. While emphasizing that the most important contribution to eliminating RBPs internationally would be the widespread adoption of national laws on RBPs in line with the Set, UNCTAD was to coordinate technical assistance programs, and the IGE was to provide a forum for discussion and consultation. What is striking is that developing countries did not begin utilizing this machinery until the late 1980s, nearly a decade after the adoption of the Set.

Developing countries had interpreted the Code as being consistent with their practices of targeting multinational

corporations, and protecting local enterprises and infant industries. They perceived that in the aftermath of the Set's adoption the industrialized countries deliberately ignored or downplayed the developmental aspects of the Set, for example by rejecting the Set's link to international trade. The industrialized countries, contending that they can control only what goes on "at home," interpreted the Set's provisions to refer only to domestic market competition. These divergent interpretations of the Set became apparent as recently as 1985 at the first conference to review the Set, which was characterized by acrimonious debate.

In an unforseen turnaround, however, beginning in the late 1980s, UNCTAD was suddenly inundated with developing country requests for technical assistance in designing, drafting, and implementing domestic antitrust legislation and policies. This constituted a marked change from the 1980-85 period, which was characterized by developing countries' suspicion and distrust about the merits of antitrust policies. What explains this policy change?

EXPLAINING POLICY CHANGE: CRISIS, COERCION AND CHOICE

The developing countries' quest to establish an NIEO in intellectual property protection and antitrust failed. Since the mid-1980s, developing countries have been abandoning economic nationalism in favor of market-based, liberal economic policies in both intellectual property protection and antitrust. To

understand this shift it is vital to take the economic crisis of the early 1980s into account. But that crisis provided a context for the policy shift, not a cause of it. In assessing the causes of the shift, we must consider two alternative explanations -- one based on coercion (neorealist analyses), the other based on choice (neoliberal analyses).

Power differentials between the industrialized and developing countries were heightened by the economic downturn that began in the late 1970s and progressively worsened in the 1980s, and the consensus that had been so crucial to the developing countries' multilateral agenda was shattered. Bank lending to developing countries dropped sharply, as did foreign investment. Between 1981 and 1986 inflows of foreign direct investment declined by nearly 25%.[11] In addition, many developing countries were saddled with huge foreign debts. The situation was exacerbated by a resurgence in protectionist trade policies and a drop in commodity prices. Developing countries were far more vulnerable to these economic shocks than were the industrialized countries. For example, Mexico went so far as to declare bankruptcy in 1982.

These economic shocks profoundly altered the behavior of developing countries -- but, as we shall see, with quite different effects on intellectual property protection and antitrust policy. To be sure, in both cases developing countries adopted policies that embraced economic liberalism. But what were the more proximate causes for these policy changes? And in

what ways did these proximate causes reflect the underlying causes? Why, for example, did they wait nearly a decade to use the institutional machinery established for antitrust to facilitate the adoption of new policies? By what mechanisms did these changes come about? What were the sources of these new policies? In short, the economic crisis of the early 1980s provides a backdrop for understanding policy change. Yet it is insufficient for understanding the precise timing of the changes, the sources of the substance of the new policies, and the mechanisms through which these changes came about. We need to look elsewhere to understand why the effects of the crisis played out as they did. According to Ikenberry and Kupchan, "At the domestic level, crisis creates an environment in which elites seek alternatives to existing norms that have been discredited by events and in which new norms offer opportunities for political gains and coalitional realignment."[12]

Where do these new norms come from? Both neorealism and neoliberal institutionalism offer hypotheses about the effects of crises. Neorealism emphasizes hegemony and coercion, whereas neoliberal institutionalism emphasizes learning and redefinitions of interest, sometimes facilitated by international institutions. In both accounts crises are seen as amplifying the effects of the focal variables.

A neorealist, power-based argument portrays crises as expanding the hegemon's opportunities to exercise coercive power. Furthermore, elites in secondary states who are looking for ways

to alleviate the crisis may be susceptible to the influence of a hegemon that is actively trying to promote its vision of the international order.

Examining the hegemon's ability to impose its will on secondary states brings us closer to proximate causes of policy change. Even a casual observer of current trends in developing countries must be struck by the extent to which their policies have come to resemble the wishes of the United States. Throughout the NIEO era the U.S. consistently argued that the road to development is paved by the free play of market forces, and repeatedly urged the developing world to adopt liberal economic policies. Thus, to the extent that developing countries are opening their markets, liberalizing trade and investment, adopting stronger policies to protect intellectual property rights, privatizing public sector enterprises, and embracing market mechanisms, they are "doing the right thing" from the vantage point of the U.S. The link between U.S. hegemony and the move toward the market by developing countries is the U.S.'s ability to manipulate material incentives to induce secondary states to comply with its wishes. The U.S. possesses considerable market power, and access to that market is critical for many developing countries. An obvious example of the U.S.'s efforts to wield its market power is its use of Section 301 of the Trade Act, which allows the U.S. threaten trade retaliation to induce policy changes in targeted states. Another example has been the U.S.'s linking of the Generalized System of Preferences

benefits for developing countries to the effective protection of intellectual property.

By contrast, neoliberal institutionalism offers an explanation based on learning and international institutions. Learning, of course, means altering beliefs or practices based on new information or experience.[13] It can occur as a result of the "demonstration effect" of observing others[14], deliberate influence or teaching by others[15], or consideration of one's own past responses in comparable circumstances[16].

Whereas neorealist analyses focus on hegemonic coercion, neoliberal analyses emphasize the role of international institutions in the socialization process. For example, Keohane argues that the existence of the postwar international economic regimes in the Bretton Woods system has facilitated the member states' shared commitment to economic liberalism and multilateralism.[17] These institutions have helped to spread norms and values that promote cooperation despite hegemonic decline. Ikenberry and Kupchan refer to this mechanism as "normative persuasion," which is based not on threats but rather on " transnational learning through various forms of direct contact via diplomatic channels, cultural exchanges, and foreign study."[18]

To summarize the distinction between these two types of explanations for policy changes in secondary states, the neorealist variant explains policy change as a result of duress and direct hegemonic pressure, whereas the neoliberal variant

explains policy change as a result of learning and the facilitating role played by international institutions. In the coercive hegemon scenario, the substance of new policies comes from external sources, but in the neoliberal scenario it is the result of choice. The source of the substance of new policies, whether coercion or choice, almost certainly has important implications for the sustainability of the liberal direction in developing countries.

INTELLECTUAL PROPERTY PROTECTION AND COERCIVE HEGEMONY

The most important development in the recent spread of intellectual property protection policies has been a change of strategy by the United States. The U.S. now can swiftly retaliate with trade sanctions in the event that targeted countries fail to adequately protect its intellectual property. The U.S. has consistently sought to strengthen intellectual property protection abroad. However, throughout the 1960s and 1970s its efforts at exhortation in various multilateral forums, including the World Intellectual Property Organization and UNCTAD, produced paltry results. Beginning in the early 1980s the U.S. began to pursue a more vigorous campaign to secure greater intellectual property protection abroad.

As early as 1982, the U.S. government engaged in numerous bilateral patent, trademark, and copyright consultations with countries such as Hungary, South Korea, Mexico, Singapore, and Taiwan. This bilateral approach was effective: Hungary,

Singapore, South Korea, and Taiwan took steps and enacted laws to ensure greater protection, and only Mexico resisted this bilateral pressure, issuing a pharmaceutical decree that expressed a disinclination to extend intellectual property protection in this area.

Through these early successes the U.S. government realized that exhortation alone was ineffective, but that linking trade and intellectual property protection could yield the desired results. As the former Assistant General Counsel to the Office of the U.S. Trade Representative (USTR) argued:

> When U.S. trade officials participated in bilateral consultations on intellectual property they talked to trade officials from other governments. In most developing countries, trade officials are high-ranking policy makers while intellectual property officials are administrators. Before laws can be changed in those countries, the policy must change and intellectual property administrators seldom change policy. Trade officials often can.[19]

In 1984 the U.S. Congress took the lead in fashioning a comprehensive approach to intellectual property. Two trade initiatives, the amendment of Section 301 of the Trade and Tariff Act of 1974 and the revision of the terms for the extension of the Generalized System of Preferences (GSP) for developing countries, strengthened the hand of U.S. delegations by explicitly linking intellectual property to trade sanctions.

Section 301 of the Trade Act of 1974 gives the President power to enforce U.S. rights under trade agreements or to eliminate policies and practices that discriminate or impose unjustifiable burdens on U.S. commerce. The Act also permits industries, trade associations, and individual companies to petition the United States Trade Representative (USTR) to investigate actions of foreign governments. If the USTR decides to investigate, the first step is consultation with the foreign government to try to resolve the problem. If these efforts fail, within a year (in all but subsidies cases, for which a shorter time period is mandated) the Trade Representative recommends appropriate action to the President. "Appropriate action" often consists of the threat of retaliation via trade sanctions.

Innovations in 1984 included an amendment that gives the USTR authority to initiate cases (thereby minimizing the prospect of foreign retaliation against industries that initiate investigations), and the explicit mention of failure to protect intellectual property as actionable. In 1988 the link between intellectual property and trade was further strengthened by the enactment of the Omnibus Trade and Competitiveness Act. The 1988 amendments effectively transferred authority from the President to the USTR to determine whether foreign practices are unfair and to take action, and also strengthened the intellectual property components that were originally incorporated in 1984.

The 1988 amendments indicated that the U.S. would continue to pursue the carrot-and-stick approach in trade policy and

fortified the connection between intellectual property protection and international trade. Section 301 had been greatly strengthened and the message was clear: retaliation would be swift.

In a second major initiative in intellectual property, the U.S. revised the conditions for granting benefits to developing countries under the Generalized System of Preferences (GSP). The GSP program waives tariffs on selected imported products from developing countries designated as beneficiaries. The GSP helps developing countries earn foreign exchange for debt servicing and for the purchase of U.S. exports.

The 1984 Trade and Tariff Act extended the GSP program until July 4, 1993, but added new conditions. Item 9 of the statement of purpose indicates that GSP " will encourage developing countries ... 'to provide effective means under which foreign nationals may secure, exercise, and enforce exclusive intellectual property rights.'"[20] Furthermore, the extension explicitly designates patents, trademarks, and copyrights as "property" that may not be expropriated, and requires that the President "give 'great weight' to intellectual property protection in making other decisions about the benefits a developing country receives under the program."[21]

The U.S. approach to intellectual property protection reflects the sentiments of U.S. businesses whose technology and intellectual property constitute valuable assets. As the Chairman of Standard Oil remarked:

> The misguided credo that intellectual property is the common heritage of mankind assaults the basic morality of good business. What I invented I own. I certainly don't mean this as a threat, but I am simply not going to license a process or build a plant in a country which turns around and steals my technology.[22]

As Ikenberry and Kupchan suggest, one way for hegemons to secure compliance with their wishes is to manipulate material incentives by inducements and threats. This strategy aptly characterizes U.S. efforts to secure greater protection for U.S.-generated intellectual property. By exerting pressure on developing countries via Section 301 of the Trade and Tariff Act, GSP benefits, and bilateral consultations with trade officials, the U.S. has linked the protection of intellectual property to continued market access. Has the U.S. been successful in its quest? Have developing countries responded to this pressure?

The short answer is "yes." In response to the economic crisis of the early 1980s, developing countries have increasingly tipped the balance away from import-substituting industrialization toward export-led strategies. The debt crisis, the perceived exhaustion of models of import-substituting industrialization, and the success of the East Asian countries have all contributed to this export-led shift. Therefore, access to northern markets has become more important. Table 1 demonstrates the sharp increase in the value of developing countries' exports in the past decade. By the mid-1980s the U.S.

market absorbed more than half of Latin American exports and one-third of exports from East Asia. This combination of factors gave the United States powerful leverage over these countries. In this context "large countries... often have considerable coercive power, because their economies represent a considerable percentage of the world market for many goods and services. If access to the U.S. market is restricted, the target nation cannot readily make up the losses by redirecting its exports."[23]

[Table 1 goes about here]

In a comprehensive analysis of the U.S. record in Section 301 actions, Sykes found that "Section 301 is fairly successful in inducing foreign governments to modify their practices when they are accused of violating U.S. legal rights; ... success is more likely with a GSP beneficiary."[24] Table 2 provides a summary of the Section 301 cases in which intellectual property issues were at stake. In all eight cases, the targeted governments agreed to improve intellectual property protection along the lines desired by the U.S. Furthermore, the timing of the changes demonstrates the strong link between this exercise of U.S. leverage and the changes in targeted states. In short, both the <u>substance</u> and the <u>timing</u> of these policies can be explained as a product of coercive hegemony. However, as the following cases demonstrate, from the standpoint of U.S. goals the issue of implementation is far more problematic. While developing countries have acquiesced in a formal sense by adopting new laws and policies, they have resisted implementing and enforcing these

policies. This discrepancy between policy adoption and implementation is consistent with neorealist explanations. It underscores the fact that developing countries are acting under duress, and are not "converts". Thereby it points to both the operation of hegemonic coercion and the limits of the coercive strategy.

[Table 2 goes about here]

A detailed examination of a number of Section 301 cases against developing countries follows, in order to illustrate the relationship between the substance and timing of policy change in targeted states, on the one hand, and the exercise of hegemonic coercion on the other. The Brazilian Informatics case resulted in the Brazilian government's pledge to improve copyright protection for computer software. In the 1985 Korean Intellectual Property Rights case the Korean government acquiesced in 1986 by enacting product patent protection for pharmaceuticals and improved enforcement procedures. According to the President of the U.S.-based Pharmaceuticals Manufacturing Association, "The Korean case was a major step forward and set an important example of what could be accomplished using trade instruments to achieve intellectual property objectives."[25]

The Korean case is listed as open because the private actors who have been monitoring Korean compliance - the International Intellectual Property Alliance and the Pharmaceutical Manufacturers Association - have been disappointed in Korea's performance. Pharmaceutical manufacturers Squibb and Bristol-

Meyers charged Korean companies with piracy and in 1989 filed new Section 301 complaints with USTR.[26] As a result, Korea has remained on the USTR's watchlists of intellectual property violators.

The U.S. Business Software Alliance (a Washington-based lobbying group formed in 1988 to represent U.S. software producers to battle piracy) and the International Intellectual Property Alliance have also closely monitored Korea's performance. In July 1992 the Business Software Alliance estimated that 86% of the personal computer software used in Korea was pirated, accounting for more than $300 million in losses.[27] Despite the passage of the Computer Program Protection Act (CPAA) in Korea in July 1987, penalties for piracy in Korea are still relatively low; the maximum fine for piracy is 3,000,000 Won (about $4,000).[28] The BSA continues to press for amendments to the CPAA to raise penalties against piracy, and the International Intellectual Property Alliance has recommended that Korea remain on the 301 watchlist.

The 1987 PMA-initiated case against Brazil for its lack of patent protection for pharmaceutical products is noteworthy because it is the only case that resulted in trade retaliation by the U.S. under the 301 provisions. After Brazil refused to alter its policy the U.S. placed a $39 million tariff on imports of Brazilian pharmaceuticals. Brazil filed a complaint with GATT about U.S. trade retaliation, but it "withdrew its complaint when the sanctions were dropped [in summer 1990] in exchange for

Brazil's patent commitments."[29] Former Brazilian President Collor proposed patent legislation that would protect pharmaceutical products and process patents for the first time. On February 21, 1991 Brazil formally revoked its Normative Acts covering patents, trademarks and technology and drastically reduced the interference of the Brazilian government in technology transfer transactions. The patent reform package presented to the Brazilian legislature " denies protection to drugs that are not made in Brazil, a provision intended to force patent holders to manufacture or license them locally."[30] Therefore the PMA will not be satisfied and will continue to monitor Brazil's approach. In the words of one TNC executive, "Brazil is looking for something to get it off the hook with the US Trade Representative. But I'm not really optimistic."[31] The PMA recommended that Brazil remain on the USTR watchlist in 1992. In the wake of the political scandals of the Collor administration, intellectual property protection has been put on hold by the Brazilian legislature.

In 1988 the PMA filed a petition against Argentina. In consultations between the U.S. and Argentine governments the U.S. secured a commitment from Argentina to strengthen patent protection for pharmaceuticals by 1992. The PMA subsequently agreed to withdraw its 301 petition. The Argentine Congress was considering various proposals for strengthened pharmaceutical protection which reflected the U.S. demands. However, consultations have continued and Argentina was included on the

1992 watchlist. In early 1993 Argentina was ranked as the top Latin American violator of pharmaceutical patents "due to a powerful group of firms dedicated to copying patents and selling pirated drugs throughout Latin America."[32] Reform proposals are likely to be watered down in Congress due to strong domestic opposition.

Similarly, Thailand agreed to improve its intellectual property protection in response to the 1990 301 filing over its lax copyright enforcement. Thailand has been repeatedly cited on USTR's priority watchlist, and in the 1991 patent protection case Thailand indicated that it would consider compliance and "is looking to the results of the GATT negotiations for possible guidance."[33] Therefore the case is still open. Intellectual property protection has placed Thai leaders in a difficult position. In 1987 Prime Minister Prem Tinsulanond's administration was ousted in a no-confidence motion after attempting to strengthen Thailand's copyright laws. Intellectual property protection is controversial in Thailand because piracy has become a lucrative business there. The domestic political stakes are obviously high so, "Bangkok's approach has been to compromise when necessary then fail to put the newly negotiated regulations in place."[34] Thai Commerce Minister Subin said, "...it wasn't possible for US officials to help draft Thai legislation, discreetly indicating it was a breach of sovereignty."[35] Washington has continued to pressure Thailand and has kept Thailand on its priority watchlist as an

intellectual property violator through 1992. While a strengthened law for the protection of pharmaceuticals was submitted in late 1991 to a special committee of Thailand's National Assembly, concerned parties in the U.S. expressed continuing pessimism because the "committee lacks a visible champion for greater patent protection."[36]

The 1991 Indian intellectual property case is still open. The U.S. decided to delay trade retaliation due to progress in U.S.-Indian negotiations over patent protection. "India has taken steps to meet foreign concerns about enforcement of intellectual property rights under existing laws."[37] Beginning in 1991 Prime Minister Rao implemented a liberal economic reform package substantially relaxing conditions for foreign investment. India softened its position against the inclusion of intellectual property rights on the GATT agenda. India has taken steps to strengthen protection for computer software, videos, and films, and has also improved its enforcement efforts. The Business Software Alliance has extended its activities to India and is keeping close tabs on developments there, particularly regarding enforcement. Despite India's moves in the desired U.S. direction, it has remained on USTR's watchlist.

The last 301 case listed in Table 2 covers intellectual property rights in the People's Republic of China. Initiated in 1991, this case has been the subject of intense negotiations. The PRC is not a GSP beneficiary, so that form of leverage is not available to the U.S. However, trade linkage has ultimately

proven effective in this case as well. The PRC enacted its first patent legislation in 1984, but this legislation was deemed inadequate by interested parties in the U.S. The 301 U.S.-Chinese consultations in August 1991 proved frustrating, but the PRC promised to resume discussions over copyright and patent protection in October of that same year. The value of the PRC's exports to the U.S. is an estimated $700 million[38], so the threat of trade sanctions is palpable. After repeatedly threatening the imposition of sanctions, the USTR formally withdrew its Special 301 investigation in January 1992. As a result of the negotiations, the PRC agreed to enact new laws and regulations to expand the scope of protection, and to join two international copyright conventions by the summer of 1993.[39] Undoubtedly progress on these issues will be closely monitored, but the U.S. succeeded in getting the commitments that it sought.

Another noteworthy case was the PMA's filing of a 301 petition against Chile for failure to protect pharmaceutical patents. The PMA withdrew its petition after consultations with the Chilean government, which promised to enact a pharmaceutical patent law by late 1989. Subsequently, several patent laws were proposed but the PMA rejected them as inadequate. After continued bilateral discussions, Chile's new patent law went into effect in September 1991, for the first time extending patent protection to pharmaceutical products. The law guarantees protection for 15 years; the U.S. had requested a 20-25 year

guarantee but agreed that Chile was moving in the right direction.

These Section 301 cases demonstrate that the U.S. strategy has been largely successful in securing compliance on paper. The timing and substance of the new policies can be explained by a neorealist approach that emphasizes coercion. Furthermore, in nearly every case the targeted countries have engaged in foot dragging and have resisted implementing and enforcing the new policies. This suggests that while these countries have changed their policies, they have not changed their minds about the merits of intellectual property protection.

In its quest to secure more extensive guarantees of intellectual property protection, the U.S. has also threatened a target country's status as a GSP beneficiary. The 1974 Trade and Tariff Act included intellectual property protection as a new criterion for extending and/or maintaining GSP benefits. In two instances, one involving Mexico and the other Thailand, GSP benefits were denied for failure to enact adequate patent protection. In 1987 Mexico continued its refusal to pass pharmaceutical product protection, and lost $500 million in GSP benefits.[40] The USTR cited Mexico again in 1989 under Section 301, but dropped Mexico from the list due to evidence that Mexico was considering major changes in intellectual property legislation in 1990. In 1989 the PMA filed a complaint against Thailand, and when Thailand failed to acquiesce it was denied its duty-free benefits under GSP in the amount of $165 million. In

both cases the targeted government faced strong domestic opposition to greater intellectual property protection from powerful local drug manufacturers, and was concerned that extending pharmaceutical product protection would lead to higher consumer prices. These cases illustrate that countries can choose to resist external pressure and may do so even at substantial cost to themselves. These cases suggest both the operation of hegemonic coercion as well as its limits.

An especially sharp reversal from past policies of economic nationalism is currently underway in Mexico. Many factors are at work, including: the Mexican decision to join the GATT in 1986; the change in leadership that brought President Salinas to power in December 1988; Mexico's placement on USTR's priority watchlist; and Mexico's eagerness to participate in the North American Free Trade Agreement. In January 1990 the Mexican government enacted new legislation for technology transfer, which superseded the economic nationalism provisions of the 1972 and 1982 laws. In a nutshell, the 1990 provisions "... eliminated the 'babysitting' spirit of the [previous] law[s] and previous regulations, offering a framework of juridical and technical security by allowing the parties to negotiate without the intervention and ultimate decision of the government."[41]

The Mexican government also issued a Program of Modernization of Industry and Foreign Trade 1990-1994 that explicitly stated its commitment to stronger intellectual property protection. The connection between the 301 pressure and

the Mexican response was clear, as the U.S. immediately took Mexico off the priority watchlist. On June 28, 1991 Mexico enacted a new industrial property law that represented a marked reversal of past policies. The new Mexican law for the first time extended patent protection to chemical, pharmaceutical, agrichemical, and biotechnology products. The law also included provisions for the protection of trade secrets (which had not previously been protected by Mexican law), stipulated that the importation of patented goods would constitute "working" the invention, and virtually eliminated the grounds for granting compulsory licenses.[42] According to the public affairs director for Pfizer Inc., a U.S.-based pharmaceutical enterprise, "The Mexicans gave us everything we wanted."[43]

Even the Andean Pact countries have gotten on the intellectual property protection bandwagon. All of the member nations, except Bolivia, have been placed on USTR watchlists for intellectual property protection violations. Under pressure from the USTR, industry representatives, and transnational enterprises, the Andean Pact countries in February 1992, approved Decision 313 which "... reverses the trade group's traditional hostility to tough intellectual property protection and provides a uniform legal framework with a range of rules related to licensing, patents and trademarks."[44] Venezuela was the first country to formally enact its provisions in August 1992, but Colombia, Ecuador, and Peru have all taken steps toward formal enactment. Colombia and Venezuela are still being closely

monitored by U.S. patent owners, especially those in the Pharmaceutical Manufacturer's Association. U.S. pressure on these countries continues.

In sum, the concept of hegemonic leverage goes a long way in accounting for both the substance and timing of changes in developing countries' intellectual property protection policies. Indeed, even though most analysts argue that neoliberal explanations are superior in accounting for the content of policies, in this case the neorealist analysis appears to be sufficient. The policies have been the result of direct pressure from industry representatives via the USTR, who have been instrumental in shaping the substance of the new policies through consultations with targeted governments. However, the continued monitoring and repeated threats of renewed 301 action in the absence of satisfactory enforcement of the new policies suggest that the trend toward greater protection of intellectual property is not being as ardently embraced as the U.S. would wish. The patterns of compliance and resistance are precisely what one might expect from coercive hegemony. The targeted states acquiesce on paper, and do just enough to get the U.S. off their backs but no more. At this stage in their development they do not see intellectual property protection as being in their interests. These cases suggest the importance of interests and capabilities, and support the neorealist perspective.

ANTITRUST AS A CHOICE: INTERNATIONAL INSTITUTIONS AND CHANGE

By contrast to the intellectual property protection case, the adoption of antitrust policies in developing countries has been based on choice rather than coercion. These policies have been adopted voluntarily, and the international institutional machinery established in 1980 under the RBP Set has played an increasingly important role since the late 1980s. As with intellectual property rights, the economic crisis of the early 1980s is critical to the understanding of the shift toward antitrust policies in developing countries. However, the effects of the crisis were different in this case; in the antitrust context, hegemonic coercion and threats from industrialized countries have been absent.

The switch toward export-led industrialization and attendant economic liberalization have raised a host of economic issues that did not seem salient to developing countries during the NIEO era. Deregulation, privatization, and the liberalization of trade and investment climates pose new challenges for developing countries. For example, by removing governmental regulations over economic sectors, states need to ensure that these regulations are not replaced by private sector anti-competitive behavior, such as market allocation or price fixing. As states privatize formerly state-owned enterprises, they need to ensure that private sector owners do not abuse their positions and replicate the inefficiencies of the former state sector. By breaking up former state monopolies, states seek to ensure that the new entities do not engage in restrictive business practices.

In addition, by liberalizing trade and investment climates, developing countries are abandoning their former stance of discriminating against foreign-based multinational corporations.

Thus, an economic logic is at work insofar as a country eventually gains an interest in promoting competition in its domestic market as a consequence of liberalization. Yet this is an insufficient explanation for developing countries' sudden intense interest in antitrust issues. For this, a dual focus on the role of international institutions as purveyors of ideas and on the element of choice or voluntarism is more illuminating.

Undeniably, certain coercive elements have been at work, for economic policy changes have been in part driven by structural adjustment programs through the IMF and the World Bank.[45] Economic liberalization is a core component of IMF conditions for loans to developing countries.

Even so, what distinguishes this case from that of intellectual property protection is that an international regime, established in 1980 through the adoption of the RBP Set, has played a significant role in spreading the industrialized countries' conceptions of antitrust and competition policy. The institutional mechanisms established under the terms of the Set provide a forum for education, the drafting of legislation, and the training of officials in implementation and enforcement of antitrust laws and policies. Policymakers in developing countries are recognizing the connections between liberalization and antitrust policies, and are taking the initiative and

actively requesting the help and advice of the Intergovernmental Group of Experts (IGE). In other words, even though the adoption of national competition legislation may be a component of reforms under IMF conditionality, particularly in the case of African countries, the more proximate explanation suggests a significant role for international institutions and choice. The voluntarism in this case represents a sharp contrast to the transparent coercive hegemony of the intellectual property case.

A decade after the adoption of the Set, the President of the Second Conference to Review the Set opened the Conference by noting that:

> The world was now quite different from what it had been 10 years ago when the Set of Principles and Rules had been adopted, or even 5 years ago when the first Review Conference had been held. The past year, in particular, had seen very rapid changes in the international economy and there was now a greater and more widespread appreciation of the benefits of the free market and competition.[46]

Indeed, the UNCTAD secretariat had received an unprecedented number of requests for technical assistance under the terms of the RBP Code from both developing and Central European countries beginning in 1989.

Many different types of assistance have been requested, including regional seminars or workshops, national seminars, drafting legislation, and training RBP officials. Table 3 lists the countries that have requested assistance and the nature of

the requested assistance. In addition to these countries listed in Table 3, Argentina, India, the Philippines, South Korea, and Venezuela have all adopted antitrust laws and have cited both the Set and assistance coordinated by UNCTAD as influential factors in the design of their laws. UNCTAD initially provided assistance in the form of regional workshops to introduce interested countries to the operation of antitrust and the control of restrictive business practices. Due to the huge demand in this area, it has expanded its activities to include national seminars, advisory missions, training workshops, and on-the-job training internships.[47]

[Table 3 goes about here]

The first country to adopt RBP laws after the UNCTAD negotiations was the Republic of Korea. A spokesman for the Korean government that his country "...responded immediately after the adoption of the Set by introducing the Act for Monopoly Regulation and Fair Trade and had started a systematic control of anti-competitive and unfair business conduct."[48] In drafting the Korean legislation, the government modelled its law after those of Japan and Germany yet has added uniquely Korean elements. For example, violators of the law have been required to issue public apologies. The staff of the Fair Trade Office judges this remedy to be, "... perhaps even more powerful than monetary remedies."[49]

Korea has targeted the chaebol, or <u>domestic</u> industrial conglomerates; in 1981 the 30 Korean chaebol comprised less than

1% of corporations, yet accounted for 39.7% of sales in mining and manufacturing.[50] Over time there has been increasing domestic consumer demand to restrain the power of the chaebol. Once viewed as engines of development, in the popular mind they are now perceived as corrupt and inefficient. With the recent democratization of Korea, public pressure against the chaebol has accelerated. According to Koo Suk-moo, vice president of the Korea Economic Research Institute, "The general public has linked business activities with personal wealth accumulation.... They now look at them [the chaebol] as entities of destructive power and influence."[51] In response to this negative assessment, in April 1993 the Chairman of the Fair Trade Commission, Han Lee-hun, announced that the new government of President Kim Young-sam "... will use anti-trust laws as its main weapon to curb the economic power of the chaebol.... Han explained that ... their dominance of the domestic economy prevented the growth of small and medium businesses."[52] Specifically, the Republic of Korea amended its Fair Trade Act in November 1992, "... to strengthen restrictions on cross-ownership and capital investment limits for large business groupings"[53]; this was the strongest legislative measure yet to curb chaebol power.

Another key difference between Korea's antitrust policies and intellectual property protection is that Korea is implementing and enforcing antitrust policies. Between 1981 and 1985, "in every case involving a major chaebol, violations of the statute were found, and the subsequent corrective orders indicate

that the chaebol were treated no less harshly than other defendants."[54] In this case there is no discrepancy between the adoption of the policies and their implementation; Korea's National Assembly both supports and approves of the activities of the Fair Trade Office.[55]

Looking back on Korea's decade-long experience in the RBP field, the Korean spokesman noted that:

> ... technical co-operation from international organizations such as UNCTAD and from developed countries had been very useful. During the past 10 years, the various international meetings on antitrust or RBP control, including the IGE meetings and seminars held by UNCTAD, had provided his country with good advice which had been instrumental in the efficient enforcement and improvement of fair trade policy in Korea.[56]

Thus, by contrast to the Korean efforts to strengthen intellectual property protection, the Korean implementation of antitrust policy has been influenced by UNCTAD activities, has been undertaken for domestic reasons, and has the support of the populace.

While Korea was the post-Set "pioneer" in a sense, a number of other developing countries have also adopted antitrust legislation and policies to control RBPs. In Latin America the Andean Pact countries had participated in UNCTAD regional seminars and each requested national level workshops. As the Colombian spokesman said:

> The liberalization of markets had revealed a series of imperfections that were incompatible with the general principle of competition. As economies were liberalized the Set of Principles and Rules had shown its usefulness, but at the same time its shortcomings had become apparent. In this context, the dismantling of quantitative restrictions in Colombia had led to the adoption of antidumping and countervailing duty statutes, and the beginning of revision of antimonopoly legislation.[57]

In 1989 the Andean Pact countries decided to renegotiate Decision 230 dealing with restrictive and unfair trade practices within the region in order to promote free competition to consolidate the Andean market. Both the Chilean and Ecuadorian spokespersons underscored that the Set had been an important, albeit insufficient, reference in redrafting Decision 230.

Peru and Venezuela have also adopted antitrust policies. Peru participated in regional and national seminars conducted by UNCTAD, and has requested further UNCTAD assistance in training antitrust officials to implement and enforce these policies. In November 1991 the legislature passed over 126 laws, many of them designed to stimulate private sector activity, and radically reoriented the country's formerly statist economic policies. As part of this sweeping change Peru eliminated state monopolies in telecommunications, postal and railway services and utilities.[58] Venezuela hosted the UNCTAD regional seminar in September 1990. Venezuela's new antimonopoly law established an Anti-Monopoly

Superintendency to implement its policies. A 1992 test case before the Superintendency suggested that the new law would be applied stringently. Venezuelan Sugar Distributor Co. (DVA) contracted with domestic sugar mills to be the exclusive distributor of sugar to the mills and asserted its right to set prices. Superintendent Ana Julia Jatar has challenged these contracts and, "... says the firm must negotiate contracts without exclusive clauses in order to open the way for competition. Observers say Jatar could be testing the water with 'small fry' before confronting the powerful cartels that have traditionally dominated Venezuela's distribution system."[59] It is noteworthy that the Venezuelan law is targeting domestic monopolies; this is a clear departure from the Andean countries' earlier antitrust approach of targeting transnational enterprises.

Chile began liberalizing its economy most recently in 1985.[60] After returning to democracy in March 1990 the Chilean government strengthened the institutions responsible for promoting and implementing liberalization and free competition. In 1990 Chile revised its former Anti-monopoly Law (Decree 211 of 1973) to expand the responsibilities of the National Economic Tribunal (Fiscalia Nacional), which has extensive investigative powers, to include the control of price distortions with respect to imports (Law 18.525).[61] Chile also participated in UNCTAD's regional RBP seminar in Caracas in September 1990, and discussed

its experience in the control of RBPs. The Chilean delegate to the Second Review Conference stated that:

> ... his country was keen on constantly improving its legislation with the objective of promoting free competition. It was also worth mentioning that a World Bank loan has enabled the Anti-monopoly Commission to computerize its data base. All these developments were fully in line with the Set of Principles and Rules. Moreover, Chile was willing to share its experience with other countries wishing to adopt and implement competition legislation.[62]

By organizing and conducting the seminars and meetings, UNCTAD has created a forum in which developing countries can compare notes with each other as they begin adopting and implementing these new policies.

India has fundamentally changed its treatment of foreign investors, and since 1989 has relaxed barriers to entry. The Monopolies and Restrictive Trade Practices Act (MRTP) of 1969 had been used to limit the entry of foreign multinationals into the Indian market. However, a senior executive of a large Indian enterprise (the Tata Group) pointed out that, "the way the law is being applied now 'has the effect of keeping the legislation in tact while dismantling, in practice, the entire edifice of regulatory controls built up in the 1970s.'"[63]

Relaxing the former stringent criteria for industrial licenses, the Indian government has approved numerous joint

ventures between Indian firms and foreign multinationals such as 3M and Honeywell. In late 1988 the government approved of a major collaboration between Tata Iron & Steel Co Ltd (TISCO) and U.S.-based Timken Co. to produce bearings. "The controversial project won government permits despite vocal opposition from existing manufacturers - on the very grounds that likely would have led to its rejection a few years ago."[64] Other Indian bearing manufacturers argued that the Tata-Timken venture would flood the market and hurt local producers. The government's Monopolies Commission rejected their arguments and defended the venture on the grounds that: 1) it would result in product upgrading due to access to superior technology; and 2) the venture would not seize the dominant market share, but would create a countervailing force[65] and stimulate domestic competition. Thus India is easing its discrimination against foreign multinationals, and at times is even defending the merits of foreign multinationals' investment against local opposition.

In 1987 Sri Lanka adopted legislation and linked the importance of these policies to its efforts at liberalization, privatization, and industrial promotion. A government spokesman expressed concern that in a newly open economic environment,

> ...market forces could lead to concentration of market power. There was a need therefore for a legal framework to ensure that market forces would not contrive their own destruction. These objectives were to be achieved through the creation of the Fair Trading Commission of Sri Lanka,

which applied the principles laid down in the Set of Principles and Rules.[66]

Sri Lanka also received assistance from UNCTAD in a regional seminar, and a program to train RBP officials.

Similarly, the Philippine government introduced Bill No. 996 in 1989 to address antitrust and RBP issues. This bill proposed to establish an independent Anti-Trust Commission and various features of the bill were inspired by the RBP Code, U.S. laws and court decisions, and European models or experience. Speaking on behalf of the Group of 77 (developing countries), the Philippine delegate emphasized that "In the 10 years since the adoption of the Set, the functions of the Intergovernmental Group of Experts had assumed greater importance as Governments made competition policy a priority."[67] In November 1992 at the IGE meeting, the spokesman for the Philippine government indicated that UNCTAD had provided generous technical support for the development and institutionalization of Philippine competition policies.[68]

Many African countries, such as Ghana, Kenya, Nigeria, and Zambia, have also actively sought UNCTAD assistance in designing policies to control restrictive business practices. For example, Ghana availed itself of UNCTAD's services by: participating in a national seminar in February 1991; hosting an UNCTAD consultant and UNCTAD RBP staff member for a working visit for advice in drafting legislation; meeting with UNCTAD RBP experts in London in May 1992 and visiting London's Office of Fair Trading; and

returning to Geneva to discuss Ghana's RBP program with the RBP Unit of UNCTAD.[69]

In the African cases the structural adjustment policies of the IMF and World Bank have played an important role in promoting market-based economic policies. However, the Kenyan antitrust law recently came under severe criticism from the U.S. Agency for International Development (AID) as being far too sophisticated for such an underdeveloped market. And in March 1993 Kenya reversed its economic reforms; Kenyan President Daniel Moi announced that, "as a sovereign state, Kenya will no longer accept any form of economic arm-twisting from any quarter".[70]

The institutional mechanisms established in 1980 have come to serve a number of important functions. Multilateral assistance in the form of UNCTAD's regional seminars has introduced large groups of government officials to basic RBP control principles. The IGE has become a forum for informal consultations that "... served in the past to identify problems that developing countries ... faced in RBP control, had provided a forum for discussions of possible solutions to such problems and had served to establish important contacts between experts of developed and developing countries."[71] UNCTAD also has compiled and distributed a list of RBP control authorities in numerous countries, complete with phone numbers, addresses and fax numbers, and a standardized checklist for information requests and for steps that countries take in preparing a case and requesting consultation.[72] In this sense it is reducing

transaction costs for interested states, and thereby providing important benefits to participants.

Beyond reducing transaction costs, the IGE has become a source of detailed, substantive information about the rationale for and operation of the control of RBPs. During each session of the IGE, states are encouraged to engage in multilateral and bilateral consultations on RBPs, address specific problems, and establish contacts with experts. Participants have praised these consultations as helpful and informative, and in response to the IGE's request the UNCTAD secretariat has pledged to continue to provide facilities for these consultations. UNCTAD has encouraged States to present seminars on specific substantive topics at these meetings. For example:

> ... member countries of the OECD have suggested the following two topics for multilateral consultations: (a) "Deregulatory issues, including the appropriate regulation of natural monopolies"; (b) "The rights of defendants in competition investigations and proceedings." The United States has volunteered to make a presentation on the first topic and France on the second. Other States are invited to make presentations on these or other subjects they may wish to discuss during the session.[73]

This is precisely the type of exchange that the industrialized countries had originally envisioned for the IGE in 1980.

By contrast to the acrimonious First Conference to Review the Set in 1985, the Second Conference in 1990 was characterized

by a high degree of consensus on the merits of both the Set and the activities of UNCTAD in this area. At UNCTAD VIII, which took place in Cartagena in February 1992, member States agreed that:

> UNCTAD should pursue, through the Intergovernmental Group of Experts on Restrictive Business Practices, its work with regard to policies and rules for the control of restrictive business practices to encourage competition, to promote the proper functioning of markets and efficient resource allocation, and to bring about further liberalization of international trade.[74]

The NIEO focus on economic exploitation is absent from this formulation. As the spokesman for the industrialized countries noted, "... an increasing number of developing and eastern European countries were following the Set's principles in developing their own RBP legislation.... The Set ... had stood the test of time better than could have been imagined in 1980."[75]

The case of developing countries' antitrust policies is best explained by the neoliberal concepts of learning, voluntarism, and the role of international institutions. Clearly the RBP regime established in 1980 has played an important role in providing information, facilitating transnational learning, and getting developing countries on the RBP control bandwagon. In Ikenberry and Kupchan's terms, this is a case of "normative persuasion" in which the participating countries have learned

more about and accepted the idea of RBP control prior to adopting policies.[76] By actively approaching UNCTAD for help in the design of these policies and for consultations to improve their functioning, developing countries have been volunteers rather than coerced targets of hegemonic manipulation.

Developing countries have redefined their interests and this regime has made a difference. The institutional mechanisms provided by UNCTAD have expedited the adoption of new antitrust policies. Furthermore, UNCTAD has provided an arena in which developing countries can choose from an array of approaches to RBPs, design and adopt RBP control policies for their own reasons, learn from each other as well as from industrialized countries' experts, and do so in such a way that does not compromise domestic legitimacy.

CONCLUSION

Comparison of intellectual property protection and antitrust policies in the developing world provides numerous insights into the process of economic liberalization currently underway in developing countries. While the economic crisis of the early 1980s was a critical factor in the shift away from the NIEO program toward export-led, market-oriented policies, the process of economic reform has been quite different in intellectual property and antitrust. In the intellectual property protection case the exogenous shock of economic crisis amplified the effects of hegemonic coercion; this is consistent with a neorealist

explanation based on the power of the hegemon. By contrast, the economic crisis helped to resuscitate the moribund RBP regime a decade after its establishment, consistent with the neoliberal emphasis on choice, learning, and international institutions as purveyors of norms.

In the intellectual property protection case, a neorealist explanation based on coercive hegemony acounts for the substance of the new policies, and the timing of their adoption. The lack of implementation and enforcement also highlights the fact that these policies were adopted under duress. The targeted states have succumbed to the direct pressure of the hegemon, but have yet to embrace the norm of intellectual property protection. In the antitrust case, a neoliberal explanation based on learning, voluntarism, and the role of international institutions accounts for the substance, adoption, implementation and enforcement of the new policies. In practice, the implementation and enforcement of these policies reveals a redefinition of interests; the new policies are being directed at <u>domestic</u> enterprises, and in the case of India, reverse the NIEO hostility toward multinational corporations. The fact that there is no discrepancy between adoption and implementation in the antitrust case suggests that developing countries have redefined their interests and embraced the idea of antitrust.

The specific cases examined here demonstrate two different ways in which hegemonic norms come to be adopted in targeted states. In both cases developing countries have come to adopt

policies that the hegemon has long desired. The case of intellectual property protection demonstrates the mechanism of hegemonic coercion via manipulation of material incentives and use of threats. The case of control of restrictive business practices and antitrust policies illustrates the mechanisms of learning, voluntarism, and international institutions. Even though both types of policy change embrace a market orientation and integration into the global economy, the different mechanisms by which they have been adopted matter and suggest different prospects for the sustainability of these new policies.

In intellectual property protection the U.S. strategy was successful insofar as developing countries adopted new policies that reflected the hegemon's norms and value orientations. This case is an example of what Ikenberry and Kupchan refer to as socialization through external inducement, or, "'acts before beliefs'. The causal chain is as follows: external inducement ---- policy change (cooperation through coercion) ---- norm change (cooperation through legitimate domination)."[77]

The process of normative change is still underway, and is therefore still reversible. The distance between adopting policies on paper and believing in their intrinsic merits is significant. The fact that developing countries have not vigorously enforced these new policies suggests that domestic opposition is still robust. Interested private parties in the U.S., such as the Pharmaceutical Manufacturers Association, the International Alliance for Intellectual Property, the Business

Software Alliance, and the Semiconductor Industry Association, know that there is a great distance between formal policies and actual commitment to the value of heightened standards of protection and their enforcement. Thus they are continuing to monitor the implementation of these policies and to threaten 301 action.

To an important degree the depth and sustainability of these recent policy reforms in intellectual property protection will depend on the emergence of politically influential indigenous interests committed to this direction. In any significant policy shift there are bound to be winners and losers. The U.S.'s 301 strategy has helped to mobilize developing countries' domestic opposition, particularly among local pharmaceutical manufacturers and others who profit from piracy. It has also put elites in developing countries in a difficult position. If they buckle under U.S. pressure, they are subject to criticisms of selling out their sovereignty to foreign interests; this has been particularly acute in Thailand but has arisen in other countries as well.

The new policies' legitimacy has been challenged, and 301 is becoming a powerful symbol of foreign interference in domestic affairs. This coercive strategy might well backfire. In extreme cases, such as in Thailand, caving in to foreign pressure could upset the delicate balance that keeps reformers in power, and lead to a nationalist backlash and the ouster of market reformers.

By contrast, the prognosis for the control of RBPs appears to be more positive. Developing countries are moving in the same market-led direction by adopting these policies. They are moving more slowly than is the case with intellectual property protection, but they are tailoring these policies to fit their particular situations with the help of UNCTAD. They are also voluntarily making use of the resources provided by the RBP regime. These policies will be more politically palatable and will be perceived as more legitimate because they cannot be construed as the result of buckling under crude foreign pressure. In this case persuasion has helped these countries re-evaluate where their material interests lie.

Based on the contrasts between the two cases, it would seem that the U.S. might be better off by concentrating on education and persuasion in intellectual property protection. As more developing countries' domestic industries suffer from a lack of adequate intellectual property protection and as their high value-added export products that incorporate intellectual property come to be pirated, these industries will support stronger enforcement. For example, Taiwanese computer exports have already been pirated in Southeast Asia, England, and the PRC, and Taiwanese toy manufacturers have also been the victims of piracy. Large, well-established export industries in Taiwan have lobbied for policy changes to curb piracy and counterfeiting of Taiwanese goods.[78] Video and record producers in Brazil, Mexico, Korea, the Philippines, and Singapore, computer

associations in Thailand and Malaysia, and some drug manufacturers in India have all demonstrated an interest in stronger standards of intellectual property protection.

The U.S. should pursue links with indigenous developing countries' industries that would benefit from stronger intellectual property protection. These policies will be effectively implemented only when these countries embrace them for their own reasons, and by backing off on the 301 approach the U.S. will not be creating untenable political situations abroad.

Finally, by adopting a more constructive approach and pointing out how developing countries' material interests would be better served by vigorous enforcement the U.S. can reduce the costs of maintaining the economic order. If the U.S. can be patient it will not need to use coercion. 301 is a cumbersome diplomatic tool; it is time- and energy-consuming and it generates ill will in targeted states. Getting more developing countries on the intellectual property protection bandwagon will help the U.S. in its quest to secure a multilateral instrument through the GATT. If the U.S. succeeds in this quest, it will not need to pursue the 301 route to guarantee intellectual property protection. Forging transnational links between private parties will become increasingly important as a way to marshal lasting support for maintaining an open international economic order.

3. "Industrial property" was the term used for patents and industrial designs in the late 19th century. In recent years the term "intellectual property" is more widely used in the context of the issues discussed here. Intellectual property encompasses patents, know-how, trade secrets, trademarks and copyrights. The Paris Convention deliberations revolved around patents. Copyrights are covered in the Berne Convention. Both are administered by the World Intellectual Property Organization.

Abstract

American Election News in Comparative Perspective

Holli A. Semetko

This paper describes an ongoing cross-national study of the role and influence of the media in national election campaigns involving several countries -- Germany in 1990, the U.S. and Britain in 1992, and Spain in 1993 -- and presents key findings based on data from the first three. Television news, one of the most credible sources of information at election time, is the focus of the paper.

This paper has two general aims. One is show how television news covered the U.S. 1992 presidential campaign and determine whether this has changed in important ways since the early 1980s. Comparisons over time are based on identical content analyses of the 1984 and 1992 campaigns. This study also shows how campaigning on television in the 1990s compares across three Western democracies. In each of these countries, main evening flagship news programs were content analyzed, using comparable codebooks and variables. Television news producers and editors were also interviewed and newsroom observation studies were conducted during the campaigns in each country at "NBC Nightly News" in New York, ITN's "News at Ten" in Britain, ZDF's "heute" in Germany.

How important are election campaigns in TV news? What opportunities does TV news afford politicians to communicate to citizens? How do reporters influence news content? Are reporters' comments about the candidates exceedingly critical or unusually obsequious? How much attention is given to the real issues and problems facing the country in comparison with the spectacle of campaign events and the 'horse race'?

The over time comparisons of U.S. election news suggest that 1992 represented a retreat from a preoccupation with opinion poll reporting, which was down significantly from the previous decade despite the added excitement of a competitive three-way race. The substantive issues were given considerably more attention in the bulletins. TV reporters in 1992 nevertheless exercised

considerable discretion over the news agenda by initiating the main topics of stories, by including numerous non-party actors such as voters, experts and the journalists themselves in most stories, and by often offering evaluative comments about the candidates.

In a cross-national comparative context, however, despite the increased emphasis on the substantive issues in 1992, the U.S. is at the low end of the continuum on issue coverage. Germany was at the high end, given the unprecedented problems surrounding unification and developments in the East. Britain was also much closer to Germany than the U.S. with respect to the amount of issue coverage. U.S. news continued to be more preoccupied with the events of the campaign and the personal qualities of the candidates than TV news in other countries. Germany was at the low end of the continuum with respect to campaign coverage, with Britain closer to the U.S. at the high end.

On the relative power of politicians and the media to initiate TV news, Germany was most open to politicians' inputs and reporters rarely initiated news stories. In the U.S., by contrast, the media initiated considerably more news than the candidates or parties, and British news appeared more like the U.S. in this respect. The high visibility of politicians in election news in Britain, however, runs counter to this and suggests that British news, like German news, was in fact far more open than U.S. news to featuring politicians in stories. German and British reporters were also much more likely to simply describe the activities of politicians in a neutral fashion, rather than offer an evaluation (reinforcing or deflating the message of the politicians), whereas U.S. reporters' comments were more often evaluative.

U.S. reporters are thus unusual in the extent to which they shape the television news agenda. This is evident in the comparatively high proportion of evaluative comments made about candidates, the comparatively low visibility of candidates and parties versus non-party actors, and the comparatively high

proportion of media initiated news stories. The fact that Britain's commercial program (ITV) often appears more like U.S. news than its BBC public service competitor, is probably reflective of the more competitive television marketplace that has developed in that country over the past decade. BBC and ITN news in the 1983 general election, in many respects, was more similar than different (Semetko et al. 1991).

German TV news is unusual in the comparatively little attention paid to the campaign, the advantage given to the incumbent parties of government in terms of their ability to initiate the news as well as their visibility as actors in news stories, and the remarkable lack of directional commentary by reporters about politicians. Unlike Britain where the television programs are virtually saturated with campaign news, the German 1990 national election campaign, during its "hot phase," was only occasionally visible in the TV news media.

Previous studies have identified a number of system-level factors which may influence the content of campaign news on television. Based on newsroom observation in each national setting during the campaigns several additional factors which may influence the content of election news are identified here: news values and how they are applied the selection of stories; television journalists perceptions of their roles; the mission of the news program; and the perception of the campaign as important and significant, and deserving of coverage in the program.

American Election News in Comparative Perspective

In the expanding field of political communication research, until fairly recently, comparative studies have been noticeably absent even in the form of single country case studies. 1 The existing literature on comparative electoral behavior has been accomplished largely through secondary analysis of surveys that have been independently conducted, with little or no attention paid to campaign communication. 2 Yet, as Kaase (1987) argues, even individual voting behavior can only be explained with an understanding of the "institutional, organizational and local contexts" in which citizens are imbedded.

Comparative analysis provides an opportunity to "escape from ethnocentrism" so common to most research (Dogan and Pelassy 1984). It permits us to learn whether theories developed in one national context hold in other national contexts (Przeworski and Tune 1970). Without variation in institutional contexts, it is simply not possible to establish how the particular configuration of media and political institutions in one country influences the information environment and, potentially, public opinion. Comparative analysis allows us to examine how those involved in the political communication process -- citizens, political parties, and the media -- behave when operating under different institutional constraints and to elaborate the consequences of this for democratic politics.

This paper presents some key findings from a cross-national study of the role and influence of the media in national election campaigns involving several countries -- Germany in 1990, the U.S. and Britain in 1992 and Spain in 1993. The project builds and expands upon an earlier cross-national comparative study of media content and the news production process in previous U.S. and British elections (Semetko et al 1991). It will draw on three comparable sources of data collected during the national election campaigns in each country: interviews with and observation of television journalists and editors at work in TV newsrooms; analysis of media content during the campaign; and

national surveys to ascertain possible media effects on public opinion about the parties, leaders and issues, as well as vote choice. 3 Both the press and television were important vehicles for information in each of these election campaigns. Television news, one of the most credible sources of information at election time, is the focus of this paper. Since the data from each country are at various stages of analysis, results from the newsroom observation and media content analyses in the U.S., Britain and Germany are presented here.

The Cross-National Comparative Project on Media and Elections

Political scientists have traditionally thought about election campaigns in terms of short-term and long-term influences on the vote. In recent years, short-term factors have come to play a greater role in electoral choice as the pool of potential floating voters has increased in most Western democracies (Dalton 1988). There has been a general trend toward greater issue voting in the past twenty years and in almost every country this has been accompanied by a decline in the influence of social class, religion and other social characteristics on vote choice (Baker, Dalton and Hidebrandt 1980; Miller et al 1991).

In parallel with these developments, mass media have come to play an increasing role in election campaigns, both as a primary battleground for politicians and as a primary source of information for electors. Broadcast and print media are nowadays the predominant sources of election campaign information for citizens in virtually all Western democracies. As a source of campaign information, mass media are also more important than direct contact via canvassing, attendance at political rallies, or political discussions.

Private television channels have come into existence only fairly recently in Germany and Spain. As a result, the audience ratings for the public broadcasting channels which once held a monopoly have declined markedly. The 1990 German national

election and the 1993 Spanish national election were the first campaigns fought under the circumstances of this new media environment, in which broadcast news audiences had access to multiple information sources and were broadly dispersed among public and private channels. Politicians had a larger number of outlets at which to aim their campaign activities than ever before and electors had a wider range of choice in obtaining information about the campaigns. In Britain, the main evening news programs on the BBC, the public service channel, and on ITN, on the commercial ITV channel, continue to be the flagship programs, and in 1992 a new satellite commercial channel, SKY News, also covered the campaign (Semetko forthcoming).

The project addresses two general questions. The first concerns the relative influence of politicians and the media in the shaping of the campaign agenda. Although agenda-setting studies have been among the most prominent and significant contributions to political communication research over the past decade, the literature has generally failed to question and examine the presumed discretionary power of the media in the agenda-setting process (Shaw and McCombs 1977; Weaver et al. 1981; Iyengar and Kinder 1987). In this study, the concept of agenda-setting is extended to include the contributions of potentially powerful news sources. The central question here is: How is the campaign agenda formed and what are the relative contributions of the media and the candidates/parties to this process?

The second question addressed by this project concerns the impact of campaign news coverage on electors: What influence does campaign media coverage have on citizens' attitudes and responses to the campaign? More than a decade of research on mass media effects in the U.S., Britain and Germany suggests that, under certain circumstances, media use is related to recognition and recall of candidates, gains in knowledge about party policies and issues, and increases in issue salience (Blumler and Semetko 1987; Schoenbach 1987; Kaase 1986; Noelle-Neumann and Mathes 1987; Graber 1989). Election coverage also

has been found to influence turnout and voting behavior, under certain circumstances (cf. Norpoth and Baker 1980; Baker and Norpoth 1981; Blumler 1983; Neuman 1986). The public's reliance on a wider range of broadcast news sources suggests a potentially greater role for the media than in previous campaigns.

Two points regarding the bases for cross-national comparisons deserve mention here, before turning to the factors which may influence the content of election news. One is the length of the campaign in each country and another concerns the media compared here.

The length of the election campaigns varies from country to country and for purposes of comparison, the "official" campaign period is used. In the U.S., this runs from Labour Day in early September to Election Day in early November. The British campaign is shorter, running from three-and-a-half to four weeks, between the time Parliament is dissolved and the election is held. In Germany, the two months prior to Election Day constitute what has been called the "hot phase" of the campaign, when political advertising is aired and politicians are actively campaigning for re-election. In Spain, the "official" campaign runs approximately two weeks prior to Election Day and in 1993 this was from May 20 to June 8, during which time the parties' ads are aired on television and news is closely monitored by the political parties. But the parties began campaigning in mid-April, when Parliament was dissolved and elections were called.

In each country, the national main evening news programs are a central source of information for electors during the campaigns and are the focus of politicians' daily campaigning activities. Although a number of other political magazine programs are offered in Germany and Britain during election time, and far more than in the U.S., the viewership of the main evening news is the most widespread and the politicians in each country attach the greatest importance to it for reaching electors during the campaign.

Influences on Television News Coverage of Election Campaigns

There were significant differences between Britain and the U.S. in the coverage of election campaigns in the early 1980s and in the extent to which politicians were able to influence that coverage (Semetko et al 1991). The similarities and differences in the campaign information environments in these two countries were explained by a number of system-level factors, among which were differences in the media systems. The public service broadcasting system in Britain and the commercial system in the U.S. had important consequences for the content of campaign news. A country's media system was also identified as a key variable in shaping the campaign information environment in a earlier studies comparing legislative races in a cross-national context (Blumler and Semetko 1987; Schoenbach 1987). Another recent study comparing how broadcasting systems are financed also shows that this has important consequences for both the range and quality of news and information programming (Blumler and Nossiter 1991).

Over the course of the 1980s, there were a number of changes in the broadcasting systems in these countries which may have an important influence on the amount and substance of election news on television. One common trend in all three countries has been a move toward more channels and more competitive broadcasting systems (Becker and Schoenbach, 1989; Blumler and Nossiter, 1991). The public service broadcasting channels in Germany - ARD and ZDF - were the predominant sources of news for most viewers until the mid-1980s when two private channels - RTL+ and SAT1 - became available. Audiences are now distributed across all four channels (and two more recent ones - Pro7 and Tele5), although the two public service channels remain the most prestigious. In Spain, the news on Antena 3 has recently become the main commercial competitor to the news on the two public service channels TVE-1 and TVE-2, but there is also now news available on two other commercial channels -- Tele 5 and Canal Plus -- which are attracting increasing audiences. In Britain, the BBC and the commercial Independent Television News (ITN), its

main competitor since the 1950s, now face increasing competition from new companies, as the broadcasting system has become more fragmented and competitive. In the 1992 general election campaign, although BBC and ITN continued to be the news programs most watched, they faced competition from Channel 4 News as well as SKY News. In the U.S., the three main networks -- ABC, CBS, and NBC -- also face increasing competition from local cable markets as well as a CNN, which came into prominence in the 1980s and is now described as the "fourth network."

The degree of competition in the broadcasting systems, and the extent to which the public service channels occupy a predominant position, may thus have important consequences for the contribution of election news to the campaign information environment in these countries. If a public service broadcasting organization continues to occupy a predominant position in the television news market, then the competing commercial channels may be inclined to use the public service channel's news program as a model on which to base decisions about their own offerings. In Germany, for example, the private channels originally aimed to provide something quite different from the public service channels' news programs and opted for the up-beat style more common to U.S. news programs (Mathes and Semetko, 1991). Now, however, they have more or less returned to the "serious" tone of the public service channels. In Britain in 1992, ITN's advertising constraints meant that there was much less time to provide the detailed kind of election coverage found on the extended BBC bulletin and new story formats were devised with the aim of providing the most important information in an interesting fashion. These included analysis pieces by leading political correspondents in London as well as live coverage from the campaign trail with reporters travelling with the party leaders around the country. ITN and BBC nevertheless paid close attention to one another's program content.

Another potentially important influence on the content of election news is the degree to which the broadcasting organizations are autonomous from political control or influence.

Public service broadcasting organizations may be less autonomous than commercial organizations, and this may also have consequences for the content of election news. In Germany the political parties play a significant role in overseeing the public service television channels, and there is a premium placed on partisan sympathies in the promotion and hiring of television journalists. This may have very important consequences for what emerges in the bulletin as news about the campaign. In contrast to Britain and the U.S. where reporters describe themselves as politically neutral, German television reporters rely on "leftist" and "rightist" terminology to describe themselves and one another. Balance in the newsroom is viewed in terms of the numbers of "red" (SPD) or "black" (CDU) newspeople. In Spain, the popular assumption is that the news on the public service channels (TVE-1 and TVE-2) is pro-Government, or pro-Socialist, while the news on the main commercial competitor (Antena 3) is more pro-Conservative (or opposition), and this will be the first of this assumption with content analysis. Nevertheless, Spanish television news reporters for the most part refuse to claim allegiance to any political party.

A third, related, factor concerns the traditions or rules governing election news and election broadcasting generally. These range, on the one hand, from the rules about the availability of political advertising on television, to the traditions governing campaign coverage in the news bulletins. In Britain, where political advertising time may not be purchased but is instead made available to the parties free of charge, these two go hand-in-hand: the broadcasting organizations have used the ratio by which party election broadcasts (PEBs) are allocated as a guideline for measuring balance in election campaign news coverage (Semetko, 1991). So, for example, in 1992 when the Conservatives and Labour each received five PEBs and the Liberal-Democrats received four, the main news programs aimed at a ratio of 5:5:4 in the coverage of the political parties during the campaign. Both BBC and ITN kept a running tally of the amount of time the parties were seen in the bulletins during the

campaign, although ITN claimed to have moved away from letting "stopwatching" govern the selection of news in each program. Britain is exceptional in this respect. In Germany, balance in election coverage is assumed to be attained over the range of programs, and broadcasters do not necessarily strive for balance within a single program. In the U.S., as in Spain, there is little in the way of guidelines concerning balance in election news, other than an obligation to provide impartial coverage of political affairs generally. In past U.S. elections, at least, the amount of coverage of the political parties and the candidates has tended to be balanced (Semetko et al., 1991).

In comparing influences on the television news agenda, it is also important to note another trend common in all four countries: politicians' sophisticated campaigning styles. Politicians in all countries aim to stage events for the cameras during election time. The increasingly sophisticated campaigning styles may encourage television news reporters to respond to what they perceive to be staged events. This was already apparent in the U.S. and Britain in the early 1980s, where, though then still somewhat rare, "disdaining" comments were made by reporters covering the political leaders on the campaign trail to alert viewers to the manipulative efforts behind the parties' and candidates' activities (Semetko et al, 1991). In the 1990s, this perspective might be already woven into the fabric of election news coverage. British reporters in fact described this has having already been the case in the coverage of the 1987 campaign.

Network News Coverage of the 1992 U.S. Presidential Campaign

NBC news was content analyzed from September 1 to November 2, 1992. 4 Every story in each broadcast was included in the study, though stories which did not mention any U.S. politicians were only coded for their main subject, length and placement in the program. There were 548 stories on NBC network news during

this period. Of these, 219 or 40 percent, mentioned U.S. politicians while 60 percent concerned other non-political domestic news such as crime or sports, or foreign news. Of the stories mentioning U.S. politicians, 82 percent (N=179) also mentioned the presidential campaign. Taking all news (N=548) on NBC during this period then, the campaign was mentioned in 33 percent of stories. Four variables -- story topic, the initiation of story topic, the visibility of political actors, and reporters' evaluations of political actors -- are discussed here with regard to stories mentioning U.S. politicians. Non-political and foreign news is excluded.

What were the topics of political coverage during this period? Up to six topics were coded for each story, in order of predominance. As Table 1 shows, of the stories mentioning U.S. politicians, the top five main topics were: the candidates, the campaign, the economy, social policy, and the programs or records of the parties/candidates. As the first and third columns in Table 1 indicate, the rank order of topics is almost identical, whether one takes the number of stories as the base or the number of topics. The second column in Table 1 is an indication of the visibility of topics in stories, and shows that the campaign was a topic in 70 percent of stories, the candidates in 68 percent, the economy in 36 percent, social policy in 30 percent, and parties/candidates' programs/records in 22 percent. The campaign and the candidates thus surfaced as a topic in more than two-thirds of domestic political stories during this period, and the economy and social welfare issues in about one-third.

Table 1 about here

Looking at column one, substantive issues -- the economy, social policy, defense, education etc. -- were the main topics of one-third of news stories. Stories which had the campaign as their main topic included 10 percent about campaign strategy, tactics and organization; 10 percent on the presidential debates,

their analysis, voters' reactions, and the debate over the debate format; and only 5 percent on opinion polls. Stories which had the candidates as their main topic included 8 percent on the candidates activities on the campaign trial, 2 percent on the media treatment of the candidates, and 12 percent on normative character themes such as the draft issue for Clinton, Perot's judgment, and Bush on Iran-Contra.

A comparison with coverage of previous elections would probably reveal that news about the substantive issues was not only more apparent in 1992 but also ranked higher on the media agenda. In this respect, NBC's agenda initially seems more issue-oriented than the networks' agendas in the 1972 and 1976 presidential election campaigns reported by Patterson and McClure (1976) and Patterson (1980), the 1980 campaign reported by Robinson and Sheehan (1984), as well as the 1984 and 1988 campaigns (cf. Semetko et al. 1991). News about the horse race, despite the added uncertainty and excitement provided by the dark horse Ross Perot, did not dominate campaign coverage in 1992. One reason for this may be the networks' reactions to the 1988 campaign. Interviews with editors, producers and reporters at NBC Nightly News in New York over one week in October 1992 revealed that as a consequence of a post-election internal debriefing as well as the public criticism of the news coverage of 1988, NBC made a special effort to move away from what they described as the 'tarmac TV news' of that campaign, a reference to reporters' eagerness to cover every landing and take-off on the campaign trail at the expense of the substantive issues. 5 Lisa Meyers, who NBC assigned to Ross Perot during the campaign, in fact never left Washington to interview Perot or cover any of his limited campaign appearances during the two month period.

The degree to which candidates were successful in initiating the subjects of news stories was assessed. Story topics were classified as either candidate/party initiated, media initiated, or other initiated, others included non-party actors. Candidate/Party initiated topics were those stemming from politicians' planned public statements or activities. This

included, for example, speeches or statements made by candidates and party leaders at rallies and on the campaign trail. Media initiated topics were those which stemmed from reporters' activities, such as questions to politicians during press conferences or on the campaign trail. They were also present in investigative reports, poll reports, and stories taking elements from different time periods.

In 1992, story topics were far more often initiated by the media than the candidates. Taking the main topic of the story, the media initiated 63 percent and the three candidates/parties 29 percent, while others initiated 8 percent. Taking all topics in a story, the figures are nearly identical -- 64 percent media and 29 percent candidate initiated.

How visible were the candidates and other actors in political coverage? Up to four actors were coded for each story. Actors included all politicians as well as government officials, and other non-partisan or non-political actors. Table 2 shows that there was a slight incumbency advantage for George Bush, who appeared as the main actor in 13 percent of stories compared with 8 percent for Clinton. Because stories sometimes concerned both candidates equally, it is useful compare columns two and three and these continue to show that Bush was more visible than Clinton.

Table 2 about here

But the most remarkable finding in Table 2 is the extent to which non-partisan or non-political actors dominated the coverage of domestic politics during this period. A full two-thirds of stories had non-political actors as the main actor in the story, such as representatives of interest groups, state and local officials, voters, and journalists as experts. Journalists accounted for the majority of these non-political actors. This may have been unusually high on NBC because of the regularity of stories featuring the three reporters covering the candidates -- Andrea Mitchell, John Cocoran, and Lisa Meyers -- in a 'cross-

talk' format, in which they commented as 'experts' on the events of the day. Nevertheless, the amount of news devoted to non-political actors reactions to the campaign was substantial. This may be an indicator of the network's efforts to move away from having the candidates' travel activities set the agenda, though in 1984 it was already apparent that U.S. politicians, in comparison with their British counterparts at least, have less opportunity to influence the news agenda and get their messages across in their own words (Semetko et al. 1991).

How did reporters evaluate politicians? Stories including the activities of the top candidates were analyzed for reporters' comments, and up to five comments were coded for each story. A comment consisted of the reporter's statement, preceding or following 'soundbites' or actualities from politicians. Most stories contained fewer than five comments. This variable takes account of the voice-over only. What, then, did reporters themselves add to the coverage of the candidates? Did they 'reinforce' the message of the candidate, did they 'deflate' it, did they offer 'mixed' comments (ie. both reinforcing and deflating) or were their comments predominantly 'straight/neutral/descriptive'?

Eighty-four percent of stories mentioning politicians were analyzed for reporters' comments, and this amounts to 33 percent of all NBC news coverage when non-political domestic and foreign news is included (N=548). Table 3 shows that of the 186 stories containing reporters' comments, 'straight' or neutral remarks were the most common, followed by 'deflating' comments, 'reinforcing' comments, and 'mixed' comments. When offering directional remarks, reporters were thus more apt to criticize or 'deflate' the message of the candidate than 'reinforce' it.

Table 3 about here

Table 3 also shows how these remarks were distributed across the candidates. This reveals that although George Bush held an advantage in terms of visibility in the news, this was not one in

terms of the tone of the stories. Bush was by far more often the target of 'deflating' comments than the other candidates, whereas Clinton was most often the target of 'reinforcing' comments. The 'deflating' comments on the Bush/Quayle campaign were not solely pertaining to the economy. One-quarter were in campaign stories, 25 percent were in candidate stories (where Iran-Contra was a character issue), and 21 percent were in stories about the economy.

This preliminary look at the network coverage of the 1992 presidential campaign was intended to provide some of the most interesting details from a campaign that was unusual in many respects. Opinion poll coverage, on NBC at least, was down substantially from what it had been in 1984 when it had ranked third on NBC's agenda (following campaign news, and candidate news). In 1984 it amounted to nearly 16 percent of all topics in NBC news, compared with 4 percent of all topics in 1992. In 1984, the total number of topics on NBC (N=587) was also comparable to 1992 (N=581) (Semetko et al. 1991:139). In 1992, in fact, opinion polls surfaced as one among many topics in no more than 11 percent of stories. This is despite the fact that 1992 was a heated and competitive race, as well as a three-horse race, whereas during the Fall of 1984 Walter Mondale never came within ten percentage points of Ronald Reagan in the published polls.

The visibility of the candidates in comparison with non-political actors such as experts, business and union representatives, or other media, has also apparently shifted since 1984 quite dramatically toward the latter. Whereas in 1984 these non-political actors accounted for approximately 21 percent of actors in comparison with the presidential and vice-presidential candidates who accounted for about 52 percent, with the rest as other main party actors, in 1992 the figures were 60 percent non-political versus 26 percent for the candidates (cf. Semetko et al. 1991:127). Broadcasters in 1992 therefore appear to have moved well away from the 'tarmac', instead inclined to

take or 'make' the news from people on the street as well the 'experts' among them.

The initiation of story topics is another indicator of broadcasters enhanced agenda-setting role. Taking all networks in 1984, 41 percent of stories were initiated by the two candidates/parties, and 59 percent by the media (Semetko et al. 1991:125). This compares with approximately 29 percent and 63 percent respectively in 1992, with 8 percent initiated by others. Over the past decade TV news reporters have come to exercise even greater discretion in reporting the campaign and now play an even more substantial role in shaping the news agenda. These preliminary comparisons over time are for the most part reliable since the 1992 study used many of the identical variables as in 1984.

Is American coverage of elections -- in terms of the subject matter, the initiation of topics, visibility of political actors and reporters' evaluations of politicians -- the norm in other democracies? Was U.S. network news remarkable for the visibility it gave to the 1992 campaign or does the U.S. campaign appear less predominant when compared with that in other countries? Only a comparative approach can address these questions.

TV News in a Comparative Context

Two recent elections are used as the basis for comparison with U.S. network news -- Germany's 1990 December national election to the Bundestag which was preceded by a two month campaign, and Britain's 1992 April parliamentary election which was preceded by a one month campaign. Main evening network news on Germany's four Western channels (ARD, ZDF, RTLplus and SAT1) and on Britain's flagship main evening channels (BBC1 and ITV) were content analyzed using comparable codebooks and variables, by local teams of trained coders under the supervision of the author. 6 All stories mentioning politicians in each country are the basis for the comparisons.

Table 4 presents the main topic of stories mentioning politicians during the recent election campaigns in these countries. The campaign (including coverage of the candidates activities and personal qualities) was most important in the U.S. and least important in Germany, where it accounted for only 15 percent of stories. It is worth noting that most (10 of the 15 percent) of the German news concerned the Landtag (state level parliamentary) elections which took place in the new Eastern states as well as Bavaria and Berlin on October 14th. News about the campaign for the Bundestag was far less visible, and news about the parties' platforms or records almost non-existent. In Britain, there was substantially more coverage of the campaign and party leaders on the commercial program which, in this respect, appeared more like U.S. network news in its emphasis on the campaign trail than traditional British broadcasting. In addition, ITN gave substantially more space to coverage of the opinion polls than the BBC.

Table 4 about here

The substantive issues -- the economy, social welfare, and a number of related and country-specific issues -- on the other hand, were most important in Germany and least important, though not insubstantial, in the U.S. The issues and problems facing the country accounted for approximately 70 percent of stories in Germany, 40 percent in the U.S., and between 66 percent (BBC) and 49 percent (ITN) in Britain. Although U.S. network news was more concerned with the substantive issues than in had been in previous elections, its emphasis on what Patterson (1980) called the 'electoral game' nevertheless remains high when considered in a cross-national context.

What opportunities did the political parties have to initiate the topics of news stories? Table 5 presents the initiators of the main topic of news stories mentioning politicians in each country. Media initiation is highest in the U.S. (63 percent of stories) and lowest in Germany (16 percent),

with Britain much closer to the U.S. side of the continuum (50 percent on the BBC and 58 percent on ITN were media initiated). Reporters in the U.S. and Britain exert far more influence over the news agenda than their German counterparts. Germany is also unusual in the lack of balance in the initiation of news between the main contenders for power. The incumbent parties (CDU/CSU FDP) initiated substantially more stories than the opposition (SPD, Green, PDS). The Government and non-party sources also initiated more news in Germany than in either of the other countries.

Table 5 about here

If not successful at initiating the news, then how visible were the candidates and party spokespersons in the news in each country? Three findings in Table 6 are most notable. One is that in most cases, the incumbent held a slight visibility advantage over the main opposition candidate, though in Germany this the was the most extreme. The Chancellor featured as the main actor in six times as many stories as the SPD leader. Secondly, once we move away from the top candidates to consider lower-level party spokespersons, this visibility advantage was greatly diminished and sometimes non-existent except in Germany, where CDU/CSU or FDP party spokespersons appeared as the main actor in substantially more stories than the Opposition. Finally, U.S. news was unique in the emphasis placed upon other (non-party) actors, and this is largely a reflection of the fact that many stories featured voters or reporters themselves as experts or commentators. In comparison with their counterparts in other countries, U.S. politicians were the least visible despite the fact that the U.S. carried the most news about the campaign.

Table 6 about here

Finally, visibility is no longer an advantage if it results in negative news. How did reporters comment upon or evaluate the

activities of politicians? Up to five comments were coded in each story. Table 7 reveals that Germany ranked highest and the U.S. lowest on a continuum ranging from straight/neutral to directional: 96 percent of reporters' comments were straight or descriptive in Germany compared with 47 percent in the U.S. When reporters offered directional evaluations of politicians, they were slightly more likely to be 'deflating' than 'reinforcing' in the U.S., whereas the reverse was true for Britain.

Table 7 about here

Discussion

The over time comparisons of U.S. election news suggest that, on NBC at least, 1992 represented a retreat from a preoccupation with opinion poll reporting, which was down significantly from the previous decade despite the added excitement in 1992 of a competitive three-way race. The substantive issues were given considerably more attention in the bulletins. TV reporters in 1992 nevertheless exercised considerable discretion over the news agenda by initiating the main topics of stories, by including numerous non-party actors such as voters, experts and the journalists themselves in most stories, and by often offering evaluative comments about the candidates.

In a cross-national comparative context, however, despite the increased emphasis on the substantive issues in 1992, the U.S. is at the low end of the continuum on issue coverage. Germany was at the high end, given the unprecedented problems surrounding unification and developments in the East. Britain was also much closer to Germany than the U.S. with respect to the amount of issue coverage. U.S. news continued to be more preoccupied with the events of the campaign and the personal qualities of the candidates than TV news in other countries. Germany was at the low end of the continuum with respect to campaign coverage, with Britain closer to the U.S. at the high end.

On the relative power of politicians and the media to initiate TV news, Germany was most open to politicians' inputs and reporters rarely initiated news stories. In the U.S., by contrast, the media initiated considerably more news than the candidates or parties, and British news appeared more like the U.S. in this respect. The high visiblility of politicians in election news in Britain, however, runs counter to this and suggests that British news, like German news, was in fact far more open than U.S. news to featuring politicians in stories. German and British reporters were also much more likely to simply describe the activities of politicians in a neutral fashion, rather than offer an evaluation (reinforcing or deflating the message of the politicians), whereas U.S. reporters' comments were more often evaluative.

U.S. reporters are thus unusual in the extent to which they shape the television news agenda. This is evident in the comparatively high proportion of evaluative comments made about candidates, the comparatively low visibility of candidates and parties versus non-party actors such as voters, experts, or journalists themselves, and the comparatively high proportion of media initiated news stories. The fact that Britain's commercial program (ITV) often appears more like U.S. news than its BBC public service competitor, is probably reflective of the more competitive television marketplace that has developed in that country over the past decade. BBC and ITN news in the 1983 general election, in many respects, was more similar than different (Semetko et al. 1991).

German TV news is unusual in the comparatively little attention paid to the campaign, the advantage given to the incumbent parties of government in terms of their ability to initiate the news as well as their visibility as actors in news stories, and the remarkable lack of directional commentary by reporters about politicians. Unlike Britain where the television programs are virtually saturated with campaign news, the German 1990 national election campaign, during its "hot phase," was only occasionally visible in the TV news media.

Although the political parties regularly held rallies and the chancellor candidates were often campaigning in towns and cities, these activities were rarely reported in Germany's main evening television news programs. This general lack of emphasis on the campaign in the main evening news bulletins appears to be at least in part a consequence of editorial decisions, with newscasters assuming that stories merely about campaign events are not "hard news" and do not deserve coverage in the main evening news program. Those involved producing ZDF's main evening news program "heute," for example, who were interviewed as part of this study, believed the program should cover the issues of the campaign when they were "newsworthy", but the program should not serve as the transmitter of staged campaign events or "party propaganda". Cameras were rarely sent to the campaign rallies held by the chancellor candidates because nothing "new" was likely to emerge from the set speeches.

The German television news producer's response to the politicians' campaigning activities is thus unlike that of the British or the U.S. television news producer. ITN and the BBC, for example, in 1992 as in previous elections, sent camera crews and reporters along with the party leaders every day and to all the party rallies. Film from these events was broadcast almost every day of the campaign. And U.S. network news is very concerned with having colorful visuals which are often provided by the politicians' rallies and speeches on the campaign trail. Camera crews are sent with the candidates and are at all the campaign rallies. The German television news producer, however, is less preoccupied with having colorful visuals and more concerned with the substance of the story.

German television news about the campaign is thus quite different from the U.S. or Britain (cf. Mathes and Semetko 1991). Although incumbents in the U.S. and Britain also have the advantage of being seen "governing" during election campaigns, an effort is made by the news media to depict the incumbent or the incumbent party as a contender for power during the final stages of an election campaign, and most news about the President or

Prime Minister is often matched by a similar amount of coverage of the opposition parties or candidates. In Germany, however, this was not the case in 1990 -- a major hindrance to the opposition party's ability to communicate to voters via TV news. Whereas in the U.S. and Britain, campaign events provide an important opportunity for generating coverage in the news media, in Germany these are largely not covered by television news programs. They are also ignored by many of the current affairs programs which often take the form of panel discussions or issue-specific investigative reports.

Earlier a number of possible influences on the coverage of election campaigns in television news were discussed. Based on the study of the German 1990 campaign, in addition to those mentioned at the outset of this paper might be added four:

- news values and how they are applied the selection of stories,
- television journalists perceptions of their roles,
- the mission of the news program, and
- the perception of the campaign as important and significant, and deserving of coverage in the program.

With respect to the first of these, it is interesting to note that in German television news visuals do not appear to be as important a factor in the selection of a story for inclusion in the bulletin, in comparison with Britain and the U.S. Many German news stories are told by the anchor alone with a backdrop graphic in a blue box. In the U.S. and Britain, by contrast, if colorful visuals are not available the story may not be included in the program. News values in Germany, then, place greater importance on the substance of the story than on the content of the visuals.

With respect to the second point above, German television newspeople are not afraid to say that they are setting the agenda, but setting the agenda takes on different forms in comparison with Britain and the U.S. (Semetko, 1991b). In

Germany, it appears to involve preventing news from being aired rather than taking up and reporting on politicians' activities on the campaign trail or initiating stories about the issues or the horserace. To take one example, during the first observation day, the CDU launched its manifesto at a press conference. This merited only a 22 second anchor-in-studio item with no footage from the press conference. The item came very late in the bulletin. One editor's explanation was that the press conference contained "nothing new" and "therefore we thought about not including anything at all, but we decided to include something finally". In Britain, by contrast, reporters are more reluctant to claim an agenda-setting role though they are very interested in initiating news about the issues and the party platforms (Blumler et al. 1989). When the parties launched their manifestoes in 1992, both BBC and ITN contained lengthy pieces on party policy, including graphics as well as film from the party press conferences.

With respect to the third point, ZDF's concept of "Heute" as a hard news program designed to provide a concise summary of the most important events of the day, also restricts the amount of campaign news in the bulletin. There are a number of other political discussion programs on offer during prime time, dealing specifically with the election and fronting politicians in a discussion format. Moreover, the later program, "Heute Journal", much like BBC's "Newsnight," contains longer more analytical pieces concerning the campaign. Nevertheless, the largest audiences are those for the main evening television news programs. Audiences for political discussion programs and "Heute Journal" tend to be those who are already strongly interested in politics and the campaign.

Moreover, the campaign itself is not something the German news organization accounts for in budgetary terms. There is no separate budget for covering the events of the election campaign. Instead, it is covered as any other news story. One consequence of this is that cameras are not sent to all the political

rallies, so the material may not even be available from the pool of items for possible inclusion in the program.

Finally, in Germany, election campaigns are viewed as something manipulative, and are generally looked down upon by electors and newspeople. Adopting a paternalistic stance, television newspeople aim to sort out the truly newsworthy ("something new") from the "same old thing" (attacks, or reiterations of party policy), and many times decide not to bring any news of the campaign into the program. To protect viewers from the manipulative efforts of politicians then, the news more often than not contains no coverage of the campaign rather than critical coverage of the campaign. One could also argue, however, that this is also a consequence of the extent of political control in the public service broadcasting advisory councils and concern about possible criticism or negative repercussions from airing a critical story.

German television newspeople exert an important influence over the campaign agenda as presented on television news but the result of this is simply very little campaign news in the bulletins. German politicians, therefore, and particularly the opposition parties, are at a greater disadvantage in attempting to reach publics via television news during election campaigns than their U.S. or British counterparts. Whereas in Britain the campaign story is almost always aired with neutral voice-over comments by reporters, and in the U.S. the story is aired with pretty pictures often accompanied by evaluative voice-over commentary, in Germany the campaign story rarely even makes it into the bulletin.

Notes

1 Paletz's (1987) volume on Political Communication Research is an early notable exception that includes single-country case studies, as well two other volumes currently in progress (Beck, Gunther and Mughan, forthcoming; Kaid and Holz-Bacha,

forthcoming). Patterson and Donsbach's (1993) project on "Media and Democracy" is a genuinely cross-national comparative study of journalists in a number of democracies launched in the late 1980s.

2 There are two recent exceptions. Semetko, Blumler, Gurevitch and Weaver's (1991) work on party and media influences on media agendas in U.S. and British election campaigns one cross-national comparative study. Beck, Dalton and Huckfeldt's (1993) and Semetko and Roberts' (1993) work on the media and the 1992 U.S. presidential campaign is also part of a larger cross-national comparative project on the intermediation process in recent national elections, involving national teams of election researchers in Germany (1990), Britain (1992), the U.S. (1992), Spain (1993) and Japan (1993). Beck, Dalton and Huckfeldt received National Science Foundation support for their U.S. election study. In addition, the recent proposal by Steve Rosenstone, Donald Kinder and Warren Miller to the NSF entitled "Long-Term Support for the National Election Studies, 1994-1998" includes a justification and proposal for the comparative study of electoral systems, though this does not contain any request for support to study the role or use of the media in election campaigns in a comparative fashion.

3 In three of the four countries -- Germany, Britain and Spain -- panel studies were conducted of representative national samples of the electorates. The German study is the first for which the media effects analyses have been completed (see Semetko and Schoenbach, forthcoming). Semetko is grateful for the support Research Fellowship from the German Marshall Fund of the United States (1990-91) which provided partial support for the German election study. In the U.S. a single post-election survey was conducted due to the budget constraints (cf. Beck, Dalton and Huckfeldt 1993).

4 Two days in September and one in October are not included here for NBC. All news on all three main networks will be included in the final project. The content analysis of U.S. network TV news was supported by a grant from the Joyce Foundatoin.

5 I am grateful for the access to NBC Nightly News during the week of October 19th, and especially to Don Browne, Bill Wheatley, Tom Brokaw, Lisa Meyers, Steve Friedman, Jeff Zucker, and the many others on the staff who agreed to be interviewed and to work under observation.

6 An extensive analysis of the coverage in the German campaign, as well as its effects on public opinion, is provided in Semetko and Schoenbach, forthcoming. I would like to especially thank Klaus Bresser and Klaus Peter Siegloch at ZDF, as well as the many who agreed to be interviewed during my observation week at ZDF's "heute" main evening news program in October 1990. I am also grateful for access to ITN's "News at Ten" for thirteen days during the British 1992 campaign, and especially to Glyn Mathias and the many others who agreed to be interviewed. A detailed analysis of the British data can be found in Semetko, Nossiter and Scammell, forthcoming.

Paper presented at Conference Group on German Politics and Society panel "Dimensions of Change in Germany: Comparing East and West" at the annual meetings of the American Political Science Association, Washington D.C. September 1993.

Abstract

This preliminary report concerning waves one and two of an ongoing three-wave panel study among East and West Germans shows that levels of exposure to news media are high and have remained so over the past year in both parts of Germany, but generally higher for mainstream media (radio news, television news, and local newspapers) in the East than in the West. Secondly, interest in political reporting in the press and on television has declined slightly in the East over the past year while increasing slightly in the West.

The results from a first attempt to assess whether exposure to and interest in media coverage influenced strength of political efficacy suggests that media do exert an influence, though the sources and direction of effects were not uniform in both parts of the country.

MEDIA USE AND INTEREST AMONG EAST AND WEST GERMANS

Holli A. Semetko and Klaus Schoenbach

The celebrations over the unification of Germany in October 1990 were extended by the Bundestag election campaign until December 2nd of that year, when citizens in both parts of the country voted to return the incumbent CDU/CSU-FDP ruling coalition. Since that time, the economy has worsened, inflation has risen and, for a time, acts of violence against foreigners and asylum seekers were almost an everyday occurrence in one or another part of the country. Opinion about the parties of government shifted dramatically soon after the election, initially because of broken campaign promises on tax increases, and has continued to worsen. Recent polls indicate that if an election were held tomorrow, the coalition as currently configured would not retain a majority in the Bundestag. The most dramatic opinion shifts occurred in the Eastern part of the country, where citizens in large numbers voted for the CDU, but have since become increasingly supportive of the SPD while at the same time dissatisfied with both main parties.

The December 1990 national election was the first time citizens in both parts of the country voted in free elections for a joint federal parliament in over fifty years. It marked the beginning of a transition to democracy in the East. This brief report outlines some preliminary

findings from an ongoing three-wave face-to-face panel study of nationally representative samples of East and West Germans, which began in 1992 and will be completed in 1994. The study involved comparable surveys of publics in both parts of Germany, to assess political and social attitudes during this important and unprecedented time of transition.

The first waves were fielded in late February and March 1992, with 2,531 respondents in the West and 2,329 respondents in the East. The second waves were fielded in March 1993, with 1,652 respondents in the West and 1,515 in the East. This represents a panel retention rate of 65 percent in both parts of the country. The third waves will be fielded in spring 1994. 1

This paper addresses two general questions: How does media exposure and interest in political news compare among East and West Germans? Is there a relationship between media use and political efficacy among East and West Germans?

The media were an important source of information for electors in both parts of the country during the 1990 national election campaign, and particularly in the East where citizens displayed a greater 'need for orientation' (cf. Semetko and Schoenbach, forthcoming). Over an eight week period during the 'hot phase' of the campaign -- when the political parties' campaigning activities were well underway with billboards and posters on display, regular rallies, and numerous print and television ads, and

politicians featured regularly in the news media -- a number of short-term effects were caused by being exposed to campaign information or being interested in it (ibid). These included effects on issue salience, sympathy with the political parties and the top candidates, and knowledge about leading politicians and the parties' stands on the issues.

Exposure to Media and Interest in Political News

Almond and Verba (1964) described West Germans as well informed about politics and interested in following politics actively in the mass media. Baker, Dalton and Hildebrandt (1980) show how television became a major source of information and basis for the politicization of the German public over the course of the 1960s. Because of the Germans' extensive reliance on the media for news and information and because of the effects observed over the short eight week 1990 national election campaign, a number of media exposure and interest questions were included in the long-term panel study of East and West Germans. The routine reliance on the media for news and information was assessed with questions about how often (every day, almost every day, most days in the week, once a week, less, never) one reads newspapers, watches television news, or listens to radio news. Respondents were asked specifically how often

they read: the Bild, a national tabloid newspaper with regional inserts now available in both parts of the country; a local newspaper that reports about events in the city or town; and a national newspaper such as the FAZ, WELT, taz, the Sueddeutsche Zeitung or the Frankfurter Rundschau. These national newspapers are available around the country and vary in their political leanings with the FAZ and WELT on the right, and the Sueddeutsche center left, and the others on the left. Respondents were also asked about how interested they were in political reports in newspapers, and on television news (very strongly, strongly, somewhat, little, not at all).

Television news is the source of information relied upon by the largest proportion of the publics in both parts of the country. Between 89 and 92 percent watch TV news every day or almost every day. Regional newspapers are almost as important, between 78 and 86 percent read them regularly, closely followed by radio news which between 75 and 83 percent of publics turn to regularly. The 'prestige' or national newspapers are read by less than ten percent of the publics in both parts of the country. The Bild is a more important source of information in the West, where it is read by about 19 percent of the public, than in the East, where only about 6 percent read it regularly. Figure 1 displays the panelists' responses to the exposure questions.

Figure 1 shows that routine media use, as one would expect, hardly changed over the past year, in either part of

the country. Citizens in the East are more avid TV viewers, radio listeners, and local newspaper readers than citizens in the West, though three-quarters or more of West Germans regularly turn to these news media. The German public, therefore, is potentially a very well informed public. To put these findings in perspective, it is worth noting that when a representative national sample of the U.S. public was asked how often they read a newspaper or watch television news, only 47 percent and 44 percent said they did so regularly -- between 5-7 days in the past week (Semetko 1993).

Figure 1 about here

East Germans, in addition to being more often exposed to local newspapers and television news, are substantially more interested in the political coverage in these media than West Germans, despite the fact that interest has declined slightly since 1992 in the East while it has increased slightly in the West. In 1993, 45 percent of East Germans and 40 percent of West Germans were 'very strongly' or 'strongly' interested in political reports in newspapers, and 63 percent of East Germans compared with 53 percent of West Germans were interested in political coverage in TV news programs, as is shown in Figure 2.

Figure 2 about here

Media Influences on Political Efficacy

Four questions in the survey were combined into a single five point index to assess citizens' feelings of political efficacy, in other words, how much they personally feel they can influence the system. These items are listed in Figure 3.

Figure 3 about here

The five point political efficacy index ranged from very weak to very strong.

From the outset, the German public in both parts of the country was generally weak on the political efficacy scale. No more than 22 percent of the public ranked 'very strongly' or 'strongly' in both years, and this was as low as 15 percent, as can be seen from Figure 4. Political efficacy has also declined in both parts of the country over the past year.

Media exposure and interest measures were used as independent variables in a simultaneous multiple regression equation predicting strength of political efficacy in 1993. Exposure to radio news, television news, the Bild, national newspapers, and local newspapers in 1993 were the independent media exposure variables. Interest in political coverage in the press and on television news in 1993 were

also included as independent variables. 2 The dependent variable was lagged by including the political efficacy measure in 1992 as an independent variable in the equation (cf. Achen 1982:55).

Separate equations were run for the East and for the West. The results are in Table 1.

Table 1 about here

For East Germans, the following variables emerged as significant, in order of importance: efficacy in 1992, exposure to 'prestige' national newspapers, exposure to television news and exposure to radio news. Strength of political efficacy in 1992 was significantly correlated with the dependent variable in 1993 (beta .23). There was a considerable amount of change, though, suggesting that political efficacy is more of a state than a trait. It is likely to be influenced by new impressions of politics. Reading a national 'prestige' newspaper enhanced political efficacy (beta .15), as did listening to radio news (beta .07). Viewing television news, however, diminished political efficacy (-.07). This is not because television news viewers were particularly unefficacious from the outset -- the inclusion of our wave one measure of efficacy controls for this. Interest in newspaper coverage of politics was nearly significant at the .05 level (beta .07),

and positively associated with strength of political efficacy.

In the West, however, different media measures emerged as having a significant impact on West Germans' feelings of political efficacy. Again, political efficacy at the first wave was the strongest predictor (beta .24). In contrast to the East, exposure to radio and television news were not significant influences on West Germans' feelings of political efficacy. Reading a 'prestige' national newspaper, however, as in the East, was positively correlated with political efficacy (beta .17). Exposure to the daily tabloid Bild, though, was negatively correlated with the dependent variable, indicating that reading the Bild diminished political efficacy (beta -.12). Finally, as interest in political coverage in the press (beta .13) and on television news (beta .10) increased, so did strength of political efficacy.

Conclusions

Several general conclusions can be drawn from this preliminary report concerning waves one and two of an ongoing three-wave panel study among East and West Germans. One is that levels of exposure to news media are high and have remained so over the past year in both parts of Germany, but generally higher for mainstream media (radio news, television news, and local newspapers) in the East

than in the West. Secondly, interest in political reporting in the press and on television has declined slightly in the East over the past year while increasing slightly in the West. Thirdly, political efficacy -- measured by a four item index or scale -- was relatively weak in both parts of the country in 1992 and became weaker over the past year.

Finally, the results from a first attempt to assess whether exposure to and interest in media coverage influenced feelings of political efficacy suggests that media do exert an influence, though this was not uniform in both parts of the country. While exposure to television news served to diminish political efficacy among East Germans, it was not a significant influence in the West. In the West, however, exposure to the Bild, a national daily tabloid, diminished political efficacy. At the same time, other sources of information enhanced strength of political efficacy -- exposure to radio news and 'prestige' newspapers in the East, and exposure to the latter in the West. Being interested in political coverage in newspapers and in television news also enhanced political efficacy in the West though it was not significant in the East. All of these media effects on political efficacy in 1993, it should be remembered, emerged while controlling for political efficacy in 1992. This suggests that use of and interest in some media over the past year had important consequences for one's feelings of political efficacy.

Although we have no formal content analysis of the media coverage in these outlets over the past year, as media users we can offer some general comments which may help to explain these findings. The 'prestige' national newspapers are not sensationalist in their coverage of politics and the government. Their coverage might be described as generally "staatstragend." Exposure to the 'prestige' press strengthened feelings of political efficacy among readers in both parts of the country. The national tabloid Bild, however, is often quite critical of politicians generally and in a sensationalist way. Exposure to the Bild weakened political efficacy among West Germans. In the East, exposure to television news diminished political efficacy and one might speculate that this could be related to East Germans' greater reliance on private television channels for news. These news programs are competing with the public service channels for audiences with a more upbeat and entertainment-oriented reporting style. If news on the private channels is the television equivalent of the Bild, then it is not surprising that it diminishes feelings of political efficacy. Finally, being interested in political coverage (not just simply exposed to it) may make citizens more aware of the intricacies of politics and the difficulties of finding solutions to complex problems. Interest in political coverage in the press and on television emerged as significantly and positively associated with strength of political efficacy in the West.

A next step in the analysis will be to look more closely at the relationship between interest and political efficacy (cf. Baker et al. 1980), to establish whether these exposure effects remain when interest is used as a contingent condition.

Notes

1 The study was conducted by **ipos** in Mannheim, in collaboration with the author and representatives from the organizations which supported the study -- the Bundespresseamt, the Konrad Adenauer Stiftung and the Friedrich Naumann Stiftung. See **ipos** 1992a, 1992b, 1993a, 1993b.

2 Traditional demographic indicators such as education, gender and age are excluded from this analysis because we take account of the dependent variable at the first wave and are interested in the effects of media on the change in the dependent variable at the second wave.

SURROGATE MOTHERHOOD AND THE IDENTITY OF WOMAN

Loretta A. Sernekos
Department of Political Science
Rutgers University
New Brunswick, NJ 08903

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

INTRODUCTION

There can be no doubt that the practice of surrogate motherhood raises profound questions about motherhood more generally. Women becoming simultaneously grandmothers and mothers of children (Gruson 1993, Schweitzer 1992), writers asking when a mother is not a mother (Pollitt 1990) and a surrogate mother joking that she should hang a sign on her chest that says, "I'm not the mother" ("Baby Craving", 38) are just a few examples of the kind of confusion and ambiguity generated by the practice of surrogate motherhood. Five years ago, the questions focused on whether a surrogate, who was the genetic mother, had the right to claim the child as her own (e.g., the Baby M case). More recently, the practice of gestational surrogacy[1] has forced the legal system to decide who the "natural" mother is when there are apparently at least two "natural" mothers: the woman whose ovum was fertilized and the woman who gave birth.

I want to argue in this paper that for all the apparent destabilization of motherhood, the discourse of surrogate motherhood found in legal and medical texts, popular culture and elsewhere produces a symbolic Mother that is stable and knowable, grounded immutably in nature/biology and thus,

---

[1]Gestational surrogacy is the practice whereby a fertilized ovum is implanted in the womb of a woman who has no genetic relationship to the future child.

seemingly certain.[2] That is, rather than viewing surrogacy as the annihilation of motherhood, as some feminists do, I view it as productive of motherhood; the discourse of surrogacy is a discourse of motherhood. But at the same time the mother is produced, the practice of surrogacy and contradictions within the discourse of surrogacy threaten to reveal that very production and the discursive construction of maternal stability and certainty. It becomes obvious that motherhood was always a construction, with a history and a future. In other words, motherhood as a specifically located social relation becomes apparent. More fundamentally, any certainty about what motherhood "is" that is based on biology-as-bedrock is revealed as questionable. But I do not want to argue that surrogate motherhood suddenly makes motherhood unstable and uncertain and that the discourse must then repair the damage to that certainty

---

[2]"Discourse" and "production" are social terms of analysis. Their use signals a fundamental skepticism about anything called "nature" or "natural". Analyzing surrogate motherhood as a discourse on motherhood that produces the Mother allows us to think about motherhood as a discursive, social construction and as a shifting category that has a history. If it has a history, we can think about what the dominant discourses of motherhood have been in the past, but we can also think about its future. Thinking about surrogacy in this manner also makes it easier to see how motherhood has been naturalized into a "biological fact", as well as a cultural ideal. Because the practice of surrogate motherhood (and related reproductive technologies) can sometimes seem extreme (almost science-fiction), it can starkly lay bare the extent to which motherhood has been constructed. But because surrogacy is about both biological and social processes, it can also allow us to think about the position of the Mother, on the boundary of nature and culture, and thus, to think about what is at stake in symbolic constructions of the Mother.

(although it brings to our attention certain scientific innovations that create new possibilities in human reproduction). Rather, the discourse of surrogacy reveals that the figure of the mother was never as certain as we might like to believe.

Among many feminists, there is a desire to cling to the physical maternal body as a sort of theoretical *terra firma*. One would get little argument from most feminists that the institution of motherhood is a social idea, but there is a tendency among disparate feminists for theorizing to stop at the boundary of the body, as though it remains the one biological referent that we can depend on, inaccessible to representation; it is the "real" woman, coded biologically female, as opposed to the cultural construction Woman. In this view, the body remains the one thing that is real about all women, outside discourse and belonging solely to women. The visible maternal body assures women of the certainty of motherhood. But I would argue that a comfortable reliance on the idea of a prediscursive maternal body is a dangerous position for feminists to take. It may unintentionally support attempts to locate women more firmly than ever within biology and it may prevent us from seeing not only the dangers of surrogacy and other reproductive technologies, but the possibilities as well.

Drawing on the work of Simone de Beauvoir and others, Judith Butler makes the argument that the body is not knowable outside of discourse, arguing that our experience of our own bodies is inextricably embedded in cultural expressions of gender; there

is no "pure" body (1986, 39). Instead, Butler argues, the body "is a material reality which has already been located and defined within a social context.... [It] is a field of interpretive possibilities, the locus of a dialectical process of interpreting anew a historical set of interpretations that have become imprinted in the flesh" (45, emphasis in original). Social conceptions of the body and gender cannot be neatly unlinked to distill an essence of the body. In other words, to talk about Woman, the cultural construction of bodies coded biologically female, is to talk about the body, for Woman and the female body can never be completely distinct. This view of the body does not mean that we cannot discuss the materiality of the body, nor the idea that women can be oppressed and/or exploited through their bodies, nor women's physical experience of pregnancy and childbirth. Indeed, I would argue that politically, it is crucial for feminists to continue to criticize and publicize the kinds of physical oppression women endure in the process of surrogate motherhood, infertility treatments, etc. We need to discuss what we may see as the dangers of surrogate motherhood, and we have every reason to be worried about reproductive technologies that threaten to dehumanize women and deny us our subjectivity. But the view of the body I want to work with insists that we cannot somehow reclaim or recover a pure body. It acknowledges the

historicity of our concepts of the body.[3]

Although giving up the idea of the body as the assurance of the certainty of motherhood is difficult for feminists, this is precisely the work we must do, if we are to seize the possibilities presented by surrogate motherhood (and related reproductive technologies). Surrogacy, with its confusion of just who is a mother, socially and biologically speaking, erases the certainty of and begins to unhinge the identity Woman:Mother. That is, by confusing what Mother means, it confuses what Woman means. Feminists have a stake in this confusion: to disconnect Woman from Mother holds a radical promise, not only in the ways we think about Woman and women,[4] but in how we think about reproduction and the body itself. The identification of Woman with Mother is firmly linked with social ideas about reproduction and the physical maternal body. In fact, the discourse of surrogacy can at times lay bare the connection between Woman and the physical body in stark terms: Dr. Lee Salk described surrogate mother Mary Beth Whitehead as a "surrogate uterus" (Chesler 1988, 14). It is the tension of a discourse which simultaneously reveals and reveils

---

[3]See Laqueur (1990) for an excellent account of the ways in which conceptions of the sexed body and gender have changed over time. Foucault (1978) also insists on the historicity of the body and the idea that it is not a biological referent.

[4]To oversimplify, every woman is seen either as a mother or a potential mother. Ideas of women's subjectivity and of what it means to be a woman are inextricably bound up in the idea of woman-as-mother. This also means that the meanings of woman-as-citizen or woman-as-worker are linked with motherhood.

the constructedness of the Mother which feminists must work with in approaching the subject of surrogacy, and it is this tension which presents opportunities for feminist theorizing. But if we regard the maternal body as the last bastion of the real woman, a biological referent, those opportunities can be lost. In fact, feminists may end up performing some of the work of the discourse of surrogacy so many of them oppose. It is very easy to slide from ideas of the body-as-theoretical-bottom-line to ideas of the body-as-destiny.

SURROGACY AND THE CYBORG

I do not wish to imply from the above discussion that I am uncritical of the practice of surrogacy. Indeed, surrogacy has a double-edged quality to it: it provides a radical moment and a wedge with which feminists can begin to ask critically important questions about motherhood. But it can also function, with its reliance on ideas of maternal instinct and biological bedrock, to "fix" Woman in motherhood more firmly than ever. My task in this paper is not to take up a position "pro" or "anti" surrogacy and defend that position. I have argued elsewhere (1992) that feminists have engaged in a sort of gridlocked debate over surrogate motherhood, with neither side being persuaded of the validity of the other side's approach. Rather, my approach is based on my understanding of Donna Haraway's (1989) image of the cyborg as a way out of that sort of pro/anti debate.

It is the very double-edged quality of surrogate motherhood,

as well as its potential to reveal the constructedness of motherhood, that led me to the work of Haraway. The trope of the cyborg, as she develops it, can be a useful way for feminists to think about surrogate motherhood. The cyborg is neither completely natural nor artificial. Its existence disturbs comfortable dualisms that have been available to Western epistemology. But Haraway is well aware of the double edge of the cyborg: while it has the potential to give us a new way to think about the body, nature, identity and politics, at the same time there is the possibility that cyborgian technology could impose a "grid of control" on our world and indeed, destroy our world.

In her article, "A Manifesto for Cyborgs: Science, Technology and Socialist Feminism in the 1980s" Haraway explored the idea of the cyborg, "a hybrid of machine and organism, a creature of social reality as well as a creature of fiction" (174). Throughout the essay, Haraway maintains a tension between the potentially awful aspects of the cyborg and its potentially subversive, transformational aspects. Her disgust with and fear of the kind of "star wars" technologies and attitudes that spawned the cyborg is apparent, but she also urges feminists to take pleasure in the confusion of boundaries the cyborg engenders, as well as to take responsibility for the construction of those boundaries:

> From one perspective, a cyborg world is about the final imposition of a grid of control on the planet, about the final abstraction embodied in a Star War apocalypse waged in the name of defense, about the final appropriation of women's bodies in a masculinist orgy of war. From another perspective, a cyborg world might

> be about lived social and bodily realities in which people are not afraid of their joint kinship with animals and machines, not afraid of permanently partial identities and contradictory standpoints. The political struggle is to see from both perspectives at once because each reveals both dominations and possibilities unimaginable from the other vantage point. (179)

The task for feminists is not to demonize the technology that spawned the cyborg, but to understand and utilize the cyborg's dangers and possibilities. Once the cyborg is created, it has the potential to escape the boundaries constructed for it by its fathers, despite efforts to contain it. It might be "exceedingly unfaithful" (176) to its origins.

According to Haraway, because it is part organism, part machine, the cyborg introduces uncertainty into some old dualisms: human/animal, organism/machine and physical/non-physical. In short, the cyborg results in fractured identities. But fractured identities can provide a kind of affinity politics, rather than a politics based on a totalizing, unitary identity which excludes many. The simultaneity of breakdowns of clear distinctions "cracks the matrices of domination and opens geometric possibilities" (197). The biggest problem in the age of the cyborg is communications breakdown: the "grid of control" is subject to interference by noise. It is this noise-making and simultaneity of breakdowns that represent at least part of the possibilities of the cyborg feminists can seize.

Surrogacy is cyborgian, I would argue, because it threatens to explode existing discourses about motherhood. It has the potential to lay bare the cultural construction of motherhood

and contribute toward the feminist task of deconstructing Woman. It raises questions about the "naturalness" of the maternal body by creating competing claims to sole ownership of the status of the "natural" mother. In so doing, it provides a wedge with which feminists can ask critical questions about the meanings of motherhood. But at the same time, it threatens to reinscribe existing discourses of motherhood more firmly than ever. This is one of the dangers of the cyborg: "Technologies and scientific discourses can be partially understood as formalizations, i.e., as frozen moments, of the fluid social interactions constituting them, but they should also be viewed as instruments for enforcing meanings" (Haraway 1989, 187). One of the tasks of the discourse of surrogacy is to rein in the threatening possibilities and reinforce the existing code of motherhood as well as rewrite that code. By "reinforce and rewrite", I mean that the discourse of motherhood has recurring themes such as maternal instinct, maternal love, biological impulses, etc. which are reconstituted by the particular social conditions of the time. In other words, motherhood is a fluid and historical concept that is made to appear timeless and static by the invocation of certain ideas. This apparent stasis masks the constructedness of motherhood. For example, maternal sacrifice and selflessness is one of the ideals invoked by the practice of surrogacy. But less than 150 years ago, actual physical suffering during labor and delivery were seen as a crucial element of maternal sacrifice; such suffering <u>made</u> one a

mother.[5] Today, we do not speak of motherhood in terms that involve precisely the same suffering, and yet the ideal of maternal sacrifice lives on in new ways. For example, infertile women suffer psychologically and physically in the process of trying to become pregnant and more importantly, are <u>expected</u> to suffer.[6]

Policing the discourse of motherhood is a risky undertaking. As Haraway describes them, cyborgian boundaries can be leaky and, I would add, filled with contradictions. So as the constructedness of motherhood is veiled by the practice of surrogacy, that same practice constantly threatens to reveal the construction. As boundaries are shored up, boundaries are confused. Here is where feminists can seize the possibilities engendered by such a cyborgian practice. In addition to the "ah hah! Now we've got you!" kinds of revelations (which are not unimportant), feminists potentially can use the cyborg called surrogacy to reveal the construction of motherhood and thus, deconstruct the discourse of motherhood and Woman. The

---

[5]See Poovey (1988) for an interesting discussion of the ways that notions of maternal suffering came into play in the debate over the use of chloroform in labor and delivery in mid-Victorian England. The use of chloroform was opposed by some because it relieved the woman's suffering, which had been decreed by God.

[6]For example, see the cover story on actress Deidre Hall and the surrogate mother of her child in the September 28, 1992 issue of <u>People</u> magazine (Levitt & Benet 1992). Ms. Hall's attempts to become pregnant are told in self-sacrificing terms that can only be described as martyr-like. Her suffering is made to seem inevitable and, in fact, a requirement for the end "product", a child.

political implications of disrupting the Woman:Mother identity are large and would force a rethinking of women's status as subjects, as citizens, etc., as well as a shift in the way the category of motherhood is conceptualized. This, of course, is the optimistic version of the cyborg. The darker version, and the version which Haraway keeps in tension, is that there is always the danger of a backlash against any threats the cyborg is perceived to present. By this I mean that the cyborgian practice and the discourse of the cyborg may threaten to reveal or undermine the foundation on which the cyborgian practice rests. If surrogacy appears to threaten the cultural meanings of motherhood, there will likely be further attempts to reinscribe those meanings. That is one reason why feminists need to resist talking about the body in ways which feed into such reinscriptions.

THE DISCOURSE OF SURROGACY AND THE CERTAIN MOTHER

As I stated in the introduction to this paper, the discourse of surrogacy constructs an image of certain, stable motherhood, grounded in seemingly immutable biology - nature, in other words.[7] But at the same time that the discourse of surrogacy

---

[7]The discourse of surrogacy also constructs the mother as heterosexual and white, which I have discussed in an earlier paper (1992). For this paper, I will confine my analysis to the construction of the mother as "natural" and embedded in nature, in order to make clearer the connection between that construction and attempts to assure the mother's certainty through a reliance on the idea of a prediscursive maternal body.

produces the mother, that production is constantly threatened by contradictory discourses within and supporting surrogacy (i.e., related discourses of infertility[8] and other reproductive technologies), as well as leaks in the boundaries of surrogacy and attempts to plug those leaks. Haraway says the cyborg undermines what counts as nature (177), or perhaps more correctly, the natural. The concepts of nature and the natural, divorced from social meaning, are absolutely crucial to the ideology of motherhood and thus, the discourse of surrogacy. Maternal instinct and maternal love, both of which are discursively constructed as springing from biology, are supposed to be the "natural" bedrock of motherhood.

For example, the infertile woman, whose infertility results in the "need" for a surrogate, is portrayed as a slave to her "biological clock" which she must "race" against.[9] As Sherman J. Silber, M.D., an infertility specialist, has stated:

---

[8]The discourse of infertility is integral to the discourse of surrogate motherhood. It is that discourse which constructs the image of the Infertile Woman who "needs" surrogacy as a "solution" to her infertility, which drives her to "desperate" measures to obtain the child her body is clamoring for.

[9]The "biological clock" is a crucial discursive construction supporting the discourse of infertility and surrogacy (as well as other reproductive technologies). This concept, borrowed from the idea of 24-hour circadian rhythms (e.g., sleep patterns) is a metaphor that describes women's reproductive life cycle from menarche to menopause. In the last 20 years, the ticking biological clock has discursively attained the status of the real and biologically concrete, to the point that McKaughan asserts: "[The biological clock] controls the life cycle of our reproductive system" (1987, 111; from a chapter titled "Our Real Biological Clocks").

"[The infertile woman's] biological clock is ticking and she's going to run out of fertilizable eggs fairly soon" (1991, 17). This emphasis on time and the "biological clock" serves to locate reproduction and thus, women, in nature and natural rhythms from which they cannot escape. But at the same time, this move is constantly undermined by technology which makes time seem more and more meaningless. Recent instances of post-menopausal women being impregnated and delivering children (e.g., Gruson 1993) contradict the concept of the biological clock. But rather than reject the concept, the discourse retains it and describes the biological clock as "beatable" ("Beating the Clock") or as "turned back" (Rosen & Moneysmith 1990). Maternity is reinscribed in the realm of nature, instincts and drives. If women have a biological clock, then they are obviously driven by nature to reproduce, and on a schedule at that. Magazine articles confirm this: In a cover story in For Women First on women over 40 having babies, a sub-headline read, "It must be instinct" ("Beating the Clock", 7). The cover of a Ladies Home Journal declared that a special report inside was "The Need to be a Mom" (Casey 1992). The summary of the article inside, in large type, declared, "Married and single, young and not so young, women are once again deciding to have babies simply because they want them - even if it's not convenient, even at risk to their careers, health or relationships" (100). Women driven by their biological clock will sacrifice anything to become a mother.

We are to believe that the call of nature, with its clock

ticking inexorably, will get even the most determined women. For example, Time ran a cover article on February 22, 1982 with a picture of actress Jaclyn Smith holding her swollen abdomen. The headline read: "The New Baby Bloom." Inside, the story detailed a supposed "astonishing" rise in the birth rate of women in the 30-44-year-old age bracket. (The article gives no time parameters in which such a rise took place.) While acknowledging the large size of the cohort of baby-boom women contributing to the overall birth rate, the article goes on to give a quite mythological account of the increase in the numbers[10] of older women having children:

> But sheer numbers hardly explain this flowering of fecundity. For many women, the biological clock of fertility is running near its end. Menopause will strike at midnight. The ancient Pleistocene call of the moon, of salt in the blood, and genetic encoding buried deep in the chromosomes back there beneath the layers of culture - and counterculture - are making successful businesswomen, professionals and even the mothers of grown children stop and reconsider. ("The New Baby Bloom", 52)

The startling language of this passage reveals a notion of motherhood that is embedded in nature, but somehow has become layered in culture. Yesterday's hippies who have become today's yuppies apparently have come to their senses and realized that they want neither peace nor money; they want a child.[11] Once

---

[10]Many articles on infertility and the birth rate, such as the Time article being discussed, use the terms (percentage) "rate" and (discrete) "number" interchangeably, depending on the emphasis desired.

[11]I am indebted to Linda Zerilli for this analysis.

the layers of culture and counterculture are peeled off, the moon, salt in the blood and genetic encoding make the call of motherhood irresistible; the body is the point at which culture ceases to operate. This is precisely the type of argument about motherhood that I want to challenge and one which feminists may appear to be embracing when they conceptualize the maternal body as beyond theory and discourse. The notion that we can somehow remove the layers of the social that have been heaped on top of the "natural" female body and discover the "natural core" of motherhood implies that no matter how much we analyze motherhood, no matter how much practices change, there is always and ultimately some eternal biological truth beyond which we can go no further.

Such dependence on concepts of the natural serve to conceal the construction of motherhood both as ideology and social practice. Of course, one is immediately struck by a contradiction: the extent to which medicine intervenes in the "natural" processes of motherhood, particularly in treatments for infertility, brings the "naturalness" of that process into question. Further, if the natural basis of motherhood and maternal love spring from biology, why would a surrogate ever give up the child? In response to this, the surrogate is routinely portrayed as wanting (in a rather saintly way) to give the gift of a child to another couple so that they may experience the kind of maternal love she understands so

well.[12] Alternatively, the surrogate may deny that the child is hers at all, and say that she is simply nurturing it for someone else.[13] As can be seen, the attempts to shore up notions of natural maternal instinct based on biology are immediately undermined by the practice of surrogacy itself. These are the kinds of insights feminists can make and exploit if we view surrogacy with the kind of dual edge I am urging.

Anna Johnson and Crispina Calvert: Will the Real "Natural" Mother Please Stand Up?

Concepts of the natural are also undermined in an interesting way in gestational surrogacy. The gestational surrogate, as the name implies, is implanted with another woman's ovum (or multiple ova) that has (have) been fertilized in vitro. There was a time when the act of giving birth legally defined one as a mother, or so it seemed. The legal doctrine was stated as, "*mater est quam gestatio demonstrat*" ("the mother is demonstrated by gestation"; quoted in U.S. Congress, Office of Technology Assessment 1988, 282). That is, the visible pregnant woman's body signified her maternity; no further discussion was required. But in legal cases surrounding gestational surrogacy, the courts have had to find a "more natural" basis of motherhood than gestation.

In a case in California, a gestational surrogate, Anna

---

[12]See the People magazine article about Deidre Hall and the surrogate, Robin B. referenced in fn. 6.

[13]See Corea (1985, 222) for a discussion of surrogates who refer to themselves as "incubators" and "nest watchers".

Johnson, made the claim that she, too, was the mother of the child, although she had no genetic relationship to him. Johnson was a nurse's aid employed in the same hospital as Crispina Calvert, who was unable to bear children due to a hysterectomy, but whose ovaries remained intact. Johnson and Crispina and Mark Calvert entered into a contract whereby Anna agreed to be implanted with Crispina's fertilized ovum, carry the child and deliver it to the Calverts for $10,000. Late in her pregnancy, Johnson said she had bonded with the child and besides, the genetic parents had been unkind to her when she became ill during the latter part of her pregnancy.[14] (Presumably this point was raised to show that the genetic parents would not be loving social parents.) She demanded to be named the child's mother and given custody or at least visitation rights. But a child with two mothers was a situation "ripe for crazy-making" (Annas 1991, 35) the trial court said, and so it set about finding the elusive "more natural" basis of motherhood.

Ultimately, the search for this "more natural" motherhood settled on genetics. Johnson did not dispute the fact that she

---

[14]Johnson was also quite distressed due to her economic situation. She had gone into premature labor and was unable to work for the last two months of her pregnancy. At the same time, her landlady announced that Johnson and her daughter would have to vacate their rented house because it was being sold. In a letter, Johnson pressed the Calverts for an expedited payment schedule because she could not afford the advance rent and security deposit on another home. (This letter was reproduced in full in Anna J. v. Mark C., 286 Cal.Rptr. at 372.) The Calverts responded by filing a lawsuit to be declared the legal parents of the unborn child; Johnson countersued to be declared the legal mother.

was not the genetic mother of the child, but tests were performed to prove, and thus certify, that she could not be the "natural" mother and that the Calverts were the "natural" mother and father with a 99.99% probability. In support of his opinion that Crispina Calvert was the sole "natural" mother, Richard N. Parslow, Jr., the trial court judge, described Johnson's role as a "host" whose role was "analogous to that of a foster parent providing care, protection and nurture during the period of time that the natural mother, Crispina Calvert, was unable to care for the child [i.e., in utero]" (Johnson v. Calvert, Reporter's Transcript, p. 5).[15] Judge Parslow was persuaded by testimony that genetics play a much more decisive role in who a person is than the "gestational environment" (8). Judge Parslow's opinion was upheld by a California appellate court[16] and very recently by the California Supreme Court.

I would argue that this search for a "more natural" basis of motherhood than giving birth, rather than fixing the certainty of the natural mother (as it attempts to do), reveals the tenuousness and fragility of the notion of a natural basis of motherhood that is devoid of any social meaning. It also reveals that any conception of motherhood which is based unproblematically on the visible maternal body was also always a

---

[15]I am very grateful to Anne L. Goodwin, Esq. of St. Louis, MO for making a copy of this Transcript available to me.

[16]See Anna J. v. Mark C., 286 Cal.Rptr. 369 (Cal.App. 4 Dist. 1991).

construction. The Johnson decision seems to represent a kind of search for the "lost" maternal body, "found" in the genes. For the moment, at least, we find that it is genetics that provides the "real" basis for "natural" motherhood. (In his opinion, Judge Parslow consistently referred to the genetic mother as the "natural mother.") If the child has your genes, you must be the mother.[17] We begin to see why gestational surrogacy might be seen as preferable to classic surrogacy, in which the birth mother is artificially inseminated with the sperm of the contracting father. The genetic arguments would not have worked against Mary Beth Whitehead; she was Baby M's genetic mother. But if genes are today's basis for "real, natural" motherhood, what might be tomorrow's basis?[18] Asking this question makes it apparent that "real, natural" motherhood is and has been discursively constructed.

The Johnson case also made clear that surrogacy challenges

---

[17]This "solution" to the some of the "problems" of surrogacy is, of course, indebted to decades of genetic research which occurred in tandem with, but not necessarily intentionally connected to, research in reproductive technologies. This genetic research is then framed and/or used as needed by the discourse of surrogacy.

[18]The idea of genes being the basis for motherhood is contradicted by the current practice of egg "donation". In this practice, young women donate ova to women who can gestate a child, but who have no ova or who have a very small chance of becoming pregnant with their own ovum. The egg donors are required to sign away their rights to the child, and so in this case, it is the gestational mother who claims motherhood, not the genetic mother. As Jyl Josephson pointed out to me, in each case it is the woman who "belongs" to the man/father who is given the title "mother."

the singularity of motherhood. By this I mean the idea that there is always an identifiable true mother who is the mother. With surrogacy, however, there seems to be a biological basis for at least two mothers: the process of gestation and birthing, and the giving of the ovum/genes. Giving birth seems to have been put in a category of less-natural, or perhaps pre-genetic by the Johnson decision. A subtitle in a New York Times article on the decision said, "In a debate over nature versus nurture, the winner is nature" (Mydans 1990). Anna Johnson's giving birth was apparently "nurture", rather than "nature." Such semantic acrobatics reveal the move toward fixing the certainty of the mother. We have to ask: what is so scary about having two mothers, anyway? Why can't the gestational surrogate make and sustain a claim for motherhood? The answer may lie in the idea that if there could be more than one mother, perhaps no one is the mother. Perhaps an endless number of people could have a claim to be the mother of that child.[19] Perhaps the idea of motherhood has been constructed, after all. We begin to see how important it is to the discourse of surrogacy to maintain the idea that there is one, certain mother or risk collapsing the concept of the mother. Surrogacy may unintentionally reveal the production of the certainty of the mother in the very process of producing her.

---

[19]As one of my students once said in class, "What's next? Will the lab technician who mixes the sperm and the egg be able to claim she is the mother?"

UNCERTAIN PATERNITY AND CERTAIN MATERNITY

Again and again in reading commentary on surrogate motherhood, reproductive technologies and motherhood more generally, one is struck by a recurring theme: paternity may be uncertain, but motherhood is most definitely certain. Consider the following two quotations, one by a feminist theorist, the other by Judge Parslow:

> No uncertainty can exist about knowledge of maternity. A woman who gives birth is a mother and a woman cannot help but know that she has given birth; maternity is a natural and a social fact. But a considerable gap in time separates any act of coitus from the birth of a child; what then is the connection between the role of the man in sexual intercourse and childbirth? Paternity has to be discovered or invented. Unlike maternity, paternity is merely a social fact, a human invention. (Pateman 1988, 35)

> One of the reasons why we had a presumption that the person from whom the child emerged was the mother is it made that side of the transaction clear at birth. Paternity was always a matter of opinion, but you could always establish who delivered the child. (Johnson v. Calvert, Reporter's Transcript, 18)

One hears in those quotations echoes of Freud's statement that the mother is certain, while the father is always uncertain.[20] What is most striking is the diversity of persons expressing the idea that maternity is certain; from

---

[20] "When presently the child comes to know the difference in the parts played by fathers and mothers in their sexual relations, and realizes that *'pater semper incertus est'* while the mother is *'certissima'*, the family romance undergoes a curious curtailment: it contents itself with exalting the child's father, but no longer casts any doubts on his maternal origin, which is regarded as something unalterable" (Freud 1909, 239).

judges to doctors to feminists opposed to and in favor of surrogacy, there appears to be unanimity on this one point. Even among feminists who are quite willing to discuss motherhood as a social institution with a history, there remains a longing to hold onto something that is immutable and knowable: the maternal body, which speaks its certainty through its very visibility. Maternity does not need to be "discovered" or "invented," Pateman seems to be saying. Only paternity must be discovered or invented.

It has always been uncertain paternity that caused anxieties, we have been told. Mary O'Brien (1981) has argued that men's anxiety about their uncertain paternity and their discontinuous relation to reproduction results in their making artificial modes of continuity by creating physical things and appropriating life processes to the extent possible (i.e., eliminating uncertainty about their role as creator). Pateman takes issue with O'Brien's assumption that men try to make paternity socially equivalent to maternity by eliminating uncertainty and argues that patriarchal fatherhood depends on the differing meanings of paternity and maternity (1988, 35). Still, she wants to maintain the distinction between uncertain paternity and certain maternity and to make the claim that maternity reveals its certainty by virtue of women's physical, visible participation in childbirth.

So much intellectual energy is invested by so many in declaring the certainty of motherhood, one begins to suspect that it is uncertainty about the figure of the mother that is

the real anxiety-causer. I would like to explore the idea of certain maternity a bit further and pose a question: Why are we so certain that maternity is certain? (In other words, what cultural work does that certainty do?) Why not consider what it would mean if that certainty were actually culturally produced? I want to argue that for feminists, it may actually be dangerous to draw the theoretical barricades around the uterus. In fact, such a position among feminists may do the very cultural work of the discourse of surrogacy that is very anti-feminist. We might find ourselves on the theoretical side of those who would fix women in the "Pleistocene call of the moon", the "salt in the blood" and "genetic encoding".

Mary Ann Doane has argued that the mother has been coded as certain because she "guarantees, at one level, the possibility of certitude in historical knowledge. Without her, the story of origins vacillates, narrative vacillates. It is as though the association with a body were the only way to stabilize reproduction" (1990, 175, emphasis added). In other words, without the figure of the mother, the subject is unanchored in history and knowledge. According to Doane, reproductive technologies "threaten to put into crisis the very possibility of the question of origins, the Oedipal dilemma and the relation between subjectivity and knowledge that it supports" (169). Doane's observations are supported by a statement in Judge Parslow's opinion in the Johnson v. Calvert case. In defense of his decision that the genetic mother was the only "natural" mother, Judge Parslow said, "We want to know who came before us

and who's coming after. It's a long line, and I see nothing inhumane or inhuman about wanting to have that feeling" (Reporter's Transcript, 22). By explicitly linking genetics and the history of the individual, Parslow is saying that we want certainty about our history, and it is the mother who provides the anchor. Certainty about our genetic lineage is served by finding that genetics is the controlling factor in determining who is the "natural" mother.

Beyond the subject's desire for historical knowledge, feminist theorizing around the certainty of maternity may perform other functions. There is a fear among some feminists that motherhood and the maternal body are the last unique things left for women that men haven't somehow stolen or sullied. In other words, there is a desire to maintain the prediscursive status of the mother so that there remains <u>something</u> that is beyond masculinist representation. Consider the words of Robyn Rowland:

> It is that life force in women which men have always sought to control. How powerful we have always seemed; we who can bleed regularly and not die; we who can grow another human being inside our own bodies.... For many women it is the <u>only</u> experience of power they will ever have. And men have coveted that last of powers.... Now with the possibilities offered by technology they are storming the last bastion and taking control of conception, foetal development, and birth.
>
> ....
>
> We have to ask, if that last power is taken and controlled by men, what role is envisaged for women in the new world? Will women become obsolete? (1989, 363 and 368.)

The fear expressed here seems to be that women will somehow be erased by male reproductive technology and <u>disappear</u>, as noted

by the ominous reference to the Nazi "final solution" in the title of Rowland's article.[21] Once the maternal role is usurped, women will become superfluous. Male-controlled surrogacy, in this view, threatens to annihilate motherhood[22] and in the process, women themselves. Rowland makes this link clearer when she states that the capacity to give birth "is part of the group identity of women" (1992, 13). The political impact of this statement is important to note, because it implies that without the ownership of the capacity to give birth, biologically coded females and thus, women (the social and political group) will disappear. The idea of women losing something that is perceived to bind them together as a group is, of course, a source of anxiety for many feminists.

The issue of power inhering in women's uteruses is not exclusive to feminists who are opposed to surrogacy. Christine Sistare acknowledges that "women have often been manipulated and oppressed because of and through their reproductive capacities"

---

[21]Andrea Dworkin (1983, 188) paints an equally dark future for women in her chapter "The Coming Gynocide," arguing that once men have control over women for both sex and reproduction, there will be a "new kind of holocaust, as unimaginable now as the Nazi one was before it happened".

[22]The term "annihilation" in connection with motherhood is specifically employed by Morgan (1989, 75), who says that various reproductive technologies and practices have led to the "twisted annihilation of the reality of biological motherhood". Morgan worries that the division of motherhood into various parts (ova extraction, <u>in vitro</u> fertilization, the gestation of fetuses by comatose women, etc.) will make live, whole women less preferable than "women who are yet to be born and women who are dead" (<u>Ibid</u>).

(1988, 228), but she sees surrogacy as potentially empowering women. It might be an improvement over many of the boring, unfulfilling jobs available to women, she says and argues that there is quite a measure of self-determination involved in "renting out one's reproductive capacity" (234). Sistare also argues that surrogacy will put a value on women's reproduction in a way that has not been acknowledged previously:

> Consider... how much the traditional panegyrics to Motherhood have really meant: seldom has any human social role been more honored in speeches and less rewarded in fact.... [T]he acceptance and practice of surrogacy would reveal a meaningful respect for maternity. It would do so in the capitalist mode of paying well for what is deemed rare and precious. (238)

Here and elsewhere, Sistare seems to be telling feminists opposed to surrogacy, Look, you complain that women's reproductive capacities are exploited and controlled by men. Why not seize the power and <u>make them pay</u> for that which they desire? It is here that Sistare's argument intersects with those of feminists who oppose surrogacy. She, too, sees women's power located in their wombs. For Sistare and others, something essential and powerful lies in the maternal body and women have to stake a claim to that power. But in doing so, they may unintentionally pave the way for essentialist views that see women as <u>nothing more than</u> their uteruses.

Rowland acknowledges that the power to give birth isn't really much of a power at all in terms of women's access to political power (1992, 265). But by locating at least part of women's identity in their capacity to bear children, she and other feminists leave open the question: what happens when that

capacity is regarded as non-functioning? What happens to the identity of infertile women? Many infertile women express a sense of losing their identity, of feeling like non-women, even non-existent. The identity Woman:Mother (or Potential Mother) is so firmly embedded in our culture that the inability to become a mother in the biological sense threatens some women's very identity as women. As one infertile woman said, "Every morning I measured my temperature before getting up, every day I had the feeling of failing as a woman" (Klein 1989, 13). Another wrote, "[O]ne of the worst times for me was when I felt terrible about myself as a woman. I felt that I wasn't complete. This was not because I hadn't given birth to a baby, but because... I couldn't have a baby" (Ibid, 23).

Some women express this loss of identity as death of the self, as a nonexistence. The metaphor of the barren desert is employed by an infertile woman (speaking of herself in the third person) to express this loss:

> Infertile. She doesn't like the word. It is too smooth, too objective, too much connected with fertility. She prefers the biblical language. Barren. Arid, dry, empty, hollow, void, fruitless, wasted. She is an emptiness, a nothingness, a no one (Ibid, 68).

Another woman uses the striking image of a cemetery in conjunction with barrenness:

> For I am sterile: sterile as a hospital, white, tiled, shining and and clean, smelling of disinfectant. Not a speck of dust, nothing living.... Sterile just like me. Or in plain English: unfruitful. Like a drought-ridden field with thick, cracked clods of earth where nothing grows, nothing flourishes.... Sterility, that is a "cemetery belly", a a woman friend once said to me. A cemetery belly, in

> which countless possible but defunct children, never to be awakened to life, are buried (Ibid, 30).

Focusing on the body and women's capacity to give birth as both a source of power and women's group identity may inadvertently strengthen some infertile women's sense of a lost identity. In fact, relying on a seemingly neutral term such as "capacity" in itself reveals a reliance of the body as "the ultimate constraint on speculation or theorization, the place where the empirical finally and always makes itself felt" (Doane 1990, 163). In other words, if nothing else is real, women can always take comfort in the reality of their capacity to reproduce. But I would argue that it is precisely that theoretically coming to rest on the body that feminists must resist if we are to see and seize the possibilities presented by surrogacy (as well as fight its dangers); if we are to see, in other words, surrogacy through the trope of the cyborg. As Monique Wittig has argued, holding onto the idea that the capacity to give birth is what defines a woman naturalizes history and assumes "that there is a 'natural' division between women and men" and that "'men' and 'women' have always existed and will always exist" (1992, 10-11). If the crucial feminist task of deconstructing and disrupting the code of Woman is to be carried further, we cannot afford to stake our claims on certain motherhood and a body that is theorized as outside of discourse. Recognizing how inextricably linked the construction of the Mother is to the construction of Woman means resisting the urge to rely on the body as the one thing that remains uniquely female and beyond male cultural representation. We

need to think of the cyborg called surrogacy in ways that might lead it to be "exceeding unfaithful" to its origins.

The Changing Shape of Congressional Parties: Ideological Policy Cohesion and Polarization in the U.S. Congress, 1953-1990

Abstract

The literature on the diminished role of party as a voting cue for the electorate and the concomitant growth of the incumbency advantage in congressional elections leads us to expect congressional parties to become less cohesive and polarized over time. An examination of roll call votes during the period 1953-1990, however, does not support the expectation of increasingly irrelevant congressional parties. Party policy cohesion and polarization do not appear to decay; instead they vary with a discernible pattern. Dynamic models, which include factors within the institution of Congress and its external environment, are presented to account for the variation in policy cohesion within parties and polarization between parties. Cohesion and polarization models perform quite well in creating order out of 'patternless' shifts that systematically reflect these various institutional and external factors.

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, Washington D.C., September 2-5.

Although robust, responsible congressional parties are a part of the American political experience, recent electoral changes suggest that the long-term revival of congressional parties is quite unlikely. The diminished role of party as a voting cue within the electorate and the concomitant growth of the incumbency advantage do not bode well for vigorous parties within Congress. Furthermore, characteristics of Congress itself, in particular the lack of discretionary control over some important resources by party leaders, weighs against the development of robust congressional parties.

These various factors lead us to expect that decomposition, not revival, is the lot of congressional parties. The decomposition presumably would reveal itself in two straightforward forms: an increased policy variability within parties and a decreased policy difference between the parties. This study probes these two dimensions of congressional parties in the House of Representatives and the Senate during the period 1953-1990; it discerns more explicitly whether external and institutional factors are indeed associated with weakened internal party organization in Congress.

External Environment And Resource Allocations

We are reminded from time to time that the death of party (and particularly the demise of party identification as a voting cue in the electorate) may not be nearly as imminent as some believe (Cox and McCubbins 1991; Miller 1991). Nonetheless, party-based voting for Congress has diminished while incumbent-based voting has climbed (Cover and Mayhew 1977; Erikson 1971, 1972; Gelman and King 1990; Mayhew 1974; Nie, Verba, Petrocik 1979; Norpoth and Rusk 1982). By the 1970s, three-quarters of all party defections in contested House elections with an incumbent running were defections favoring the

incumbent (Cover 1977). Subsequent work records an even higher imbalance in pro-incumbent versus anti-incumbent defections by partisans (Mann and Wolfinger 1980). This environment makes it difficult for mass parties or parties in government to thrive.

The literature on home styles reinforces the point that incumbents have a large measure of control in shaping their own electoral coalitions and that incumbents have in fact managed to create a large personal vote for themselves (Cain, Ferejohn, and Fiorina 1987; Fenno 1978). Appropriate home styles permit incumbents to undertake a wide variety of activities to contact constituents, to do favors for constituents, and to put themselves in a positive light (Fenno 1978; Fiorina 1989; Mayhew 1974). An additional payoff for incumbents who develop a successful home style is the ability too raise election funds from individuals and PACs (Jacobson 1980, 1983). While parties are hardly irrelevant in the electoral setting, they are not viewed typically as central players either.

A further burden on congressional parties lies in the way in which valuable resources are distributed within Congress. In focusing on the impact that institutional attributes have on congressional parties, the central question concerns the extent to which at any given time resources are centrally controlled. If they are subject to manipulation by the leadership in the chamber, then clearly the members have an incentive to trade their votes (explicitly or implicitly) in exchange for the resources party leaders can provide. The party unity elicited by the post-Civil War "czars" in the House provides an obvious example of a situation in which leaders endowed with ample institutional resources can encourage party unity (e.g., Speaker Cannon). To be sure, this has not been the normal situation in Congress; it has typically had relatively brief periods of centralized control punctuated with

longer periods when resources were relatively dispersed (Dodd 1977; Sinclair 1992).

The overall trend has been toward the proliferation of rules that automatically allocate resources rather than leave decisions in the hands of leaders (Polsby 1968). The development of the seniority system (Polsby, Gallagher, and Rundquist 1969) and the rules governing floor debate (Oleszek 1989) are classic examples of reliance on automatic criteria. Regarding the former, incumbents are not wholly immune from party leaders, especially if they wish assignments on key committees in which the leadership takes a special interest (Rohde and Shepsle 1973). Nonetheless, the opportunities for leadership involvement are rather limited.

The opportunities for the leadership to control the parliamentary situation during floor debates are also relatively infrequent (Oleszek 1989). Although the Senate floor has traditionally been easier to seize than the House floor, Senate leadership discretion on recognizing members and entertaining motions is much weaker than it has been in the past. In discussing the prevalence of automatic as opposed to discretionary decision-making in the Congress, we might also note the potentially important question of appointing the members of conference committees is a matter largely taken out of leadership control (Oleszek 1989). The widespread expectation that those from the committee and subcommittees responsible for legislation should be appointed conferees and the expectation that a cross-section of members, not just senior members, should be considered, significantly constrains the choices open to leaders who formally hold the power of appointing conferees.

The prevalence of non-discretionary resource allocations extends beyond the bounds of Congress itself to encompass resources with more obvious electoral aspects. Automatic

criteria govern the distribution of office perquisites such as staff, supplies, and such, thus reducing the reliance of incumbents on political parties and leaders as they pursue their official/electoral activities. Incumbents who perform casework on behalf of constituents (Serra and Cover 1992), mail "baby books" to new parents (Cover and Brumberg 1982), and travel back to their districts (Parker 1980) frequently derive (or at least attempt to derive) electoral benefits without having to curry favor with those controlling the distribution of the many perquisites available to incumbents. In a sense then, we have come full circle with the internal attributes of the institution influencing the electoral environment which, in turn, helps shape the institution itself.

Trends in Party Policy Cohesion and Polarization

The lack of an institutional or electoral basis that would encourage representatives and senators to co-operate with congressional parties and leaders creates a severe handicap for the development of robust parties. Without control over internal or external resources valued by their members, party leaders must rely on the willingness of members to support party positions on legislation (Fiorina 1989; Schattschneider 1960). This is turn depends upon the extent to which the policy interests and goals of individual members coincide with those of the party as a whole and the party leadership acting to further general goals (Kingdon 1989; Parker 1989). As a result the potential for parties to generate dependable coalitions for collective action remains quite problematical (Brady, Cooper, and Hurley 1979; Decard and Stanley 1974; Sinclair 1977).

To be sure, party is still the best single predictor of voting behavior in the Congress (Epstein 1986; Matthews 1960; Marwell 1967; Truman 1959; Turner 1951, Turner and

Schneier 1970), but this is in a context in which members display considerable policy independence (Kingdon 1989). From the perceptive of their individual interests, they are largely policy entrepreneurs who may occasionally find it useful to accommodate their interests to those of the party, but in general will find the party a rather weak constraint on their voting decisions.

Given all this, the previous literature leads us to expect member independence to be on the rise, and we expect to see this manifested in two obvious ways. First, we would expect to find *less* policy cohesion within parties over time as members build locally appealing policy positions. It is not so much that we expect members to reject party positions and leaders as it is that we anticipate they will find the party as an increasingly irrelevant factor of interest to them and to their constituents. Second, we would expect a *convergence* of the parties as members lay aside party considerations in their quest for votes. To some degree, of course, we would expect differences between the parties to remain if for no other reason than that districts that send Republicans to Congress are by and large different from districts that send Democrats (Davidson and Oleszek 1981). Nonetheless, the polarization of the parties should decline if demographics alone remain as the underpinning for Republicans and Democrats to vote differently.

Congressional party policy cohesion and polarization can be gauged by a number of roll call measures; an appropriate one has been created by the Americans for Democratic Action (ADA). This interest group is one of the many groups that closely observe congressional voting and publish ratings of members of Congress each year. ADA ratings offer a good summary measure of the representatives' support for liberal policies on a wide

range of issues and allow us to examine intrinsic policy differences or distance between legislators. Policy ratings represent the number of "correct" votes, that is, the number of times a legislator voted with the stated positions of the group divided by the total number of salient group issues. ADA ratings are highly correlated with rankings issued by the Americans for Constitutional Action (ACA) and Conservative Coalition (CC) support scores (Poole and Rosenthal 1985; Kau and Rubin 1982). Thus, to simplify the analyses, we can focus exclusively on ADA scores.

Contrary to the expectations of decreased policy cohesion within parties and polarization between parties, an inspection of House and Senate roll votes during the period 1953 through 1990 reveals no obvious trend over time in the ideological cohesion within each party (see Table 1) or the polarization between parties (see Table 2).[1] These results are also graphically represented in Figure 1 (House cohesion), Figure 2 (Senate cohesion), Figure 3 (House polarization) and Figure 4 (Senate polarization). Results indicate, as we would expect, Democrats are consistently less cohesive than Republicans; this reflects the recurring regional split within the Democratic party (for a discussion of changing factionalism within the Democratic party see Rohde 1991). Additionally, Table 2 indicates that party policy polarization in the House and Senate are similar in the 1950s, but House polarization subsequently remains higher than in the Senate.

The data suggest that shifts in House and Senate party policy cohesion and polarization are rather similar but by no means identical. Calculated Pearson correlation coefficients reinforce these impressions. The correlation coefficient between Republican mean ADA scores in the House and the Senate is 0.345 ($p < .04$); the correlation coefficients

between Democratic mean ADA scores in the House and the Senate is 0.558 ($p < .001$); the correlation coefficient for the level of policy conflict between the parties in both chambers is 0.516 ($p < .001$). These correlations coupled with the findings above suggest that similar forces are affecting policy cohesion within parties and polarization between parties in each chamber. Differences between House and Senate scores may be the result of institutional differences between the chambers as well as measurement error, i.e., ADA scores for each house are based on different sets of bills.

Explanation For Party Policy Cohesion And Polarization Shifts in Congress

What then, accounts for the apparently patternless shifts of party policy cohesion and polarization over this time period? To answer this question, we examine the institutional environment and external environment of Congress; shifts in policy cohesion within parties and polarization between parties are likely the result of various combinations of forces that are part of the institutional environment in each chamber as well as the external environment.

Institutional Environment

Presumably, one of the most important institutional influences on party policy cohesion and polarization in the Congress is party leadership. The political skills and abilities of party leaders are potentially critical factors affecting party organization (Polsby 1986). We must first look to the party leadership as a determinant of policy cohesion within parties and polarization between parties. The drift of reforms in this century has been to weaken the ability of party leaders to ride roughshod over the opposition both within and outside their parties. Note, however, that there has been a countervailing strain toward

more active leadership in recent years (for a general discussion on cycles of centralized versus decentralized leadership see Dodd 1977; on the subject of revived party leadership see Sinclair 1992). Accordingly, one would expect a significant difference in the leadership styles among the most notable leaders of the House (e.g., Speakers Cannon, Reed, Rayburn, and O'Neill) and the Senate (e.g., Johnson and Baker), but more importantly for our purposes a difference in leadership success. Strong leaders are still possible in an era of individualistic members.

To the extent that congressional parties have sufficient common preferences on issues, party leaders act as agents in pursuing their party's legislative agenda (Clausen 1973; Kingdon 1989; Matthews and Stimson 1975; Norpoth 1976; Rohde 1991; Shaffer 1982). This perspective acknowledges that "such leaders do not command or control the mass of the membership (although they may seek to do so to marginal individuals who can make the difference between winning and losing)," but use authority delegated to them by members to accomplish common goals (Rohde 1991: 35). Members of Congress "sacrifice a limited amount of their independence to the leaders, because the commonality of preferences ensures that most members would only rarely be pressured to take an action they do not prefer" (Rohde 1991: 35).

Following this line of thought, the strength of the party leadership as a voting cue rests with its ability to provide fairly clear and unified signals to rank and file members on party agenda votes. No doubt, "the party leadership will vary in the degree to which it is united and in the degree to which it communicates its united intent to its followers" (Cox and McCubbins 1991: 553). Thus, it seems intuitive to expect differences in the ability of

the House and the Senate leadership to unify the party and in the degree of polarization they (implicitly or explicitly) encourage.

Two other institutional factors that are likely to affect party policy cohesion and polarization are the percent of new members in the Congress and the number of recorded votes in the chamber. The first factor - percent of new members in the House and Senate - taps the relationship between voting behavior and elections. Research on congressional voting suggests that freshmen legislators vote the party line more often than their senior counterparts (Truman 1959; Weinbaum and Judd 1970). As compared to more senior legislators, freshmen rely more heavily on party because they are not yet socialized to such cues as state delegations and committees (Weinbaum and Judd 1970). Additionally, previous work suggests a connection between new members, partisan voting, and policy changes (Brady, Cooper, and Hurley 1979; Brady and Naomi 1973). Hence, we should expect a positive relationship between the percent of new members in each chamber and policy cohesion within parties and policy polarization between parties.

The second factor - number of recorded votes - taps the relationship between voting behavior and decision heuristics. Procedural reforms (especially in the House - see Oleszek 1989) and a decentralization of power in the House and Senate have expanded the opportunity for recorded votes; additionally, pressure for such votes by interest groups and other actors anxious for members to be put on record have increased the drift toward recorded votes over time (Orstein, Mann, and Malbin 1990, 1992). Thus, given the time constraints on representatives' decisions and the possibility of input overload (Kingdon 1989), legislators will find it necessary to utilize short cuts in voting decisions. Party cues

are readily at hand as the decisional burden from recorded voting increases.

Differences in the margin of seats between the majority party and the minority party in the House and Senate may have an impact on party policy cohesion and polarization. Party leaders may be more willing to permit members to stray from party positions when the party holds a considerable majority of the seats in the chamber. On the other hand, if the margin of seats between the parties diminishes, factors such as party leadership and party competitiveness may act as a catalyst to increase party policy cohesion and polarization.

Finally, the degree of partisan conflict in the chamber (i.e., party policy polarization) is likely to affect the degree of party policy cohesion. Partisan conflict taps the "degree of ideological conflict between the parties as electoral coalitions"; thus the greater the difference between the parties, the greater the level of policy cohesion within parties (Brady, Cooper, and Hurley 1979: 338). As congressional parties become more polarized on salient legislative issues, party leadership may be less understanding toward members straying from the party fold.

External Environment

The preceding analysis suggests that institutional factors may affect policy cohesion within parties and polarization between parties in Congress. This analysis is clearly incomplete, however, in that it has yet to examine factors that are external to the House and Senate, which may affect party policy cohesion and polarization.

Two important external factors are whether the president and the chamber majority are of the same party and presidential administration. The first factor - correspondence

between the president's party and that of the chamber majority - may have an impact on party policy cohesion and polarization. When the president and the majority in the House or Senate share the same party affiliation, party policy cohesion and polarization in the chamber is likely to rise (Brady, Cooper, and Hurley 1979). Presidents in general attempt to set a legislative agenda for the majority party, and with the backing of the administration, the majority leadership can mount pressure on members to lend their support and thus unify the party (Davidson and Oleszek 1981; Brady, Cooper, and Hurley 1979; Polsby 1986). In addition, the opposition party may unite against the president and thus contribute to higher levels of cohesion within parties and polarization between the parties. The current budget votes in Congress succinctly illustrate the point; the Democrats lusted to have their President succeed and the Republicans unified in opposition.

The second factor - presidential administration - taps the impact of the ideological preferences of presidents on party policy cohesion and polarization. Revisions in the rules by which political parties nominate presidential candidates have strengthened the role of splinter groups within parties and increased the necessity for ideological appeals by presidential nominees (Polsby 1983, 1986). The net effect of nomination changes was to undermine the role of party leaders (including members of the House and Senate) and "to increase the probability that presidential nominees would be more doctrinaire," that is, either more liberal or conservative than the overall party membership (Polsby 1986: 193).

Hence, a president emerging from the party nomination system whose ideological preference is out of phase with his party, is less likely to spur party policy cohesion than is a president closer to his party's ideological preference. The expectation that cohesion within

the inparty should produce cohesion within the outparty suggests that both parties would be more cohesive the closer the president is to his party's center; we would expect polarization to increase as the president's ideological preferences approach the mean of his party.

Another factor in the external environment that may affect congressional parties is the general level of partisanship in the electorate. The more partisan the environment in which congressional parties operate the more likely they are to act in a partisan fashion. Hence, as the proportion of Independents in the electorate increases, congressional parties should become less cohesive and less polarized (Downs 1957; Enelow, and Hinich 1984).

Finally, the health of the national economy is likely to affect the polarization between the parties. One indicator of economic well-being is the unemployment rate (Tufte 1978). The ideology and platform of the Republican party and the Democratic party differ on macroeconomic policy. The Republican party typically favors trading greater unemployment for less inflation. In contrast, the Democratic party will accept increased rates of inflation in order to reduce unemployment. Such differences between the parties on unemployment policy contributes to greater party policy polarization in Congress. Polarization is presumably a function of the extremity of unemployment; when unemployment is a salient pocketbook issue, the Democrats are likely to be spurred into action and Republicans are likely to resist (see Bibby 1992: 247).

Legislative Policymaking: Strategy and Method

The strategy for analyses is two fold. First, we will model the effects of the institutional variables (I) and external variables (E) along with a stochastic error term on

Democratic and Republican party policy cohesion in each chamber. In more formal terms:

$$Y_{cohesion} = B_0 + B_I + B_E + error.$$

Second, we will model the impact of a similar set of institutional and external variables, including a measure of unemployment on party policy polarization.

Institutional Variables

Among the institutional variables, PARTY LEADERSHIP STRENGTH is measured as the proportion of times legislators of the same party voted with their floor leader and chief whip on party agenda votes in a given year. A party agenda vote is defined as a roll call in which the party leadership of one party - the floor leader and the chief whip - vote on the same side and in which the party leadership of the other party do not also vote on this side (Cox and McCubbins 1991: 547-570). Note that the cohesion and polarization models will have different leadership measures. The leadership measure in the cohesion model will be party specific (i.e., the proportion of times legislators of the same party vote with their leadership). In the polarization model, the leadership variable will measure a more general level of leadership strength regardless of party (i.e., the proportion of times Republicans and Democrats collectively voted with their party's leadership on party agenda votes).

The variable, PERCENT NEW MEMBERS in the chamber for the cohesion model is measured as the percentage of chamber freshmen in each party. In the polarization model, this variable is measured as the overall percentage of freshmen in the chamber. The institutional variable, RECORDED VOTES, is measured simply as the number of recorded floor votes in each session of the House and Senate.

The variable reflecting differences in the margin of seats between the majority party and the minority party (MARGIN) is measured as the absolute difference between the number of seats held by the Democratic party and those held by the Republican party in each chamber. Finally, PARTY POLICY POLARIZATION is included in the cohesion model to tap the impact of the degree of ideological conflict between the parties; it is measured as the difference between the mean party ADA scores.

External Variables

Turning next to the external variables, the ideological preferences of presidents is measured by a straightforward method suggested by Mark Zupan (1992: 351-361). By matching the ADA position on selected issues with roll call votes on which, according to Congressional Quarterly, the president took a stand, an annual ADA rating for U.S. presidents over the period 1953-1990 can be developed. In the polarization model, this variable (PRESIDENTIAL ADMINISTRATION) is measured as the absolute value of the difference between a president's ADA score and the mean ADA score of his party; this measure is *aggregated* for each presidential administration by year.

In the cohesion model, we examine presidential ideological preferences somewhat differently; we utilize a *set* of presidential administration variables. For example, in the model estimating the effects of presidential administration on Democratic cohesion, the absolute differences between individual Democratic presidents (KENNEDY, JOHNSON, and CARTER) and the mean ADA score of their party, relative to the time period, are included in the model. A measure for the impact of presidential administrations of the opposite party (e.g., Republicans) is the aggregated measure of the difference between the

ADA scores of Republican presidents and the mean ADA scores of their party. This variable (OPPOSING PRESIDENTIAL ADMINISTRATION) is also included in the model.

It is important to note that due to collinearity problems in the cohesion equation, we were unable to include the dichotomous measure of presidential-chamber congruence discussed earlier. Fortuitously, chamber-presidential congruence is related to the set of presidential administration variables included in the cohesion model. Because the presidential administration variables are measured for each individual president of the party relevant to a given model and all opposing presidents, it taps much of what we sought to measure with congruence.

In the polarization model, the congruence between the president's party and the chamber majority is measured as a simple dichotomous variable (CONGRUENCE). When the president's party and the chamber majority are the same, the variable has a value of 1; when they are different, the variable has a value of 0.

The external variable, percent of Independents in the electorate (PERCENT OF INDEPENDENTS), is measured by aggregating responses to the party identification question in the Survey Research Center National Election Studies. All Independent categories - Independents, Independent Republicans, Independent Democrats - are added together to create a variable consisting of the percentage of Independents in the electorate. Finally, the variable - unemployment rate (UNEMPLOYMENT RATE) - is measured by the annual unemployment rate reported by the Department of Labor.

Estimation Technique

Ordinary Least Squares (OLS) is not an appropriate estimation technique. Time-series data often violate the basic assumptions of the OLS model (Gujarati 1988; Judge et al. 1980). As with most time-series data, there are theoretical reasons here to suspect that resulting error terms are likely to be related to previous observations; error terms are related from one year to the next (AR1) and, every two years (AR2), especially in the House electoral cycle. Consequently, the expected values of the error terms are not independent. While parameter estimates remain unbiased, they are less likely to be efficient.

Various methods allow us to detect autocorrelation and correct for its effects. When dealing with dynamic models, "it may be superior simply not to test for serial correlation, but instead to proceed as if it were present" and apply corrective measures (Hanushek and Jackson 1977: 174). The unconditional least squares (UCLS) method, which is used to generate the results below, is an appropriate estimation technique[2]. This technique specifies and controls for autocorrelated error terms.

Results and Discussion

Party Policy Cohesion

Results from the party policy cohesion model are listed in Table 3 and Table 4.[3] Among the institutional variables, party leadership strength is significant and in the predicted direction for both parties in the House, but only for Senate Democrats. These findings lend support to the hypothesis that when the party leaders are united and clearly communicate their united intent to rank and file members, strong leadership is still possible,

even in an era of individualistic members.

The variable measuring percent new freshman provides conflicting support for our hypothesis. Among Senate Republicans, electoral turnover (i.e., greater percentages of new members) increases party policy cohesion. Conversely, electoral turnover among House Democrats decreases party policy cohesion. Taken together these findings might suggest that new House Democrats appear to be more closely tied to their districts than Senate Republicans.

For House Democrats and Senate Republicans the coefficient for recorded votes is significant and in the predicted direction. Given a more frantic pace of voting, party becomes a more important decision heuristic. The variable measuring the margin of seats between the majority party and the minority party in the chamber is negative and significant for House and Senate Republicans. This provides support for the hypothesis that the smaller the difference in the margin of seats between the parties, the greater party policy cohesion - at least for Republicans. The Democrats in the House and Senate seem less concerned with the level of competition than are Republicans, which seems intuitive since Democrats have generally enjoyed majority status in Congress.

Finally, the variable measuring partisan conflict or polarization between the parties (i.e., the difference between mean ADA scores for Democrats and Republicans) is significant and in the predicted direction in every case. Higher levels of partisan conflict increases policy cohesion within parties.

Turning to the external variables, House and Senate Democrats appear to pay little attention to presidents of their own party with respect to their own cohesiveness. However,

House Democrats tend to become more cohesive as Republican presidents differ more from the mean ADA of House Republicans. On the other side of the aisle, House and Senate Republicans are affected by Republican presidents, but the effect is chamber specific; Senate Republicans became *less* ideologically cohesive as Nixon, Ford, and Reagan departed from the mean ADA score for Senate Republicans. These findings are consistent with our hypothesis. House Republicans, however, grew *more* cohesive as Ford departed from the mean ADA score for House Republicans; this positive substantive linkage is unexpected. Since this relationship is isolated to the short tenure of the Ford administration, one plausible explanation is that House Republicans, facing eminent elections, may have moved to assert their independence from the Administration in the wake of Watergate and the Nixon pardon.

Finally, policy cohesion among congressional Democrats is more sensitive to levels of partisanship in the electorate than is cohesion among Republicans, whose cohesion does not respond as much to changes in the environment. Furthermore, there is a difference between House and Senate Democrats. The coefficient for the percent of Independents in the electorate is negative and significant for House Democrats; the coefficient for the level of Independents is positive and significant for Senate Democrats. The former is consistent with the hypothesized relationship between the level of Independents in the general electorate and policy cohesion; the more diverse the electorate (i.e., more Independents), the less incentive House Democrats have to behave cohesively. The latter relationship is inconsistent with the hypothesis and is likely to be a spurious one, reflecting relatively high Senate Democratic cohesion in a period of rising Independents (i.e., increased cohesion over

time tracks general increases in the proportion of Independents in the electorate). The positive substantive linkage that the coefficient indicates is unexpected.

Policy Polarization

Results from the policy polarization model are presented in Table 5. Turning first to the institutional variables, party leadership strength is again significant and in the predicted direction for both parties and in each chamber. Clear and unified signals from the party leadership on party agenda votes are associated with greater differences between the parties.

The coefficient for the variable measuring electoral turnover is negative and significant for the Senate; the more new members in the chamber, the less policy polarization between parties. These relationships are opposite those hypothesized, yet consistent with those reported in the policy cohesion model.

The margin of seats between the majority and minority party in the House and Senate has an impact on party polarization in the latter; the greater the margin of seats in the Senate, the greater the polarization between the parties. One plausible reason that the margin of seats does not play a larger role in the House is that the Democratic party has enjoyed a more comfortable seat margin in the House compared to the Senate.

Turning next to the external variables, the difference between the ADA score for the president and the mean ADA score of his party is negative and significant for the Senate. When compared to their House counterparts, senators are less isolated from ideological evaluations (Abramowitz and Segal 1992; Kuklinski and West 1981), and would, therefore, be more sensitive to shifts in presidential ideological preferences. Ideologically extreme

presidents reduce the level of party policy polarization in the Senate, and as a result allow members to position themselves as more moderate.

The coefficient for the percent of Independents in the electorate is positive and significant for the Senate; as noted earlier, this relationship is likely to be spurious. This result is consistent with the finding for Senate Democrats in the party policy cohesion model.

Finally, policy polarization between parties in the House and Senate is indeed a function of the extremity of unemployment. As unemployment increases and becomes a salient issue, differences in remedial measures between the parties drives them further apart.

Conclusion

At the beginning of this paper, we discussed the diminished role of congressional parties that one would expect given the reduced role of partisanship in the electorate and, in recent years, the increased role of incumbency as a voting cue in congressional elections. These broad patterns led us to sketch a scenario in which congressional parties should have become less cohesive and less polarized over time. A straightforward examination of the data, however, does not support the expectation of the increasingly irrelevant congressional parties. They have, rather remarkably, at least maintained their role in relatively difficult circumstances.

Further, we would argue that the lack of a broad pattern of congressional change does not mean that changes in party policy cohesion and polarization in Congress are altogether lacking structure. A variety of both institutional and external factors have been at work affecting parties in Congress. The models presented in this paper permit us to

begin disentangling the apparently patternless shifts of party policy cohesion and polarization over time. Clearly the factors influencing cohesion and polarization are quite complex, but even at this point we can discern some broad patterns.

The most important point to emphasize is the potentially powerful role played by party leadership in shaping both cohesion and polarization. The key role of leaders did not vanish with the Czars of old; leaders are still central to understanding party policy cohesion and polarization. This finding meshes nicely with the argument by Cox and McCubbins (1991) stressing that many previous studies may have inadvertently underestimated the impact of party leadership and other measures of organizational strength.

Shifting our focus to the various models developed to explain cohesion and polarization, a few general points should be emphasized amidst the welter of coefficients. First, the models are very successful in explaining the variation in cohesion and polarization. For the former, the explained variance always exceeds sixty percent, (House Republicans) and runs up to nearly ninety percent in the best case (House Democrats). In general, as far as cohesion is concerned, Democrats are easier to explain than are Republicans. Across the board, for Republicans and Democrats in both chambers, the extent of party polarization has a significant impact on the degree of party cohesion. With respect to polarization, the model is also quite successful, explaining about seventy percent and sixty percent of the variance for both the House and Senate respectively. Interestingly, the House model is marginally more successful in this regard even though the Senate model is superior in terms of the number of individual factors that are significant and in the predicted direction. Overall, the cohesion and polarization models perform quite well in creating order out of

'patternless' shifts. They do not represent the end of the story but, we feel, a quite solid beginning.

Endnotes

1. Ideological cohesion within parties for each chamber is measured here as one over the standard deviation of mean party ADA scores within each year. This measure is consistent with the conceptual notion of policy cohesion within the literature (i.e., larger ADA values indicate greater ideological cohesion). Ideological polarization is measured as the policy difference or distance between mean party ADA scores for each chamber (see Poole and Rosenthal 1985).

2. Due to the concern for small sample properties of various methods of time-series analyses, several methods, including the Yule-Walker method and maximum likelihood method, were examined to test the reliability of our results (Harvey 1981; Judge et. al. 1980). The results of these models produced very similar coefficients and significance levels.

3. While many of the coefficients for the party policy cohesion model appear to be rather small, they are best interpreted in the context of the scale measuring cohesion (see Table 1 for means and standard deviations of cohesion values). For example, holding all other factors constant a 10 percent increase in the scale measuring leadership strength for House Democrats is associated with nearly a 20 percent increase in cohesion - a difference of 3.36 ADA points.

SOUTHERN GRASSROOTS PARTY ACTIVISTS:

MOTIVATIONAL INCENTIVES AND STYLISTIC ORIENTATIONS

Stephen D. Shaffer

David A. Breaux

Mississippi State University

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton,

September 2-5, 1993.

A time-honored concern of scholars of political parties has been what motivates people to support the party organization and its candidates. One branch of this research tradition has focused on whether people become active in organizations to acquire material benefits, enjoy social and interpersonal relations, or to shape public policy, as well as whether party workers' motivations change over time in response to their environment or maturation. Another branch has examined party members' motivations in supporting political candidates, and whether they are primarily concerned with backing an electable candidate or one who mirrors their own ideological views. Our paper shall combine both of these avenues pertaining to party workers' motivations, using a random sample of county chairs and county committee members in the contemporary South.

The South is a particularly intriguing region to focus on, given the significant partisan realignment that has been transforming the region from a one-party Democratic bastion into a competitive two-party system (Swansbrough and Brodsky, 1988; Lamis, 1990). Especially in presidential elections, voters in recent decades have clearly responded to the events, issues, and candidates who have contested the races, rather than relied solely on a partisan tradition grounded in the institutions of racial segregation and civil war. While such developments may suggest a prominent role for ideologically-motivated party activists in the South, others have pointed out that such political transformations as ideological realignment in the Congress and party sorting at the grassroots levels have resulted in southern political orientations that resemble national patterns (Steed, Moreland, and Baker, 1990).

LITERATURE REVIEW

Motivational Incentives for Activism

For three decades, researchers have generally classified party workers' motivations for becoming and remaining active in party organizations into three categories (quotations are from Clark and Wilson, 1961). Material incentives are tangible rewards that "have a monetary value or can easily be translated into ones that have." Workers' dependency on such tangible rewards minimizes conflict within the organization and provides for highly flexible tactics and activities. Solidary incentives are basically intangible, have no monetary value, and are divorced from the ends of association, but instead derive from the act of associating. Clark and Wilson consider "socializing, congeniality, the sense of group membership and identification, the status resulting from membership, fun and conviviality, [and] the maintenance of social distinctions" as solidary incentives. Purposive incentives are intangible, "derive in the main from the stated ends of the association," and are based in the overall goals of the organization such as its demands for enactment of various public policies.

Clark and Wilson (1961) point out that the incentives relied on by an organization such as a political party can change because of changes in the environment or in the membership's motivations. Hence, limited access to material rewards and limited success with purposive goals may lead the organization's leaders to stress the solidary benefits of group membership, though such shifts in incentives threaten a possible exodus by those induced to join the organization for other reasons. Clark and Wilson suggest that motivational incentives may operate independently of stylistic orientations

toward politics. They point out that solidary groups may adopt a democratic style oriented towards issues to attract middle-class, college-educated members, or a political machine "clubhouse politics" orientation that excludes various non-traditional groups. As monetary incentives have become less available or important to party workers, many organizations are being staffed by amateurs "impelled by the enjoyment of politics or by the good purposes" of the party.

In a comparative case study of precinct chairs in two counties in Illinois and Maryland, Conway and Feigert (1968) found that "impersonal" motivations such as civic duty and a desire to influence government policy were most frequently cited as motivations for becoming politically active as well as for seeking the precinct chair position. However, motivations changed over the years with social contacts and "other personal satisfactions" such as material goals being cited as most likely to be missed if precinct leaders resigned their positions. This "evolution away from purposive motivations" was especially evident in the more affluent county, where such motivations for initial activity were especially strong. Conway and Feigert also found that majority party activists showed greater current satisfaction with purposive incentives compared to the minority party. Relating reason for accepting precinct post to type of group support, they also concluded that those motivated by a sense of civic duty were "somewhat less likely to report the influence of party faction than those... seeking the post for other reasons."

In an analysis of grassroots party officials (precinct or ward chairs) in five communities in North Carolina and Massachusetts, Bowman, Ippolito, and Donaldson (1969) found that officials most liked the personal satisfactions and rewards of their jobs, and most disliked any conflicts within the organization. When asked why they were involved in politics, party officials cited purposive

incentives as most important, followed by solidary reasons, with material incentives rated as least important. Suggesting that material incentives were largely unavailable in the modern party organization and that purposive goals were difficult to achieve, the authors speculated that activists planning to continue in their party posts were socialized to accept solidary incentives. In addition to being more likely than anticipated quitters to characterize their party position as "personally important," officials planning to remain in office were more likely to cite a strong sense of party loyalty as a very important reason for being politically active. For the first time, candidates also appeared to play some role in sustaining activity, as quitters were more likely to cite personal friendship with one or more candidates as a very important incentive, suggesting a sporadic pattern of activity on the part of some activists inspired by a favorite candidate to become politically active, but who then opt out of the organization after their favorite leaves the political scene.

Dennis Ippolito' examination of county executive committeemen in Nassau County, New York classified incentives for activism into personal and impersonal groupings with the former generally including material and solidary reasons and the latter purposive incentives. He found that activists were amateur-oriented in the sense of being primarily motivated by impersonal incentives, and that when comparing their responses on separate questions asking why they had "become involved in party work" and why they were "doing party work now" their motivations tended to stay the same. Ippolito speculated that organizational level may have contributed to stability in purposive incentives for activism--high level county officials may have been better able to shape the incentives that the organization provided than were lower-level activists. As in most studies of incentives for activism, some validity concerns arise over the

classification of separate incentives into broader categories. Ippolito classifies party attachment as an impersonal or purposive incentive, while Clark and Wilson conceptually define it as a solidary motive.

Returning to precinct chairs in two counties in Illinois and Maryland, Conway and Feigert (1974) moved beyond the literature's customary focus on incentives alone and examined their relevance for party activities and communication patterns within the organization. They found that the socio-political environment interacted with and conditioned the relationship between sustaining motivations and activities, as those having purposive motivations appeared to pursue their goals in different ways depending on the environment. Among a higher socioeconomic status population having a higher turnout, activists motivated by purposive incentives stressed communicating principles as their most important party task, while in a lower socioeconomic status environment such activists asserted the primacy of generating voting turnout. The difficulty of obtaining policy goals in actuality through party work may help account for activists motivated by purposive incentives being more likely than other activists to report devoting no time to party work in non-election times and expecting to devote less time in the future to party work in general, but a contrary finding was a reported greater number of organizational activities performed during election times by purposively-motivated activists. Regarding intra-party communications, activists motivated by material incentives were most likely to report frequent meetings with state party leaders, though patterns were less clear for communications with county and other precinct party leaders.

Moving to the national level of the parties, Roback (1980) examined initial and continuing motives among delegates to the 1972 and 1976 national Republican conventions. When asked "who was most responsible for getting you interested in

politics," Reagan delegates were more likely to cite issues and events and claim that they were self-recruited, while Ford and Nixon delegates cited "more traditional patterns" of activism such as their family. Motivating reasons for why one first became active in the party appeared to be shaped by the interaction of agent of recruitment (external agent or self-recruited) and candidate supported in 1976. Among externally recruited delegates, solidary and material incentives tended to predict support for Ford rather than Reagan, while among self-recruited activists, purposive incentives (as well as a candidate's campaign) tended to predict support for Reagan. Purposive incentives were rated as most important for remaining active in the organization by all three candidate groupings, while material incentives were regarded as least important. Purposive reasons were most important to Reagan supporters, while solidary and material incentives were relatively more important among Nixon and Ford partisans. Estimating motivational continuity over time was problematic given different lists of items used to determine initial and sustaining incentives, but Reagan delegates did appear to exhibit greater purposive continuity than did other delegates.

Examining 22 state party conventions in 1980, Abramowitz, McGlennon, and Rapoport's (1983) factor analysis of why delegates became actively involved in the presidential campaign produced a personal benefits dimension that included material and solidary reasons and a purposive dimension of issues and candidates, with party loyalty and civic duty items failing to scale on either factor. Purposive incentives were rated most important by both party's delegates, but the party loyalty item was a close second. Arguing that delegates are motivated by partisanship as well as purposive goals, the authors find that party identification intensity and organizational activity measures (years active in

party, regularity of campaign involvement, organizational and electoral experience) are correlated with the purposive motivational scale as well as the partisan motivation indicator, though in each instance they are more highly correlated with the partisan indicator. The persisting importance of party loyalty was also reflected in a situation of cross-pressure, as intensely partisan motivations reduced support for Kennedy among very liberal delegates as well as those most motivated by purposive incentives. However, ideological self-identification continued to remain a more important predictor of candidate support than partisan intensity (or magnitude of purposive motivations).

Hedges (1984) extends the motivational analysis to a new group of activists--campaign contributors-- by focusing on those who contributed at least $100 to the 1972 presidential candidates. Contributors rated purposive motivations of influencing policy, community obligation, and affecting elections as most important incentives, while material incentives such as business contacts were of little importance. McGovern contributors were even more likely to be motivated by purposive incentives than were Nixon supporters. Hedges finds considerable motivational stability, reflected in high correlations in the importance of each incentive as an initial and current reason for being active in politics. While his factor analysis produces the standard three incentives, further analysis permits subdivision of the solidary dimension into a "specific solidary" subgroup that includes the politics as a way of life and party attachment items.

Miller, Jewell, and Sigelman (1987) extend the motivational analysis to campaign workers, focusing on the 1979 and 1983 Kentucky Democratic gubernatorial primary campaigns. The overriding incentive in the primary campaign was a candidate motivation--"to support a particular candidate I believe in".

Regarding the three motivational types, purposive incentives were most important while material incentives were least important. The authors found considerable continuity in each of the three motivational scales between the two election years, though as in most of these studies the previous years' reports constitute recall data. Finally, purposive, solidary, and material scale scores were largely unrelated to each other, suggesting empirically as well as conceptually separate motivational dimensions.

Stylistic Orientation towards Politics

A related though distinct tradition has been activists' stylistic orientation towards politics, whose central focus has been on how people behave rather than on whether they will participate at all. "Professionals" are generally regarded as being willing to compromise their principles in order to maintain party unity and win the general election. "Amateurs" or "purists" are generally viewed as being more committed to internal party democracy, maximizing popular participation in the organization, and substantial policy goals instead of electoral victory.

Soule and Clarke's (1970) classic study of the 1968 Democratic convention found that amateurs tended to be younger than professionals and were more likely to have initially become interested in politics because of events or their adult peer group, while professionals were socialized more by their family. Professionals had been active in the party longer than amateurs, had attended more national conventions, were more likely to be appointive rather than elected delegates, and felt more responsible to the local party organization (rather than state or national). However, these patterns may have been affected by the

amateur-professional scale itself, which included an item on whether people worked for the party "year after year" or "only when there is a particularly worthwhile candidate or issue." Since the key differences between amateurs and professionals were procedural and stylistic, the two groups of delegates did not significantly differ on policy or ideological lines. Yet stylistic orientation along with ideological self-identification did make an independent contribution to candidate preference, as liberal amateurs were most supportive of dovish Eugene McCarthy, while conservative professionals were most favorable to Vice President Hubert Humphrey.

In a replication of this study for the 1972 Democratic convention, Soule and McGrath (1975) found a significant increase in the presence of amateurs, part of which may be attributed to the increased numbers of women and those under 30 years of age, groups more likely to be amateurs than men and older delegates. This trend was counteracted by the increased numbers of blacks, a group more likely than whites to be professionals. Since women and the young were also more politically liberal than men and the elderly, their increased presence may also help account for the increased liberalism of the 1972 convention. Once again both stylistic orientation as well as ideology were related to candidate preference, as liberal amateurs tended to favor McGovern, conservative amateurs backed Wallace, and conservative professionals tended to favor Humphrey and Henry Jackson.

Roback (1975) extended the amateur-professionalism investigation to the Republican party by examining the 1972 Republican convention. While demographic traits were only weakly related to stylistic orientation, like the Democrats women and young adults were more likely than other groups to be amateurs, though unlike the Democratic pattern higher rather than lower income delegates were more

likely to be professionals. Agents of initial interest in politics tended to be the family for professionals and events and experiences for amateurs. Amateurs were more likely to be self-recruited than professionals, who were more likely to have been asked to initially become active in the party by a party official or member. Compared to amateurs, professionals had been active a longer time in the party, had attended more conventions, were appointed as delegates rather than elected, and felt more responsible to the state delegation leader or President Nixon rather than to the people in the district or state. Professionals rated material and solidary incentives as more important than amateurs and purposive incentives as less important reasons for remaining active in the party, though no apparent validity tests were performed on the assignments of specific incentive items to each scale. Issue preferences and ideology are largely unrelated to stylistic orientation, perhaps partly because of the absence of a viable "ideological" challenger to the incumbent president. Stylistic differences did emerge in expressed likes and dislikes about Nixon, as professionals were very critical of Nixon's failure to support Republican candidates for other offices (though some approved of his own statesmanlike campaign), while amateurs were more likely than professionals to cite policy reasons as both likes and dislikes.

Hitlin and Jackson (1977) studied the 1974 Democratic Mid-Term Conference, finding that younger and more educated delegates were more likely to be amateurs, though sex and race were statistically insignificant. Years of party service, holding party office, and delegate selection at the state rather than district levels were related to professional orientations, while the insignificance of holding public office suggested that amateurs had begun to move into positions of power. Within a liberal party nationally, amateurs tended to consider

themselves "liberals" while professionals favored self-identification as "moderates."

Jackson, Brown, and Brown's (1978) examination of the 1976 Democratic convention revealed a presidential nominee in the ideological middle with broad-based support among numerous demographic groups. Hence, Carter delegates did not differ significantly from other delegates on four items measuring amateur-professional orientations, though Carter delegates were slightly more likely to choose party unification as an important function of the convention. The two most important functions cited by party delegates were putting together a "winning team" and adopting "correct issue positions," suggesting that the amateur and professional orientations are not necessarily mutually exclusive.

Stone and Abramowitz (1983) draw a distinction between stylistic orientation in attitudes and in behavior. While state party convention delegates in both parties in 1980 said they preferred ideological purity over concentration on electoral victory, their perceptions of the electability of presidential hopefuls exerted a greater impact on their candidate preferences than did their perceived ideological proximity to the candidates. Furthermore, the primacy of electability concerns over ideological views was evident among delegates most highly "amateur" in orientation as well as among professionals and mixed motive delegates. While some rationalization did occur, as delegates tended to perceive the candidate closest to them ideologically as a more electable candidate, the direct effect of electability on candidate preferences remained more important than the total (direct and indirect in path analytic terms) effect of ideological proximity.

Clarke, Elliott, and Roback (1991) find that amateurs and professionals at the 1980 Republican national convention possess the same kind of belief system.

Both groups structure their policy views in terms of two dimensions--economic and social issues. Differences did emerge in terms of extremism, however, as Republican amateurs were more conservative than professionals on both of these issue dimensions. The authors define the amateur and professional groups by combining separate dimensions of amateurism and professionalism--separate dimensions that may be artifacts of an agreement response bias and the direction of the question wordings.

Hofstetter's (1971) analysis of stylistic orientation among members of a liberal reform organization and both parties' ward leaders in Columbus, Ohio produced two dimensions as well, which he labelled as party procedure-accountability and issue-participation factors, though again it is interesting to note that all six items in the latter dimension were worded in an amateur direction (the other factors' items varied in their wording direction). This extensive study of the validity of the amateur-professional scales is characterized by low correlation coefficients, however. There is a slight tendency for those older in age, blacks, and men to be more professional than young white females, and for long-time residents in the community, those being more concerned with local than national politics, and those who have worked for the party for a longer time and for more hours per week to be more professional than their opposites. Regarding motives for remaining active in politics and what shapes one's evaluations of candidates, solidary incentives (especially party loyalty) predicted professionalism on the procedural dimension while purposive incentives predicted amateurism on the other dimension. On both dimensions, ward leaders of the regular party organization had more professional orientations than did members of the insurgent organization, and liberals had more amateurist orientations than did non-liberals.

Using the same dataset and adding a behavioral indicator of stylistic orientation as the dependent variable, Hofstetter (1973) defines amateurs as members of the liberal reform group and professionals as both parties' ward leaders. He finds that those who are younger, less integrated into the community, of a higher socioeconomic status, having amateur-oriented role perceptions, and a liberal self-identification are more likely than their group opposites to be members of the amateur organization (the last relationship is an artifact of the absence of data from a conservative reform group). Regarding the importance of incentives in remaining active in politics, those stressing solidary motives were more likely to be conservatives, while those stressing purposive motives tended to be liberals.

Browder and Ippolito (1972) found that an "amateur" orientation which they defined using motivational incentives alone predominated within both party organizations in a suburban county of Georgia. They found that impersonal incentives such as the desire to affect government policy were the most important reasons for becoming and remaining active in the party, thereby showing significant durability. Activists also stressed impersonal incentives when trying to recruit others to become active in the party. While party members rated such solidary incentives as helping in a friend's campaign and "excitement" as opportunities that were more available than purposive incentives, they recognized that parties were better able to provide impersonal rewards such as influencing government policy than were other organizations.

SURVEY DESIGN

A mail survey of all Democratic and Republican county chairs and a random

sample of each party's county executive committee members throughout the South was the data source for this paper.[1] Three mailings were sent beginning in January and ending in April of 1991, and the response rate averaged 50% and ranged from 40% for Louisiana Democrats to 68% for North Carolina Republicans with Republicans generally having a slightly higher response rate. One or more political scientists, based at a university in each state, was responsible for collecting the data from that state. This Southern Grassroots Party Activists Project was led and coordinated by Charles D. Hadley and Lewis Bowman.[2]

FINDINGS AND INTERPRETATIONS

Importance of Motivations for Activism and Stylistic Orientations towards Politics

Purposive incentives appeared most important in motivating southern grassroots activists to accept their positions as county committee members or chairs. The most important motivation cited by both Democrats and Republicans was a concern with public issues (table 1). Two other motivations that appeared in the top five were also purposive in nature--perceiving campaigns and party work as ways of influencing politics and government. Yet we should recognize that non-purposive incentives also played an important role in motivating party workers to seek their current positions. The second most important incentive (out of a list of sixteen items) was to support a candidate that one believed in, illustrating the centrality of the modern candidate-centered style of campaigning and governing that has displaced the primacy of the party bosses as parties have declined in influence throughout the century. Yet while partisanship may be a

less central force than in previous decades, it remains an important motivator, as being strongly attached to a party psychologically is one of the top five incentives of each party's activists. Our study also confirms the relative unimportance of material motivations, as business contacts, building a personal political position, and gaining community recognition were the three items cited least frequently by both parties.

More direct comparisons between the two parties provide some interesting insights into the nature of the party organizations in the contemporary South. Democrats appear to be more motivated than Republicans by a diverse range of factors--solidary motives such as friendships and social contacts, the excitement of the campaign, family political history, as well as other motives such as community obligation and recognition and being close to important people (table 1). Republicans were more motivated than Democrats by purposive incentives--public issues and a desire to influence government. These party differences may be related to the historical position of the Democrats as the majority party in the South with the most competitive primaries, thereby providing more opportunities for activists to make friends and serve their community. The more ideologically cohesive, minority Republican party often gained adherents by capitalizing on popular discontent with the increasingly liberal nature of the majority party.

When asked their single most important reason for occupying their current party position, a concern over issues was again the number one motivation of both parties (table 2). Partisan attachment, candidate support, and using party work to influence government also remained among the most important goals. When forced to prioritize the incentives, other motivations emerge as important motivations--a feeling of obligation to the community, and seeing politics as a

way of life. Apparently contemporary southern activists are motivated by a diversity of concerns, not simply purposive goals. Such material incentives as business contacts and being recognition by the community remain among the lowest priorities within both parties. Regarding inter-party differences, once again Republicans are more motivated by a concern over public issues and a desire to influence government, while Democrats place a higher priority on their partisan attachments and the obligation of serving their community.

Turning to what motivated party members to first become active in politics, we find the operation of a similar diversity of incentives. A concern with issues was the top priority in both parties, while candidate support, influencing government, party attachment, and a sense of community obligation were other high priorities of both Democrats and Republicans (table 3). Republicans were significantly more motivated than Democrats by purposive incentives such as public issues and a desire to influence government, while Democrats were somewhat more motivated by party attachments and a sense of obligation to the community.

A direct comparison between what motivated party workers to first become active in politics and to then occupy a position in the party organization sheds some light on whether motivations tend to shift from purposive to solidary orientations, or whether they tend to remain stable over time. While individual reasons may become more or less important over the years, the broader motivational types remain remarkably unchanging in the aggregate. Regarding purposive incentives, activists were slightly less motivated by public issues, but somewhat more motivated by using party work as a tool to influence government (table 4). In terms of solidary goals, reflecting aging and the natural maturation effect of growing apart from one's parents, party workers became somewhat less motivated by their family's partisan involvement. On the other

hand, their strong attachments to the party as well as their coming to view politics as a way of life became increasingly important motivators. A final factor that changes in priority is candidate support, which becomes a weaker motivation over time, reflecting the departure from the political scene of an inspiring candidate who first motivated people to become highly active in politics, as well as the absence of equally inspiring successors.

Our study provides some evidential support for both of the conficting traditions regarding whether motivations shift over time. In response to a changing political environment, the opportunities that it provides in actuality, and changing personal needs, an activist's specific motivations will indeed tend to shift somewhat. However, their more general motivations toward political activity tend to remain the same, focusing toward purposive and/or solidary orientations. The aggregate stability of general motivations is reflected when one combines separate items into the three scales detailed in tables 8 and 9. Depending on whether or not one includes the politics as a way of life item as a solidary one and the candidate support item as a purposive one, preference for purposive motives ranged from 39 to 52% as an initiating incentive and 40 to 49% as a sustaining incentive, while support for solidary motives ranged from 21-25% initially to 18-27% as sustaining incentives. Material motives also remained very stable at 3% at both time points. Yet we do not want to overemphasize the stability of motivations, and we caution the reader that both initiating and sustaining motivations require that party workers recall what motivated them in previous years, and that the initiating motivation requires even greater recall facilities than the sustaining motivation.

Identical patterns of shifting motivations in response to environmental changes within a framework of stable overall basic orientations emerge within

each party. A slight decline in the importance of issues generally is counteracted by the increased recognition that active involvement in party work may help one influence politics and government (tables 5-6). Grassroots activists within both parties also appear less motivated by family and candidate factors and more highly motivated by party attachment, viewing politics as a way of life, and among Democrats a perceived obligation to the community. At no time are material incentives of much importance for either party, motivating less than five percent of grassroots activists. While the proportions of activists of each party falling into broad purposive, solidary, and material motivational categories remain relatively constant over time, at each time point purposive incentives motivated more Republicans than Democrats. Among Republicans, purposive incentives outnumbered solidary motives by about a three-to-one margin, while among Democrats the margin was approximately a one-and-a-half to one edge.

Not only does diversity characterize motivations toward activism, but it also reflects grassroots party workers' stylistic orientations toward politics. On only one of five statements designed to measure the extent of support for an amateur or professional orientation do party workers exhibit a consensus--about 90% of both parties agree that candidates shouldn't compromise their values even if necessary to win an election (table 7). The other four statements are worded in such a manner that agreement with them constitutes a more "professional" orientation. Those statements are favored by only 39% to 50% of party activists, figures that may be inflated by an "agreement" artifact of survey research--the tendency of some respondents to agree with statements read to them regardless of their own ambivalent or non-existent opinions. Widespread agreement with an "amateur" item and a failure to more highly agree with professional items suggest that contemporary southern grassroots activists are somewhat more oriented toward

an amateur than professional orientation, though many undoubtedly exhibit conflicting and/or a middle-of-the road stylistic orientation.

Party differences are quite evident on three of the five amateur-professional questionnaire items. Republican party workers are more likely than Democrats to exhibit a more amateuristic orientation, a finding consistent with their being more motivated by purposive incentives. Majorities of the two parties even take opposing positions on whether party workers should support a candidate that they basically disagreed with, with 60% of Democrats favoring backing the candidate and 62% of Republicans disagreeing (table 7). Over 10% more Democrats than Republicans agree that party unity is more important than a free discussion of divisive issues, as well as that party platforms should ensure party unity by avoiding controversial positions. Party differences on the remaining two items were only 4% in magnitude, but one of those items exhibited very little variation in responses.

Party differences in purposive motivations and stylistic orientations suggest that a number of the questionnaire items we have been examining may be tapping the same concept or dimension, so we turn to factor and cluster analyses of the incentive and stylistic items. The ability to reduce the large number of items into a smaller number of factors, each of which includes a number of questions, would not only simplify our more in-depth analysis of the correlates of motivations and stylistic orientations, but also lead to more valid conclusions by reducing random measurement error in the indicators.

A factor analysis (varimax rotation) of the incentives for activism produced five factors, three of which were clearly the solidary, material, and purposive incentives (table 8). The solidary dimension incorporates the diverse topics that Clark and Wilson mention, such as party, friendship, and fun, as well

as one's family history of political activism. The material dimension incorporates business contacts and building a personal position in politics, but also includes recognition in the community which party workers apparently perceive as helping attainment of the other two material goals. The purposive dimension is pretty standard, including issues and two items on influencing government. The fourth dimension is a candidate-civic duty dimension, while the fifth dimension is a personal friendship dimension.[3] Our subsequent analyses shall concentrate more on the first three dimensions, which are of greater relevance to previous studies of motivations for activism.

We finally confirm the validity of simple additive scales of each of these three incentives by examining a correlation matrix of the items. The average Pearson correlations among items tapping the same dimensions ranged from .36 to .52, reasonably high correlations given such attitudinal data and the statistic employed (table 9). Additional confirming evidence is provided by the average correlations between items from different dimensions, which in all cases were lower than the average intra-cluster correlations.[4] The existence of correlations between the dimensions confirms our findings in table 1, that the three incentives for activism are not mutually exclusive. Many party workers may indeed be motivated by more than one type of incentive. A further test of the generalizability of these three dimensions involved repeating the analyses for each party separately. The same patterns of factor loadings for the items in table 8 existed for each party, confirming the existence of solidary, material, and purposive dimensions for both Democrats and Republicans. The only deviant item was issues for Democrats, which loaded equally on the purposive and candidate-civic duty dimension, though it was slightly more related to the purposive items than to the other two items, and is classified as such in

subsequent analyses.[5]

The amateur-professional dimensionality test was an even more straightforward exercise, as one dimension clearly emerged that incorporated organizational unity, unifying behind the nominee, an inclusive platform, and maintaining neutrality during the primary. The fifth item failed to load on this amateur-professional dimension, perhaps because of the minimal variation in party workers' responses on that item, or because it was the only item worded so that an agreeable response constituted an amateuristic orientation (table 10). The average Pearson r correlation among the four questionnaire items loading on factor 1 and therefore included in the amateur-professional scale was .32. None of these items were significantly related to the fifth item, which was excluded from the scale. The same kind of strong evidence in favor of unidimensionality in amateur-professionalism was found for each of the parties when examined separately.

The Correlates of Stylistic Orientations toward Politics

Given the unidimensionality of amateur-professionalism and a desire to reduce random measurement error in the individual questionnaire items, we created an amateur-professionalism scale by simple summation of the four questionnaire items. After recoding for ease of interpretation, the resulting scale ranges from a score of 1 for most amateuristic to 13 for most professional. Simple additive scales were also formed rating the importance of various types of incentives for seeking one's current party position. The items comprising these solidary, material, and purposive scales are listed in table 8.

Despite conflicting and inconclusive findings by previous studies regarding the role of socioeconomic status, it serves as a key demographic characteristic that is related to amateur-professionalism among southern grassroots party activists. Higher income and college educated activists have a more amateuristic style, compared to party workers with a lower socioeconomic status (SES) who prefer a more professional orientation (table 11). The more professional orientation of the lower SES may reflect the historic importance of party machines in distributing the spoils of electoral victory to the organization's strongest supporters, such as less socially advantaged groups. It may also reflect a less sophisticated understanding of politics oriented around dogmatic party loyalty, and unawareness of modern management techniques that stress democratic decisionmaking styles.

Our study finds little support for the notion that groups previously excluded from party organizational leadership positions adhere to a more amateuristic orientation towards politics. Women are not more likely to be amateurs than are men, and African-Americans are actually more likely than whites to be professionals (table 11). One possible explanation is that members of these groups may not perceive themselves as "outsiders," in that women have often served as the "footsoldiers" in many southern political campaigns and blacks began entering the southern Democratic party organizations nearly three decades ago. Another possible explanation is that these groups in the South may be somewhat less assertive about their political situation than their counterparts in the North, given the traditionalistic culture of the old Confederacy that stresses deference to authority figures. A third factor may be socioeconomic status, since both groups tend to have a lower socioeconomic status than white males, and lower SES activists tend to have a more professional orientation.

Socialization forces may exert a major impact on stylistic orientation, as activists may be socialized over time to acquire a more professional orientation. Those 65 and older are much more likely to be professionals than are those under 40, who possess a more amateuristic orientation (table 11). It seems unlikely that this pattern is unique to the current time period, since previous national studies have consistently found similar age differences in stylistic orientation. Growing up in the more traditionalistic South is also related to a more professional style towards politics, compared to growing up in other regions. Related factors are how long one has lived in the state and whether one is retired, as long-time state residents and retirees have a more professional orientation compared to relative newcomers and those not yet retired. In the traditionalistic South, religion may also play some slight role in shaping one's stylistic orientation towards politics. Protestants, those attending church frequently, and activists backing a literal reading of the Bible and claiming to have been "born again" are somewhat more likely to be professionals compared to non-Protestants and less religiously involved activists.

One important source of a professional orientation is one's parents, especially among Democrats. Democratic activists who recalled their mother's and father's partisanship as being Democratic were much more likely to possess a more professional orientation than were those whose remembered their parents as Independents or Republicans (table 12). Though weaker in magnitude, similar patterns emerged for Republican activists. Republicans who recalled both parents as being Republican had a more professional orientation than those recalling parents as being Democrats or Independents. On the other hand, whether one's parents were remembered as being politically active exerted almost no effect on stylistic orientation.

Adult experiences may also exert an important socializing effect, as those active in state politics for over 30 years are much more likely to possess a professional orientation than those active less than 10 years (table 12). Another possible explanation for greater professionalism among long-time activists is that an amateuristic style may be less of a motivating force in stimulating continued political activity, since amateurs may be less strongly partisan psychologically. For example, Democratic activists who strongly identify with their party are much more likely to be professionals compared to those only weakly identifying with their party or regarding themselves as Independents. Similarly, Republican party workers who are strong partisans are much more professional compared to weak partisans and Independents. Furthermore, these patterns exist for partisan identification defined either as a psychological identification with the national party or the state party. A behavioral indication of party loyalty is whether one has ever switched parties, where we find that party switchers are much more likely to be amateurs compared to those who have never changed parties.

Whether one has held political office is also related to amateur-professional styles. County chairs are significantly more professional than are county committee members, who have a more amateur orientation (table 12). Those in their second or later term of office as county chair or committee member are also more professional than those in their first term. Activists who have held elective positions, appointive office, or previous party positions also possess a more professional orientation than less accomplished party colleagues.

It is finally interesting to note that among southern grassroots party activists, Democrats have a more professional orientation while Republicans possess a more amateuristic style (table 12). One possible explanation is that

as members of the historically dominant party, Democrats have been involved in politics longer and have held more political positions. Or perhaps Democrats are more integrated into the local community, and better reflect the traditionalistic culture of the South. Yet another possibility is that Republicans as the insurgent party challenging an entrenched majority party are more motivated by purposive incentives such as the desire to promote their ideological views. We now turn to an examination of how motivations and incentives for activism may relate to amateur-professionalism.

A diverse range of incentives appears to be related to a more professional orientation, suggesting that professionals may be more psychologically involved in politics than amateurs. The two most important sources of a professional orientation are solidary incentives and a strong attachment to the party (table 13). Interpersonal relations are highly related to a professional orientation in other ways as well, as those rating friendships with a candidate or with a political party official as very important in their decision to seek their current party position were significantly more likely to be professionals compared to those rating friendships as unimportant. Furthermore, being urged to run for the party position by an elected official, the county chair, a political candidate, or a party committee member were all significantly related to a more professional orientation compared to those listing these individuals as being unimportant in their decisions to seek the organizational position.

A sense of community obligation, material incentives, and believing in a candidate were other incentives that were related to a professional orientation (table 13). Even more important was the strong relationship between personal importance of the position and stylistic orientation, as those regarding the party position as personally important to them were much more likely to be

professionals compared to those regarding the position as unimportant. Activists also appear to have similar motivations in switching parties as they do in gaining a party organizational position. Friendships and a desire for personal advancement as reasons for party switching were related to a more professional orientation, as was a desire to move to the more active and organized party.

Amateurs appear to possess a more narrow range of motivations, focusing on purposive, issue-oriented goals that are determined by the individual in isolation from other persons.[6] When asked to name the single most important reason for seeking the current party position, those who claimed to have made their own decision were somewhat more likely to possess an amateuristic style compared to those claiming to have been influenced by candidates, public officials, or party members (table 13). The only incentive related to an amateuristic style was a purposive one, and that was the case solely for Republicans. Issues also appeared to be important to amateurs in causing party switching, while those citing other reasons for party switching were more likely to be professionals.

The greater motivation of professionals compared to amateurs is evident when one examines the activities that they perform as party organization members. Attending to party business and meetings, as well as county party organizational work are most highly related to a more professional orientation (table 14), as might be anticipated. But so too are a range of campaign activities, as those most active in raising money, promoting voter registration drives, contacting voters, and maintaining public relations are more likely to be professionals than are the inactive. Recruitment activities are also related to professionalism, as those active in recruiting and working with campaign workers, and in seeking out (and being sought out by) candidates for office had a more professional

orientation than the inactive.[7]

That professionals are the "workhorses" of the party organizations is also clear when asking party workers how actively they are involved in elections at different levels. Those very active in elections at each level--local, state, and national--possess a more professional orientation compared to those who are not very active (table 14). Professionals are also more likely to communicate with other party members and with public officials, compared to amateurs. Those communicating frequently with other party committee members, the county or state party chair, the state or national party committee, and local, state, and national governmental officials were more likely to possess professional orientations compared to those never communicating with them (data not shown). Professionals were also more likely to believe that the local party should remain free of state party direction, that the state party should remain free of national direction, and that the party should be built from the top down, than were amateurs.

The more partisan orientations of professionals also have a behavioral effect--they shape party members' attitudes toward prominent political leaders as well as the vote itself. Democrats voting for Dukakis were more likely to be professionals, while Bush Democrats had a more amateuristic orientation (table 14). The reverse was the case for Republicans, where Dukakis supporters were more amateuristic and Bush supporters more professional. Evaluations of Republican Presidents Reagan and Bush exhibited the same patterns. Republicans rating the job performances of these Republican Presidents as excellent or good were more likely to be professional, while those more disenchanted with them were more amateuristic. Conversely, Democrats rating Reagan and Bush favorably were more amateuristic in orientation, while those rating them unfavorably were more

professional.

Despite the intense partisanships, motivations, and activity levels of professionals compared to amateurs, ideological self-identification and issue positions are only weakly related to stylistic orientation.[8] The only consistent pattern, validated with both indicators, was that very conservative Republicans were more likely to possess an amateuristic orientation compared to other Republicans (table 15). Hence, in the Republican party the more issue-concerned amateurs tend to have more extreme ideological views drawn from the dominant conservative wing of the party, compared to professionals. The more ideologically-divided Democratic party in the South lacks a clearly dominant philosophy, and historically was more conservative in orientation than the national Democratic party. Hence, the Democratic pattern is less clear, as the stylistic effects of ideological extremism are less evident. Instead, conservatives generally are somewhat more likely to be amateurs, compared to liberals.

THE CORRELATES OF MOTIVATIONAL INCENTIVES

While a number of studies have examined the correlates of amateur-professionalism at the national level or in isolated communities, very few have examined the correlates of incentives for activism, focusing instead on the relative importance of these incentives and whether they tend to change over time. As with stylistic orientation towards politics, we find that motivational incentives are significantly related to level of political activity. Furthermore, level of motivation appears more important in inducing activism than does the type of motivation. Those reporting high activity in local, state, and

national campaigns compared to those inactive rated solidary, material, and purposive incentives as more important in their decisions to seek the party office they are currently holding (table 16). Solidary incentives exert a principal impact on level of party position and personal importance of the party position, as county chairs and those considering their party position as being personally important to them rate solidary incentives as more important than do county committee members and those devaluing their party position.

Agent of recruitment to party office is also related to all three types of incentives, rather than to only one type of incentive, such as solidary goals. Those saying that party committee members, county chairs, elected officials, and candidates for office were major considerations in their decision to seek their current party office rated solidary, material, and purposive incentives as more important than did those claiming that such political figures were not considerations (table 17). Only when asked to choose the most important consideration for seeking their party position did some differentiation of motives emerge--those saying that they had decided to run pretty much on their own rated material and purposive incentives somewhat more highly than did those citing any of the four types of political figures, while solidary incentives were not differentiating factors.

Partisan intensity is also related to all three types of incentives, though within both parties differences in magnitudes are evident for the incentive types. Strong partisans rated solidary, material, and purposive incentives as more important than did weak partisans and independents (tables 18-19). Solidary incentives appear most highly related to partisan intensity, while material incentives are least important. Among Democrats the same patterns emerge for 1988 presidential vote, where Dukakis voters rated each incentive as more

important than did Bush defectors, with solidary incentives most important and material incentives least important. No significant relations between the vote and incentives emerge among Republicans.

While solidary incentives appear to play a special role in promoting partisanship, purposive incentives exert a special impact on ideological considerations, especially among Republicans. Republicans who are conservative or very conservative rate purposive incentives as more important than do liberals and moderates (table 19). On the other hand, there is some tendency for less conservative Republicans to rate solidary and especially material incentives as more important than do conservatives. Hence, ideological dissidents from the conservative nature of the contemporary southern Republican party are able to derive some satisfaction from non-policy reasons for party activism. Liberal Democrats are more likely than conservatives to rate all three types of incentives as very important, though material incentives are least related to ideological concerns (table 18).

CONCLUSIONS

The contemporary party system in the South exhibits an interesting differentiation between the traditionally dominant Democratic party and the insurgent Republican party. Democrats tend to be motivated more by solidary incentives than do Republicans, and retain a more "professional" concept of party work. One source of Democratic professionalism may be their greater tendency to agree with their parents' traditional party ties than can be said for Republicans historically in the minority. Democratic professionalism may also reflect integration into the community, exhibited by advancing age, growing up in the

traditionalistic South, and working for the party for many years. The strong party loyalties found among professionals remains important in sustaining the contemporary southern Democratic party organization.

The surging Republican party is more influenced by purposive incentives and adheres to a more amateuristic style. Such issue-oriented amateurs are often self-starters rather than strongly encouraged by other people to become active in the party organization. A more purposive, amateuristic orientation is understandable given the absence of consistent partisan cues from parents, as well as less community integration due to greater in-migration. The issue orientation of such Republicans is clearly a conservative one, rather than reflecting a diversity of views.

Lest we overemphasize the differences between the parties, we should reiterate that neither party is monolithic in its motivations or stylistic orientations. Some Democrats appear more motivated by purposive incentives and possess an amateuristic style, while some Republicans pursue solidary incentives and a professional style. And the differences in tendencies between the Southern parties appear rational adaptations to their political environment, rather than disfunctional to their organizational goals. The South is a more conservative region, hence amateur Republicans promoting a conservative philosophy will not necessarily nominate candidates who are too extreme for voters. Southern Democrats can compensate for the relative unpopularity of their national party's liberalism by shying away from an issue-oriented amateuristic style, and emphasizing professionalism, historical party loyalty, and the importance of friendship and interpersonal ties in party work.

NOTES

1. Southern states sampled included Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, Virginia.

2. The intellectual leadership and inspiration of Lewis Bowman and the good judgement and hard work of Charles Hadley were instrumental in the successful completion of this Project. The Southern Grassroots Party Activists Project is a collaborative effort funded by the National Science Foundation under Grant SES-9009846 and administered through the University of New Orleans. The Government has certain rights to this data. Any opinions, research findings, conclusions, or recommendations reported from this project are those of the named authors and do not necessarily reflect the views of the National Science Foundation.

3. The item wordings for the last two factors were: party work helps me fulfill my sense of community obligation; to support the candidate I believe in; friendship with a candidate; and friendship with a political party official.

4. We excluded two additional items from the three incentive scales: I like the feeling of being close to people who are doing important things; and political work is part of my way of life. The important people item was fairly equally correlated to the items in the material and solidary dimensions, while the way of life item was fairly equally related to the solidary and purposive items.

5. Among Democrats, the Pearson r's between issues and each of the other two purposive items were .41. The Pearson r relationships between issues and civic duty was .35, and between issues and candidate was .37. Among Republicans, the corresponding Pearson r's were .39 for each of the purposive items, .24 for civic duty, and .33 for candidate.

6. In these t-tests involving solidary, material, and purposive incentives, the scales were trichotomized into relatively equal groups, and the means of the two extreme groups were compared. The other incentives listed in table 13 are individual questionnaire items rather than scales--items that were not highly related enough with other items to justify being combined into the three incentive scales.

7. These same patterns also emerge with a set of questionnaire items asking activists what activities they had performed in recent campaigns, though the magnitudes of the relationships are not as strong as when asking about the important activities performed in their current party position and including a more diverse range of responsibilities.

8. A factor analysis of 13 issue items yielded one major factor with 7 items loading highly on it. Those items consisted of jobs, health care, health-education services, taxes versus services, affirmative action for blacks, and improving the economic positions of blacks and women (2 separate items), thereby constituting an economic-racial dimension. The average Pearson r correlation among these items was a respectable .43, and a simple summation of these items yielded an issue scale. Factors 2 and 3 contained diverse items pertaining to

women's issues, economics, social issues, and foreign affairs, and these inter-item correlations were weaker in magnitude, so we omitted them from further analyses. The issue scale was divided into five categories with roughly equal numbers of activists in each--very liberal, somewhat liberal, moderate, somewhat conservative, and very conservative categories. The equal proportions masked immense ideological differences between the parties, with 66% of Democrats falling within the two liberal categories and 67% of Republicans falling in the two conservative categories.

TABLE 1

INCENTIVES FOR SEEKING CURRENT PARTY POSITION
(% rating it Very Important)

	DEM	REP	ALL
Candidate Friendship	18	14	16
Party Official Friendship	22	20	21
Politics is Way of Life	43	37	40
Strongly Attached to Party	57	53	55
Friendship/Social Contacts	31	21	26
Family Involved in Party	21	14	18
Campaign Fun/Excitement	29	22	26
Build Personal Positions in Politics	10	8	9
Campaigns Influence Politics/Gov't	45	55	49
Party Work Influences Politics/Gov't	47	61	54
Close to People doing Important Things	26	16	21
Business Contacts	6	3	5
Fulfill Community Obligation	42	34	38
Community Recognition Feeling	14	7	11
Concern with Public Issues	63	70	66
Support Candidate I Believe In	62	65	63

NOTE: Question asked was: "Rate each of the following in terms of its importance in your personal decision to seek your current party position." Exact question wordings of many of these items are provided in table 8.

TABLE 2

PARTY DIFFERENCES IN SUSTAINING INCENTIVES
(% saying most important consideration)

	DEMOCRATS	REPUBLICANS
Candidate Friendship	5	3
Party Official Friendship	6	5
Politics is Way of Life	10	8
Strongly Attached to Party	14	9
Friendship/Social Contacts	3	1
Family Involved in Party	3	2
Campaign Fun/Excitement	1	1
Build Personal Positions in Politics	2	2

Sustaining Incentives were measured by asking, "Which consideration listed above was the most important in your personal decision to occupy your current party position?"

TABLE 7

AMATEUR-PROFESSIONAL ORIENTATIONS AMONG PARTY WORKERS
(% agreeing with statements)

	DEM	REP	ALL
Good party workers support any candidate nominated by the party even if they basically disagree with the candidate.	60	38	50
Party organization and unity are more important than free and total discussion of issues which may divide the party.	46	32	39
Candidates should not compromise their values even if such compromise is necessary to win.	87	91	89
Controversial positions should be avoided in a party platform to insure party unity.	51	40	46
Good party workers should remain officially and unofficially neutral in primary contests even when they have a personal preference.	50	47	49

TABLE 8

ROTATED FACTOR MATRIX (VARIMAX) FOR INCENTIVE ITEMS

	FACTOR 1 (Solidary)	FACTOR 2 (Material)	FACTOR 3 (Purposive)
Solidary Items			
V17 (Party)	.70	-.05	.23
V18 (Friendship)	.55	.26	-.05
V19 (Family)	.64	.09	-.07
V20 (Fun)	.61	.36	.15
Material Items			
V21 (Position)	.17	.75	.24
V25 (Business)	.05	.75	0
V27 (Recognition)	.14	.71	0
Purposive Items			
V22 (Influence/Campaign)	.17	.13	.85
V23 (Influence/Party)	.11	.09	.86
V28 (Issues)	.09	-.04	.58

NOTE: Respondents were asked to, "Rate each of the following in terms of its importance in your personal decision to seek your current party position." Response categories were very important, somewhat important, not very important, and not important at all. Questions wordings of each variable follow, and variables were combined into three scales for each incentive group.

Solidary:
V17- I am strongly attached to my political party;
V18- I enjoy the friendship and social contacts I have with other party workers;
V19- My family's involvement in party politics;
V20- I like the fun and excitement of campaigns.
Material:
V21- I am trying to build a personal position in politics;
V25- Party work helps me make business contacts;
V27- Party work gives me a feeling of recognition in the community;
Purposive:
V22- I see campaign work as a way to influence politics and government;
V23- I see working in the political party generally as a way to influence politics and government;
V28- My concern with public issues.

TABLE 9

CORRELATION MATRIX AMONG INCENTIVES FOR ACTIVISM
(Pearson R's)

	V17	V18	V19	V20	V21	V25	V27	V22	V23	V28
V17	---									
V18	.39	---								
V19	.28	.32	---							
V20	.36	.49	.33	---						
V21	.13	.20	.14	.34	---					
V25	.10	.27	.19	.27	.43	---				
V27	.19	.38	.21	.37	.40	.47	---			
V22	.29	.19	.13	.31	.23	.10	.16	---		
V23	.28	.15	.11	.23	.19	.09	.15	.73	---	
V28	.26	.17	.09	.19	.10	.04	.12	.41	.41	---

Average Intra-Cluster Item Correlations:
Solidary Items = .36; Material Items = .43; Purposive Items = .52
Average Inter-Cluster Correlations:
Solidary-Material Items = .23; Solidary-Purposive Items = .20;
Material-Purposive Items = .13

TABLE 10

VALIDITY TESTS OF AMATEUR-PROFESSIONAL SCALE

Rotated Factor Matrix (Varimax):

	FACTOR 1 (Amateur-Professional Scale)	FACTOR 2 (Deviant Item)
V88 (Candidate Unify)	.75	.01
V89 (Organization Unity)	.82	.03
V91 (Inclusive Platform)	.70	.05
V92 (Primary Neutrality)	.50	-.34
V90 (Don't Compromise Values)	.08	.95

Correlation Matrix:

	V88	V89	V91	V92	V90
V88	---				
V89	.53	---			
V91	.29	.44	---		
V92	.21	.23	.24	---	
V90	.02	.03	.05	-.05	---

Average Intra-Cluster Item Correlation (excluding V90) = .32

NOTE: Respondents were asked whether they strongly agreed, agreed, disagreed, or strongly disagreed with the following statements:
V88- Good party workers support any candidate nominated by the party even if they basically disagree with the candidate;
V89- Party organization and unity are more important than free and total discussion of issues which may divide the party;
V91- Controversial positions should be avoided in a party platform to insure party unity;
V92- Good party workers should remain officially and unofficially neutral in primary contests even when they have a personal preference;
V90- Candidates should not compromise their values even if such compromise is necessary to win. (The codes of this item were reversed in order to be consistent with the amateur to professional code rankings of the other four items.)
V90 was excluded from the amateur-professional scale.

TABLE 11

DEMOGRAPHIC CORRELATES OF AMATEUR-PROFESSIONALISM

	Group Tendencies	
Demographic Factor	Amateurs	Professionals
Age	40 and Under (6.2)	65 and Older (7.7)*
Sex	Females (6.9)	Males (6.9)
Democrats' Race	Whites (7.2)	Blacks (8.0)*
Republicans' Race	Whites (6.3)	Blacks (7.3)*+
Education	College/Grad (6.5)	Hi Sch & Less (7.7)*
Family Income	$60,000 & Over (6.6)	$30,000 & Und (7.3)*
Retired?	No (6.6)	Yes (7.6)*
Yrs. Lived in State	20 & Less (6.3)	60 & Over (7.9)*
Region Grew Up In	Non-South (6.5)	South (7.0)*
Religion	Non-Protest (6.7)	Protestant (6.9)*
Freq. Church Attend	Never/Seldom (6.7)	Weekly (6.9)*
Born Again?	No (6.8)	Yes (7.0)*
Bible Literal Word	No (6.5)	Yes (7.1)*

NOTE: Cell entries are means of the amateur-professional scale for the subgroups listed. Means range from 1 for most amateuristic to 13 for most professional.

* indicates t-test for difference between means is statistically significant at .05 level.
+ Only 85 Republicans were blacks, only 2% of that party.

TABLE 12

PARTISAN ORIENTATIONS OF AMATEURS AND PROFESSIONALS

Factor	Group Tendencies: Amateurs	Professionals
Among Democrats Only:		
Mother Party Id	Non-Democrat (6.7)	Democrat (7.5)*
Father Party Id	Non-Democrat (6.8)	Democrat (7.5)*
State Party Id	Not Strong Dem (6.0)	Strong Dem (7.6)*
National Party Id	Not Strong Dem (6.4)	Strong Dem (7.7)*
Among Republicans Only:		
Mother Party Id	Non-Republican (6.2)	Republican (6.6)*
Father Party Id	Non-Republican (6.2)	Republcian (6.6)*
State Party Id	Not Strong Rep. (5.5)	Strong Rep. (6.6)*
National Party Id	Not Strong Rep. (5.5)	Strong Rep. (6.5)*
Both Parties Combined		
Parents' Pol. Active?	No (6.8)	Yes (6.9)*
Yrs Active State Pol.	10 or Less (6.5)	30 & Over (7.6)*
In 2nd Term of Pty Pos?	No (6.4)	Yes (7.0)*
Previous Pty Positions?	No (6.8)	Yes (7.0)*
Held Elective Position?	No (6.7)	Yes (7.1)*
Held Appointive Office?	No (6.7)	Yes (7.1)*
No. of Party, Elective, Appointive Pos. Held	0 or 1 (6.7)	3 or More (7.0) *
Held Public Office Ever?	No (6.9)	Yes (7.0)*
Ever Switched Parties	Yes (6.0)	No (7.1)*
Voter in 1988?	No (6.9)	Yes (7.0)
Party Position	Co. Comm. Member (6.8)	County Chair (7.5)*
Political Party	Republican (6.4)	Democrat (7.3)*

NOTE: Cell entries are means of the amateur-professional scale for the subgroups listed. Means range from 1 for most amateuristic to 13 for most professional.

* indicates t-test for difference between means is statistically significant at .05 level.

TABLE 13

MOTIVATIONS AND INCENTIVES FOR PARTY ACTIVISM

AMONG AMATEURS AND PROFESSIONALS

Factor	Group Tendencies: Amateurs	Group Tendencies: Professionals
Incentives for Seeking Current Party Position:		
Solidary Incentive	Not Important (5.8)	Very Import (7.8)*
Strong Party Attachment	Not Important (5.6)	Very Import (7.5)*
Friends with Pty Official	Not Imp. (6.2)	Very Import (7.4)*
Candidate Friendship	Not Important (6.4)	Very Import (7.6)*
Community Obligation	Not Important (6.4)	Very Import (7.3)*
Material Incentives	Not Important (6.4)	Very Import (7.2)*
Believe in Candidate	Not Important (6.4)	Very Import (7.1)*
Purposive (Rep Only)	Very Import. (6.2)	Not Import (6.4)*
Purposive (Dem Only)	Not Important (7.1)	Very Import (7.4)*
Urged to Run for Current Party Position By:		
Elected Official	Not Important (6.5)	Important (7.3)*
County Chair	Not Important (6.5)	Important (7.1)*
Candidate for Office	Not Important (6.6)	Important (7.2)*
Party Comm. Member	Not Important (6.5)	Important (6.9)*
Made Own Decision	Important (6.8)	Not Important (6.8)
Single Most Important Reason for Seeking Current Party Position	Own Decision (6.7)	Other 4 People (7.0)*
Personal Importance of Being Co. Committee Member	Not Important (5.9)	Important (7.6)*
Reason for Party Switch:		
Friends	Not Important (6.0)	Important (6.5)*
Personal Advancement	Not Important (5.9)	Important (6.8)*
Move to More Active, Organized Party	Not Important (5.7)	Important (6.6)*
Single Most Important Reason for Party Switch	Issues (5.9)	Other Reason (6.5)*

NOTE: Cell entries are means of the amateur-professional scale for the subgroups listed. Means range from 1 for most amateuristic to 13 for most professional.

* indicates t-test for difference between means is statistically significant at .05 level.

BEHAVIORAL EFFECTS OF AMATEURISM AND PROFESSIONALISM

Factor	Group Tendencies: Amateurs	Professionals
Activities Done in Current Party Position:		
Pty Business & Meetings	Not Important (6.0)	Important (7.1)*
Co. Pty. Organ. Work	Not Important (6.1)	Important (7.2)*
Contact Voters	Not Important (6.3)	Important (7.0)*
Raise Money	Not Important (6.5)	Important (7.2)*
Promote Voter Register	Not Important (6.3)	Important (7.0)*
Public Relations	Not Important (6.3)	Important (7.0)*
Recruit/Organize Workers	Not Important (6.4)	Important (7.1)*
Recruit Local Candidates	Not Important (6.4)	Important (7.1)*
Other Nominating Active	Not Important (6.5)	Important (7.2)*
Contact New Voters	Not Important (6.4)	Important (7.0)*
Campaigning	Not Important (6.5)	Important (7.0)*
Policy Formulation	Not Important (6.6)	Important (7.0)*
Increase Pol. Info. for Others	Not Important (6.7)	Important (6.9)*
Camp. Volunteers Usually Work with You	No (6.5)	Yes (7.0)*
Any Candidates Talk with You Before Running	No (6.6)	Yes (7.0)*
Every Suggest to Someone that They Seek Office	No (6.7)	Yes (6.9)*
Activity Levels among Both Parties Combined:		
Work in Local Elections	Not Very Active (6.1)	Very Active (7.2)*
Work in State Elections	Not Very Active (6.0)	Very Active (7.2)*
Work in Nat'l Elect	Not Very Active (6.4)	Very Active (7.1)*
Voted in 1988?	No (6.9)	Yes (7.0)
Partisan Direction of Effects		
Among Democrats Only:		
Reagan Job Performance	Excellent/Good (6.8)	Fair/Poor (7.5)*
Bush Job Performance	Excellent/Good (7.0)	Fair/Poor (7.5)*
1988 Pres Vote	Bush (6.1)	Dukakis (7.6)*
Among Republicans Only:		
Reagan Job Performance	Fair/Poor (5.7)	Exc/ Good (6.4)*
Bush Job Performance	Fair/Poor (5.2)	Exc/ Good (6.5)*
1988 Pres Vote	Dukakis (5.6)	Bush (6.4) *

NOTE: Cell entries are means of the amateur-professional scale for the subgroups listed. Means range from 1 for most amateuristic to 13 for most professional.
* indicates t-test for difference between means is statistically significant at .05 level.

TABLE 15

ISSUE AND IDEOLOGICAL ORIENTATIONS OF AMATEURS AND PROFESSIONALS

Factor	Group Tendencies: Amateurs	Group Tendencies: Professionals
Among Democrats Only:		
Ideology Identif.	Conservative (7.2)	Liberal (7.4)
Issue Scale	Conservative (6.6)	Liberal (7.5)*
Ideology Identif.	All Others (7.3)	Very Liberal (7.3)
Issue Scale	All Others (7.2)	Very Liberal (7.6)*
Among Republicans Only:		
Ideology Identif.	Conservative (6.4)	All Others (6.4)
Issue Scale	Conservative (6.1)	All Others (6.8)*
Ideology Identif.	Very Conser. (6.1)	All Others (6.5)*
Issue Scale	Very Conser. (5.8)	All Others (6.6)*

NOTE: Cell entries are means of the amateur-professional scale for the subgroups listed. Means range from 1 for most amateuristic to 13 for most professional.

* indicates t-test for difference between means is statistically significant at .05 level.

TABLE 16

INCENTIVES AND PARTY INVOLVEMENT

Factor	Group Tendencies: Not Important	Very Important
Solidary Incentives:		
Party Position	Co. Comm. Membr (8.0)	Co. Chair (8.5)*
Personal Importance of being Co. Comm. Membr.	Not Important (5.9)	Very Import (9.4)*
Local Elect. Activity	Not Active (6.5)	Very Active (8.7)*
State Elect. Activity	Not Active (6.0)	Very Active (8.9)*
Nat'l Elect. Activity	Not Active (6.8)	Very Active (8.8)*
Material Incentives:		
Party Position	Co. Comm. Membr (3.7)	Co. Chair (3.8)*
Personal Importance of being Co. Comm. Membr.	Not Important (2.7)	Very Import (4.3)*
Local Elect. Activity	Not Active (2.9)	Very Active (4.0)*
State Elect. Activity	Not Active (2.9)	Very Active (3.9)*
Nat'l Elect. Activity	Not Active (3.5)	Very Active (3.7)*
Purposive Incentives:		
Party Position	Co. Comm. Membr (8.2)	Co. Chair (8.4)*
Personal Importance of being Co. Comm. Membr.	Not Important (7.2)	Very Import (8.8)*
Local Elect. Activity	Not Active (7.4)	Very Active (8.5)*
State Elect. Activity	Not Active (6.7)	Very Active (8.7)*
Nat'l Elect. Activity	Not Active (7.2)	Very Active (8.8)*

NOTE: Cell entries are means of the solidary, material, and purposive scales for subgroups listed. Means range from low scores for unimportant considerations to high scores for very important considerations. The solidary scale ranges from 1 to 13, and the material and purposive scales range from 1 to 10.

* indicates t-test for difference between means is statistically significant at .05 level.

TABLE 17

INCENTIVES AND AGENTS OF RECRUITMENT

Factor	Group Tendencies: Not Important	Group Tendencies: Very Important
Solidary Incentives:		
Party Comm. Member	Not Consideratn (7.3)	Major Consid (8.3)*
County Chair	Not Consideratn (7.6)	Major Consid (8.5)*
Elected Official	Not Consideratn (7.6)	Major Consid (8.8)*
Candidate for Office	Not Consideratn (7.7)	Major Consid (8.8)*
Own Decision	Not Consideratn (7.2)	Major Consid (8.2)*

Sanctions and Sovereignty in the Cold War Era and Today

George E. Shambaugh
Department of Government
Smith College
Northampton, MA 01063

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

I. Introduction

Under what conditions can one state manipulate economic sanctions to alter the behavior of actors across international borders? The utility of economic sanctions have been debated extensively in public and scholarly circles.[1] This study adds to this debate by determining the conditions under which sanctions can be used effectively as a source of political influence. It does so by analyzing cases involving matters of "high politics," including sovereign autonomy and economic and military security, where sanctions are least likely to be effective.[2]

This articles analyzes the ability of the United States government to enforce its export control policy abroad between 1949 and 1988. The success of these efforts varied considerably and cannot be explained in terms of American hegemony or the distribution of resources within the Western alliance. Rather, the success of American enforcement efforts resulted primarily from of its use of economic sanctions against offending firms and states. Quantitative and comparative case study analyses demonstrate that foreign dependence on American suppliers and access to American consumer markets in certain industries enabled the United States to enforce its export control policy abroad since 1949. Further, the results suggest that dependence can be used by all states as a source of political power.

This paper is divided into six sections. First, the concept of dependence is refined and an argument linking dependence, sanctions and political power is developed. The following section specifies the goals and targets of U.S. export control policy. It identifies the enforcement mechanisms available to the U.S. government, and argues that economic sanctions offered the most potent means available. This argument is tested against competing hypotheses of economic and military hegemony through statistical analyses of 40 U.S. enforcement efforts from 1949 through 1988. The statistical analyses are supplemented with a more detailed comparative analysis of several pivotal cases. In conclusion, some of the potential costs of exploiting economic dependence to achieve political ends are identified, and avenues for future research are suggested.

II. The Argument: Dependence, Sanctions and Political Power

This section defines the concept of dependence and specifies the link between dependence and political power. Throughout the discussion, the targeted actor will be referred to as the "target," and the country initiating the sanctions will be referred to as the "enforcer." While the United States is the enforcer in the majority of the cases discussed, the findings presented here are applicable to all states in the international system.

The primary argument articulated below is that foreign dependence on local markets and suppliers greatly increases the likelihood that economic sanctions will be an effective source of political influence. Albert Hirschman was one of the first economic or political theorists to explicitly draw a link between economic dependence and political power.[3] Dependence is defined in terms of the costs of foregoing a particular relationship.[4] The party which values a particular trading relationship less will suffer proportionately less from its termination and will

consequently be able to exercise proportionately more influence over the other party.[5] The more costly it is for a targeted actor to forego a particular relationship, the more dependent it is on the maintenance of that relationship.

The costs associated with terminating a trading relationship with an enforcer are a function of two factors: the relative proportion of trade an actor conducts with the enforcer, and the availability of alternate trading partners. If a large proportion of trade is conducted with the enforcer, terminating those trading arrangements will be costly. If the costs of terminating a trading relationship with the enforcer are greater than the costs of abiding by its policies, then enforcement efforts are likely to be successful.[6]

This component of dependence is commonly associated with hegemony. Economic or military hegemony is often defined in part by the disproportionate possession of a particular set of resources or capabilities. Definitions of economic hegemony include, for example, references to a high volume of national exports or imports,[7] a relatively large gross national product,[8] a relatively high level of productivity,[9] or the disproportionate possession of natural resources (land, labor or capital).[10] A comparatively large possession of these resources may provide a means of exercising political influence over others that rely on them. However, predicting the likelihood of political influence based on the characteristics of one actor is fraught with difficulty. Such predictions fail to consider the characteristics or options available to the targeted actor.[11] The relative position of a hegemon provides no information about the relationships among the non-hegemonic actors in the system. As is demonstrated consistently in the cases below, the costs of terminating an economic or political relationship -- even a hegemonic relationship -- may be minimized if alternate partners or allies can be found.[12]

While all actors are "sensitive" to the termination or commencement of trade, some are more or less "vulnerable" than others.[13] A state or firm which can respond to, and compensate for, the termination of an agreement is less vulnerable than one which cannot do so. Here hegemonic states have an advantage since the existence of a large domestic market or domestic sources of supply decreases the vulnerability of a targeted state or firm from threats by international actors. On the other hand, even though a hegemon may be able to provide the largest consumer market or access to the most efficient suppliers of particular goods, threatening to cut off access to its markets or suppliers may have little effect if alternates can be found. Economic dominance is not sufficient to guarantee dependence, nor, as the cases demonstrate, is it sufficient to guarantee political influence.

Recognition that the presence of alternate trading partners can undermine political power resulting from economic dominance is an important insight that arguments of dependence have over traditional arguments linking economic hegemony and political power. The latter focus on the resource possessed by one actor, rather than the potential relationships between all actors in the system. As a result, these arguments ignore the implications of alternate, albeit smaller, partners.

The availability of alternate suppliers and alternate markets for a specific good can be interpreted as a function of the concentration of trade among all potential producers and consumers. If every country exported or imported the same amount of a particular good, then

that good could be purchased or sold anywhere. The concentration of markets and suppliers would be zero. If, however, only a few countries exported or imported a particular good, then the good could only be purchased or sold to them. The more concentrated the exports or imports of a particular good, the fewer the number of alternate markets or suppliers. In the case of a monopoly of production and exports, or of monopsony of markets and imports, no alternate suppliers or markets would be available and all suppliers would be concentrated in one country. The concentration of trade is related to hegemony, but it provides a more comprehensive measure of resources in the international system because it focuses on the distribution of trade among all states, rather than the relative share of the largest or most productive state.[14]

Dependence as a function of relative dominance of the Enforcer's exports or imports and the concentration of world exports or imports is summarized in Table 1.

Table 1: Dependence as a Function of Trade and Concentration

Concentration of World Exports/Imports	**Proportion of Target's Exports/Imports with Enforcer**	
	Low	**High**
Low	Low dependence	High sensitivity but low vulnerability to dependence on Enforcer
High	High vulnerability to dependence on others	High vulnerability to dependence on Enforcer

Firm and state dependence can be further broken down into dependence on access to markets and dependence on the supply of certain goods. The case studies presented below suggest that national governments are more likely to acquiesce to American export control policy when the supply of certain goods is threatened than when market access for their firms is challenged. A potential reason for the governmental preference for secured supply over market access is that the supply of specific goods, especially those considered necessary for national defense, have a more immediate and direct effect on perceptions of national security than do economic concerns which, while important, tend to have a more indirect and long term effect on national security.

In contrast, when access to traditional suppliers is restricted, economic firms often attempt to develop alternate sources of supply. In several of the cases analyzed below, firms were willing to develop substitutes for the restricted goods internally when alternate external suppliers were not available. This option is often difficult and it may require a large financial and technological capability, yet it minimizes dependence on foreign suppliers. Alternate markets

are, however, far more difficult to develop than finding alternate sources of supply. While national governments tend to be less concerned about access to foreign markets for their firms than about the supply of goods they cannot obtain elsewhere, firms are more protective of market access than supply.

Firm and state reactions to Enforcer initiatives against their interests are summarized as a function of dependence on market access and dependence on supply in Table 2.

Table 2: Successful Influence as a Function of Dependence

Dependence on Supply	**Dependence on Market Access**	
	Low	**High**
Low	Firm defiance, host government intervention	Firm compliance, host government indeterminate
High	Firm indeterminate, host government acquiescence	Firm compliance, host government acquiescence

Critics of this approach argue that market power (which is the result of supply and demand), is not necessarily equivalent to bargaining power between states (which is the result of the relative political evaluation of the consequences of state action).[15] Despite statements to the contrary, this criticism does not undermine the link between dependence and political influence; rather, it underscores a failure to specify the appropriate scope and domain of the influence attempt in question. Market forces of supply and demand affect the actions of firms directly. Regardless of host government action or inaction, firm actions appear to be governed by their dependence on American markets and suppliers.

Firms may seek the assistance of their host country's government to challenge U.S. policy, or they may not. Their ability to do so is a function of state-society, government-business relations.[16] Corporate influence of government decision making in the export control area has been very limited, and government action often proven to be costly to the firms involved. In addition, the cases demonstrate that even when the United States is unable to alter the foreign policies of its allies directly, it can influence the activities of firms in their territory by exploiting their dependence on access to the American consumer market and on the supply of various components and technology from American-based multinationals.

This model can be used to predict the outcome of U.S. efforts to implement its export control policy abroad from 1949 through 1988.

III. Extension of U.S. Export Controls Abroad, 1949-1988

A. Goals of U.S. Export Control Policy

Originally established as a means of maintaining security of munitions and other security items during wartime, export controls were a key component of U.S. foreign policy throughout the Cold War.[17] Export controls are currently used for three primary purposes: to maintain national security, to support its foreign policy, and to prevent the export of resources in short supply.[18]

U.S. export control policy is based on two pieces of legislation, the Trading with the Enemy Act of 1917 and the Export Control Act of 1949, which has been revised several times and is currently referred to as the Export Administration Act.[19] The Trading with the Enemy Act enables the President to investigate, regulate, or prohibit all commercial and financial transactions with foreign countries and their nationals during time of war or national emergency. This policy has been implemented through the Foreign Assets Control Regulations (FACRs) to embargo trade with the People's Republic of China, North Korea, North Vietnam and Cambodia in 1950, and through the Cuban Assets Control Regulations (CACRs) which have embargoed all trade with Cuba since 1963.[20]

The Export Control Act (later the Export Administration Acts) authorizes the President to curtail or prohibit the export of technical data as well as goods in order to "further the foreign policy of the United States and to aid in fulfilling its international responsibilities." It also allows the President "to exercise the necessary vigilance over exports from the standpoint of their significance to national security of the United States."[21] The regulation applies to all exports from the United States except those shipped to Canada for Canadian consumption.

The primary objective of U.S. export control policy is to prevent strategically sensitive technology and products from being diverted to specific restricted countries.[22] This requires the cooperation of all actors that possess or can produce the goods in question. To secure and monitor multilateral cooperation in the control of strategic commodities, the Untied States initiated the Coordinating Committee and Consultative Group in 1949.[23] While CoCom members have agreed to restrict the export of goods with direct military significance, the control of "dual use" goods and those with indirect military significance have been a matter of dispute since CoCom was established. The United States has consistently maintained and called for the control of more goods and technology than the other members of CoCom have been willing to accept.

B. Targets of U.S. Actions

The success of U.S. export control policy requires the cooperation of the multinational firms, including their foreign subsidiaries, that possess or can produce the items in question, and the acquiescence of the host countries within which these firms operate. If the targeted actor can secure access to comparable goods or technology from non-American sources, then the American restrictions will do little to slow the economic and military development of its adversaries.[24]

Securing the cooperation of all potential alternate suppliers is, therefore, crucial for the policy to be successful.[25] As a result, a primary objective of any such policy is to secure international corporate and national government participation.

The targets of U.S. export control enforcement efforts include any actor that can provide a targeted state with goods or technology restricted by U.S. export control regulations. The cases discussed below involve states and firms involved in a variety of industries ranging from machine tools manufacturers to advanced electronics and telecommunication companies.

Critics have argued that economic sanctions cannot be considered the principal factors behind U.S. influence over these actors because the U.S. government compromised at times for the sake of broader strategic objectives such as alliance cohesion by allowing violations and not using economic sanctions to punish offenders. Michael Mastanduno argues, for example, that congruent interests rather than economic coercion can explain variations in the enforcement of export control policies.[26] Cases involving congruent interests, or compromise on the part of the United States regarding the enforcement of its policies, are, however, not of interest in this study. All of the cases discussed involve discordant rather than congruent interests. And all involve U.S. efforts to use economic sanctions as a means of getting others to do something they would not otherwise have done.

U.S. efforts will be considered "successful" when the items it is seeking to control are not exported by the firms or countries in question, regardless of public statements or legislation reflecting discontent. American efforts to control these actors will be considered "unsuccessful" when the items the United States seeks to control are exported to third parties. However, they will also be considered "successful" if, when a violation is detected, the American government is able to punish the firm or individual that violated its policy. Even though this implies that U.S. export control regulations have been breached, the ability to inflict punishment requires the cooperation of host-country governments and represents acceptance of U.S. authority within foreign territory. If the host country government allows the United States to inflict penalties for non-compliance on firms operating abroad, then the host country government has consented to U.S. authority and granted legitimacy to U.S. actions.

C. Means of Enforcement

The United States has three primary means of securing the participation of allied governments and firms in its embargo. First, it can attempt to persuade the others that its restrictions are an appropriate and necessary response an external threat. Using bilateral and multilateral fora, the American government tried to obtain voluntary compliance and support from its allies and the international business community for restrictions placed against the former Soviet Union, China, Cuba, Libya, and several other targeted states. These efforts are institutionalized in the Coordinating Committee on East-West Trade (CoCom) which serves as a forum for negotiating, coordinate and monitoring the movement of strategic goods. Second, the United States seeks to prevent violations by both the CoCom controls and its own export control laws through early detection and by closely reviewing license applications.[27] While CoCom members have succeeded in limiting and monitoring certain "strategic" goods, the U.S.

government has consistently maintained, and sought to enforce, a more restrictive set of goods and technology.

Third, when diplomatic persuasion and early detection efforts fail to secure participation in the embargo, the United States government can use positive and negative sanctions to secure compliance. Promises of a government contract or access to sophisticated technology, such as the Strategic Defense Initiative (SDI), can be effective positive incentives for participation in American policy initiatives.[28] Alternatively, threats may be used to enforce compliance. The United States has sought to deter violators by demonstrating its willingness to aggressively use criminal and Administrative sanctions available under the Trading with the Enemy Act and the Export Control and Administration Acts.[29]

The backbone of American threats against firms operating abroad involves the possibility of placing non-cooperative firms or individuals on the Economic Defense List (also known as the Gray List) and "Atlas" (also known as the Black List).[30] The lists effectively terminate access to all American suppliers and the American market. These lists provide a means of influencing firms at home and abroad without formally extending United States regulations beyond its borders. The denial lists are maintained by the Department of Commerce and apply only to the export of goods from the United States, and, therefore, do not "legally" extend abroad, though they do have an extraterritorial effect. Yet, it is illegal for an American company to conduct business with any firm which appears on these lists. As a result, threatening to sanction a firm by placing it on the Gray or Black Lists provide the American government with a very potent means of exploiting foreign dependence on American suppliers or access to American markets.

IV. Methodology

The hypotheses are first tested using logit analysis of 40 U.S. attempts to use sanctions as a means of implementing its export control policy aborad against the interest of the actors in question. These analyses provide a good initial test of the proposed theories, however, due to data limitations they estimate dependence using data about trade between industrial sectors rather than between individual firms. To compensate for this level of aggregation, the statistical analyses are conducted a second time relying on subjective, firm-level data. In addition, the statistical findings are supplemented with a comparative analysis of several prominent cases. The combination of these analyses provides a more comprehensive analysis of the causal links between the use of economic sanctions, firm dependence and the success of U.S. influence attempts than any one method alone.

A. Variable Definitions

Operationalization of Dependence

As presented in Table 1, dependence is a function of two factors: the proportion of trade accounted for by the Enforcer, and the availability of alternate suppliers. The proportion of a country's exports in a particular industrial sector, (P_x), that are accounted from by enforcer, the

United States in this study, is an aggregate indicator of reliance on access to the its (American) consumer market. Similarly, the proportion of a country's imports in a particular industrial sector that come from the United States, (P_m), is an indicator of reliance on American suppliers.

The validity of this indicator is based on the assumption that firms and states in question are dependent on external, rather than domestic, markets and suppliers. Adopting the rational economic actor assumption, it can be assumed that external suppliers and markets are the most cost effective available or they would not be used in the first place. This assumption does not, however, imply that domestic alternatives cannot be found. To verify firm dependence on external suppliers and markets, detailed analyses of several cases are included in this study. The cases serve to verify that the actors perceived themselves to be dependent on U.S. suppliers or the American consumer market, and altered their behavior as a result.[31]

An actor's proportion of sectoral trade with the United States (P_m, P_x) may range from zero to 100%. If the proportion of trade is low, the actor does not rely heavily on U.S. suppliers or access to the American consumer market. As a result, the actor is not dependent on trade with the United States. If, on the other hand, the proportion of trade is high, then the actor may be dependent on the United States. The degree of the actor's dependence on trade with the United States becomes a function of the availability of alternate suppliers or markets for its goods.

The second component of dependence is the availability of alternate suppliers. Albert Hirschman, and later Orris Herfindahl, devised an index of industrial concentration which is particularly useful in this regard.[32] The Hirschman-Herfindahl index can be applied to both imports and exports of a particular firm or industry as a general indicator of the availability of alternate international suppliers or markets.

The Hirschman-Herfindahl index (HH Index) of trade concentration can be characterized as:

Hirschman-Herfindahl Index of Trade Concentration

$$(1) \qquad HH = \sqrt{\Sigma(\alpha_i/A * 100)^2}$$

where α_i = exports or imports of each firm and $A = \sum_{i=1}^{n} \alpha_i$ and n is the number of actors

The index can take over values ranging from 1/n to 100. This study uses a standardized form of the Hirschman-Herfindahl index to avoid sensitivity to the number of actors in each case. The

standardized Hirschman-Herfindahl index becomes:

Standardized Hirschman-Herfindahl Index

$$(2) \qquad HH_{standardized} = \sqrt{\frac{(HH - 1/n)}{(1 - 1/n)}}$$

The standardized version of the Hirschman-Herfindahl index ranges from 0 to 100.[33] Unless otherwise stated, all references to the Hirschman-Herfindahl index (HH) refer to the standardized form of the index.

The higher HH, the more concentrated the distribution of exports or imports in the international system. The value of 100 indicates the presence of a single producer or purchaser -- no alternate suppliers or markets are available; the value of zero indicates that exports and imports are distributed uniformly among all actors in the system -- alternates are readily available, no market or supplier dominates the industry. ConM represents the concentration of world imports (markets) in a particular industry, and ConX represents the concentration of world exports (suppliers) in a particular industry. For example, a value of ConM = 100 indicates that there is only one market for goods in question. Controlling access to such a market can provide a potent source of influence over actors that wish to sell those goods.

Trade concentrations are calculated using aggregate national trade data broken down by industrial sector using Standard International Trade Classifications (SITCs), rather than using trade data from individual firms. Many production figures, including import and export volume and levels of inter-firm trade for specific firms, are often held as proprietary information and are not accessible to the public. This is particularly true when the firms are involved in the production of goods or technology that may have implications for national security. Since consistent, standard production and consumption figures are not available for all of the cases discussed below, aggregated data is used for the statistical analyses. In the next section, comparative case analyses of several cases where firm level data are available are used to supplement aggregated findings and compensate for this limitation.

Competing Independent Variables: Economic and Military Hegemony

The measurement and operationalization of hegemony have been criticized and debated almost as much as the definition of "hegemony" itself. To avoid creating further debate, indicators of hegemony are adopted from current work in the field.[34] For the purposes of this analysis, hegemony is broken down into two components representing the economic and military characteristics traditionally associated with the concept.

The economic component of hegemony is defined in terms a nation's position within the international economic system. A nation's position with the international economic system can be

operationalized in terms of the proportion of world trade accounted for by a particular country. The proportion of world trade is defined as the sum of imports to country A and exports from country A divided by total world exports and imports.

The Economic Component of Hegemony

$$(3) \quad \text{Size} = \frac{\text{Imports to Country A} + \text{Exports from Country A}}{\text{Total World Imports} + \text{Total World Exports}}$$

This indicator is equivalent to the economic "Size" variable used by David Lake in his discussion of British hegemony at the end of the 19th century.[35] Alternatively, relative Gross National Product (GNP) or Gross Domestic Product (GDP) could be used as indicators of national size. For the purposes of this study, proportion of world trade rather than GNP or GDP was chosen as an indicator of size in order to maintain consistency among the data sources used to calculate hegemony and those used to calculate dependence.

Relative productivity is also commonly associated with economic hegemony. As argued by David Lake, however, this aspect of hegemony is difficult to operationalize as there are not accepted definitions of productivity especially when used for comparative purposes between different countries.[36] Accepting potential problems with the index, relative GNP per capita (GNPPCP) is used as an indicator of relative productivity.[37]

As represented by Robert Gilpin, another groups of scholars emphasize political-military power as the primary indicator of political power and influence a state possesses in international politics.[38] Most of these studies define military hegemony in terms of a combination of the following factors: the relative number of armed forces, relative military expenditure, and nature of national weaponry. For the purposes of this analysis, the military component of hegemony is operationalized in terms of the proportionate size of a state's military expenditure (MILEXP) in comparison to the total military expenditure of all members of its alliance.[39]

The Intervening Variable: Host Government Intervention

Host government intervention is an intervening variable between dependence and implementation. Successful implementation requires the cooperation of both firms operating abroad and the national governments of the countries in which the firms operate. National governments may either challenge or acquiescence to U.S. attempts to implement its policies within their territories. If the host country's government acquiesces to U.S. policy, then firm responses and, consequently, successful implementation will remain a function of the firm's dependence of the American market or American suppliers. Inaction or lack of specific action on the part of the host country has the same effect as acquiescence and will therefore be considered as such. The host country's government may, however, choose to challenge the extraterritorial extension of U.S. policy. On its own initiative or at the request of its firms, the host government

may enact national legislation to forbid the implementation of U.S. policy initiatives. Such legislation represents an assertion of national sovereignty that can effectively negate the direct effect of dependence on the implementation of U.S. policy abroad. As a result, regardless of firm preferences, host government intervention against the United States can effectively challenge American influence attempts within its national borders.

B. Case Selection

U.S. export control cases are used to examine the effectiveness of economic sanctions for three primary reasons. First, export control policy directly affects the economic and military security of all states involved. The enforcement of this policy against the interest of the states involved challenges their sovereign autonomy by asserting control over actors within their borders. Enforcing this policy successfully, therefore, represents a potent exercise of political power. Second, the Executive branch of the United States has the authority to manipulate positive and negative sanctions without consulting other branches of the government.[40] Third, export control policy has a long historical record, and it remains a key component of U.S. foreign economic and security policy.

The cases selected for analysis clearly represent only a subset of the actual cases of American influence in the export control arena. U.S. export control policy involves issues of national security as well as national economic policy. As a result, data from the majority of national, bilateral and multilateral negotiations surrounding these cases are confidential and not available in the public domain. Consequently, only those cases which have been discussed in the scholarly or popular presses are available for analysis.

It is always important to consider the cases not analyzed because of the counter-factual problem -- the dog that didn't bark. However, the available data should be skewed in a manner which challenges rather than compliments the primary hypothesis. In situations where conflicts of interest between U.S. export control authorities and local actors exist and are publicized, national governments should be more likely to challenge United States infringements on their sovereignty than when this is not the case. As a result, using these limited data, one would expect to find a larger percentage of cases resulting in failed U.S. influence attempts than in the general population of export control cases.[41] This trend is supported by the assumption that most unreported cases tend to favor the United States, therefore biasing the available data against it. Consequently, it is assumed that these cases will tend to underestimate the extent of U.S. influence and can consequently be taken as valid indicators of U.S. influence when the United States is successful. They might even be considered "crucial cases" for the study of state power within the Western alliance.

V. Statistical Analyses of U.S. Influence Attempts, 1949-1988

This section presents statistical analyses of U.S. efforts to influence states and firms operating abroad from 1949 through 1988. Models of the proposed hypotheses are presented, and the expected affects of each variable in the model on the likelihood of U.S. influence is

analyzed. The models are then tested using logit analyses of 40 U.S. influence attempts. Predictions from these analyses are compared with the actual outcome of the cases, and the proposed and competing hypotheses are evaluated in terms of the results. Tables presenting variable definitions, a summary of the data, and supplemental analyses are included in the Appendix.

A. The Model

The purpose of this project is to determine the conditions under which one state can use economic sanctions to influence the activities of actors and resources across international borders. This is done by identifying the conditions under which the United States has been able to implement its export policy abroad against the interests of its allies and the firms operating within their borders. The primary hypotheses predict that U.S. influence attempts to assert its export control policy abroad are most likely to succeed if the industrial sectors affected by the policy are dependent on American suppliers or access to American markets, than if they are not; regardless of U.S. economic or military hegemony.

The general equations linking dependence, hegemony, host government intervention and success is as follows:

(4) $\textbf{Success} = a + b_1 \text{ Dependence} + b_2 \text{ Hegemony} + b_3 \text{ Host Government Intervention} + e$

(5) $\textbf{Host Government Intervention} = a + b_1 \text{ Dependence} + b_2 \text{ Hegemony} + e$

Expectations are that b_1 and b_2 in equation 5 are positive and b_3 is negative. As dependence on the United States increases, the likelihood of a successful U.S. influence attempt grows. If U.S. hegemony declines, or host governments intervene on behalf of their firms, the likelihood success decreases. In equation 6, b_1 is expected to be positive and b_2 negative. Host government intervention against the United States becomes more likely as dependence decreases or as U.S. hegemony declines.

Initial analyses indicate a strong relationship between dependent and independent variables as predicted by the hypotheses outlines above. Correlation matrices presented in Table 3 indicate a large, positive relationship between all indicators of dependence (Market1, Supply1, ConM, ConX, Px, Pm, ConM * Px, ConX * Pm) and the successful implementation of U.S. policy (SUCCESS). They also indicate a large negative relationship between these indicators and the likelihood that host governments will intervene against the United States on behalf of their firms (GOVINT). At the same time, there is a strong negative correlation between host government intervention and the likelihood of success ($r = -.7455^{**}$), suggesting that host government can effectively challenge U.S. influence attempts, should they chose to act. The correlations between the independent variables is less that $r = .48$. This indicates that multicollinearity among the independent variables is not a problem in the models presented below.[42]

B. Specification of the Equation

Maximum likelihood estimations using Logit analysis provide probability estimates for the likelihood of a successful U.S. influence attempt. Logit, rather than ordinary least squared (OLS) regression analysis, is used to evaluate the data because the dependent variable is dichotomous.[43] U.S. influence attempts are considered either successful (SUCCESS = 1) or not successful (SUCCESS = 0). Logit analyses provide estimates of the probability that the United States will be able to influence its allies and their firms successfully, (SUCCESS = 1).[44]

Each model is calculated twice using different indicators for firm and state dependence on the United States. First, aggregate trade data within specified industrial sectors are used to estimate dependence. Firm or state dependence results when both the proportion of trade with the U.S. is high and the world concentration of trade is

high (availability of alternate suppliers is low). Therefore, dependence is coded as an interaction term combining the effects of P_x and ConM (or P_m and ConX).

Use of aggregate trade data as indicators of dependence has a potential limitation because it does not take the suppliers and markets used by specific firms into account. To compensate for the potential problems associated with this assumption, the models are estimated a second time using the perceptions of corporate and national decision makers to determine firm and state dependence on American markets and American suppliers.

In the second set of equations, actors perceptions of their dependence on the United States, informed from a detailed study of case histories, are coded as indicators of firm and state dependence. Dependence on access to the American market, (MARKET1), and dependence on American suppliers, (SUPPLY1), are coded dichotomously as High or Low. All other variables are remain the same. Comparing the results from these two data sources enables the researcher to evaluate the predictions based on aggregate trade flows against the perceptions of the actors themselves.

U.S. hegemony is broken down into two components. The military component of hegemony, (MILEXP), is represented by the proportion of U.S. military expenditure in the Western alliance. The economic component of hegemony (SIZE) is the combination of U.S. exports and imports as a proportion of total OECD exports and imports. The relative productivity (GNPPCP) is also considered a component of economic hegemony.

Finally, the hypotheses argued that host government invention represents an intervening and suppressor variable between dependence, hegemony and success. Host government intervention, (GOVINT), is coded dichotomously as Yes or No. Subsidiary hypotheses about the affects of dependence and U.S. hegemony on host government intervention are also tested.

C. Data Analysis

Expectations of the Results

The primary hypothesis argues that United States' influence attempts are most likely to succeed if actors in the industrial sectors affected by the policy are dependent on American suppliers or access to American markets, regardless of changes in hegemony or the distribution of global resources. Consequently, the statistical analyses of U.S. influence attempts should indicate a positive relationship between foreign dependence on American markets and American suppliers and the success of U.S. influence attempts.

Logit Models of Success:

$$(7) \quad l_{suc} = a + b_1 P_m{*}ConX + b_2 P_x{*}ConM + b_3 MILEXP + b_4 SIZE + b_5 GNPPCP + b_6 GOVINT + e$$

Using subjective, firm-level data, this equation becomes:

$$(8) \quad l_{suc} = a + b_1 MARKET1 + b_2 SUPPLY1 + b_3 MILEXP + b_4 SIZE + b_5 GNPPCP + b_6 GOVINT + e$$

Logit Models of Host Government Intervention:

$$(9) \quad l_{gov} = a + b_1 P_m{*}ConX + b_2 P_x{*}ConM + b_3 MILEXP + b_4 SIZE + x_5 GNPPCP + e$$

Using subjective, firm-level data, this equation becomes:

$$(10) \quad l_{gov} = a + b_1 MARKET1 + b_2 SUPPLY1 + b_3 MILEXP + b_4 SIZE + b_5 GNPPCP + e$$

A subsidiary hypothesis predicted that firms would respond more readily to dependence on market access, whereas states are more likely to respond to conditions of dependence on access to foreign suppliers. One would expect the models to indicate that dependence on markets access has a strong, positive effect on U.S. influence over firms. At the same time, one would expect the models to indicate that dependence on American suppliers should have a strong, negative effect on host government intervention against the United States. Finally, the hypotheses predict that the effect of American hegemony on the likelihood of success will be minimal.

Analysis of the Models

Sanctions and Firm Action

The results of an initial estimate of success as a function of firm dependence are presented in Tables 4a and 4b. In both equations, the t-statistics indicate that dependence on U.S. markets and as well as some components of hegemony are positive and significant. Regardless of which indicators of dependence are used, the coefficients indicate that when dependence on U.S. markets increases, the likelihood of success of U.S. sanctions increases as well. They also indicates that the greater the relative size of U.S. trade in a particular sector, the greater the likelihood of successfully influencing firms in that sector.

The sectoral estimates (table 4a) diverge somewhat from the subjective firm level estimates (table 4b) regarding the effect of relative productivity and military expenditure on success. The aggregated equation shows a positive relationship between relative productivity (GNPPCP) and success, and a negative relationship between military expenditure and success. This indicates that as relative productivity of the influencer increases, the likelihood of its success increases as well; however, it also implies that relative increases in American military expenditure actually decrease the probability the U.S. government will be able to used economic sanctions effectively. The firm-level equation, however, shows a negligible relationship between relative productivity and military expenditure.

The results from these initial estimates support both the hypotheses that firm dependence on access to foreign markets, and economic hegemony, at least as represented in terms of the relative size of trade, increase the probability that economic sanctions will be successful. They, however, present mixed results concerning the link between firm dependence on foreign suppliers and the likelihood of success. Over all, the sectoral level predictions of success are correct 62.5% of the time, and correlate highly with the actual outcome ($r = .6351$); the firm level predictions are correct 61.9% of the time, and also correlate highly with the actual results ($r=.5522^{**}$). Furthermore, the predictions of the two equations correlate highly ($r = .3688^{**}$), indicating that the aggregate estimates provide a reasonable first cut predictions of firm perceptions of dependence.

A subsidiary hypothesis predicted that host government intervention would act as a suppressor variable, mitigating the effects of dependence on firm action. To test this hypothesis, these estimates are recalculated controlling for host government intervention. The equations are first estimated again without including host government intervention (Tables 5a and 5b), and then for cases including only cases where the host government intervened (Tables 9a and 9b, in the appendix) and then where it did not (10a and 10b, in the appendix).

The varying results in Tables 5, 9 and 10 confirm the hypothesis that Government Intervention acts as a suppressor variable, mitigating the effect of

dependence on firm action. As is characteristic of a suppressor variable, when only cases of host government intervention are included, all other independent variables become insignificant; however, when cases where of host government intervened are excluded, the significance of competing independent variables increases. In order to maintain the largest number cases possible, while taking the effect of government intervention into account, GOVINT is removed from the equation in Tables 5a and 5b.

When government intervention is removed from the model (Table 5a and 5b), firm dependence on markets and the over all size of U.S. trade become increasingly significant. In addition, the significance of firm dependence on external suppliers increases dramatically. Sectoral and firm-level estimates diverge again, however, on the significance of relative productivity (GNPPCP) and military expenditure (MILEXP).

These estimates indicate that from both a sector specific and subjective firm-level analysis dependence on access to foreign markets and the relative size of trade within a particular sector have a strong, positive and significant effect on the likelihood that economic sanctions can be used to alter firm behavior. The effects of firm dependence on foreign suppliers, relative productivity, and military expenditure have mixed results. Finally, host government intervention is very influential and can apparently mitigate the effect between dependence and the economic component of hegemony and firm action.

Sanctions and Host Government Intervention

The effects of dependence and economic and military hegemony on host government intervention against American initiatives are presented in Tables 6a and 6b. The findings from both equations indicate that the likelihood of host government intervention decreases as dependence on American suppliers or access to American markets increases. This supports the primary hypotheses that as national dependence on the United States increases, host government intervention becomes less likely. The models also support the subsidiary hypothesis that, in contrast to firms, national governments tend to be less concerned about access to foreign markets for their firms than in securing the supply of resources that are necessary for their economic and military security. The estimates indicate that dependence on American suppliers has a greater and more significant effect on the likelihood of host government intervention than dependence on market access.

The impact of American hegemony on the likelihood of host government intervention is mixed. As predicted by theories linking economic and military hegemony to political influence, increases in the relative size of U.S. military expenditures or the relative size of U.S. trade decreases the likelihood that host government would challenge the United States on behalf of their firms. Further, both models indicate that increases in relative productivity in the United States tends to increase the likelihood that host governments would intervene on behalf of their firms.

This finding may appear to be counter intuitive, since theories of economic hegemony would predict that increases in economic productivity should lead to a general increase in hegemony. However, the finding is consistent with the common policy of protecting domestic firms that are not competitive against foreign competition.

D. Evaluation of the Models

The models are evaluated in terms of their predictive capacity. To test the predictive value of these estimates, the predicted probabilities of success are compared to the actual outcome. In all cases, the correlation between the predicted probability and the actual outcome is high. The initial sector level estimate, Table 4a, is correct in predicting 62.5% of the cases, and its predictions correlate strongly with the actual results ($r = .6351$). The initial firm-level estimate is correct 61.9% of the time, and its predictions also correlate strongly with the actual results ($r = .5522^{**}$). When host government intervention is removed from the equation, tables 5a and 5b, the number of correct predictions remain the same, and the correlation between the predictions and the outcomes remain high, ($r = .4848^{**}$, and $r = .4406^{**}$, respectively).

Finally, in all cases, predictions from equations using sectoral level data and those using firm-level data are highly correlated. Correlation between equations range from $r = .3688^{**}$ between equations 4a and 4b, to $r = .5273^{**}$ between equations 5a and 5b, to $r = .7752^{**}$ between equations 10a and 10b. This indicates that use of aggregate trade data provides a good indicator of firm perceptions of dependence. This is particularly useful, as it is often difficult to obtain the data necessary to determine actors' perceptions of dependence directly.

To test the predictive value of the models of host government intervention, the predicted probabilities of success are compared to the actual outcome. In all cases, the relationship is strong. The correlation between the probability of host government intervention estimated by the model using aggregated trade data, Table 6a, and the outcome is $r = .4740^{**}$. The correlation between the probability of host government intervention estimated using actors perception of dependence, Table 6b, and the outcome is $r = .3503^{*}$. These findings indicate the models provide good predictions of the likelihood of host government intervention. The predictions made by two models are themselves moderately correlated, $r = .5479^{**}$. This indicates that use of aggregate trade data provides a reasonable indicator of state perceptions of dependence.

The models developed in this article provide reliable predictions of the likelihood that U.S. influence attempts over states and firms operating abroad will be successful. The statistical analyses suggest that dependence on American suppliers and access to American consumer markets in certain industries has enabled the United States to implement its export control policy abroad, and can be used by all states as a source of political influence.

VI. Short Case Studies of U.S. Influence Attempts, 1949-1988

This section provides a brief synopsis several well publicized disputes over U.S. export control policy. The cases are intended to supplement the statistical analyses by highlighting the causal link between dependence and political power. They also provide a basis for the estimates of dependence used in the firm-level analyses in the preceding section. The cases highlight the powerful impact of positive and negative economic sanctions, the crucial role of alternate suppliers and alternate markets, and the effectiveness of host government intervention against the United States.

A. Dependence and the Successful Use of Sanctions

The Battle Act, 1951 and 1954

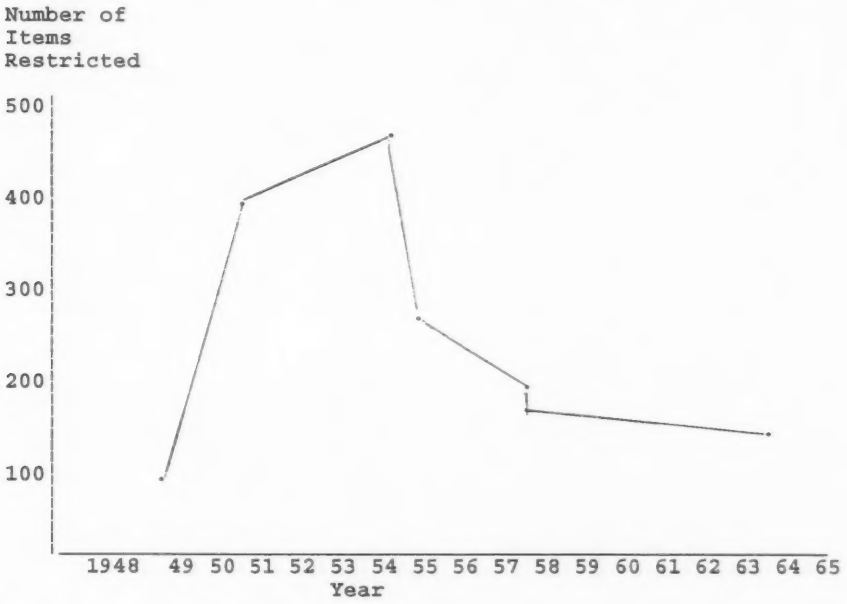
One of the earliest and most often cited examples of the success and limitations economic sanctions in the export control arena involved the American threat to cut off Marshall Plan aid to any country which did not comply with its post-war export control policy.[45] In order to secure allied cooperation in the early years of CoCom, Laurie Battle led the American Congress in instituting the Mutual Defense Assistance Control Act of 1951, known as the "Battle Act." The goal of the Battle Act was to enforce compliance by prohibiting "all military, economic and financial U.S. aid to any nation which permitted the shipment of arms, ammunition, etc., to any nation or combination of nations threatening the security of the United States."[46]

In his seminal work on CoCom, Adler-Karlsson convincingly argues that, "The answer [regarding European cooperation] is clearly to found in the American threats to cut off aid in cases of non-compliance."[47] This argument is based on a strong correlation between European cooperation and the amount of Marshall plan aid relative to trade with the Eastern bloc.

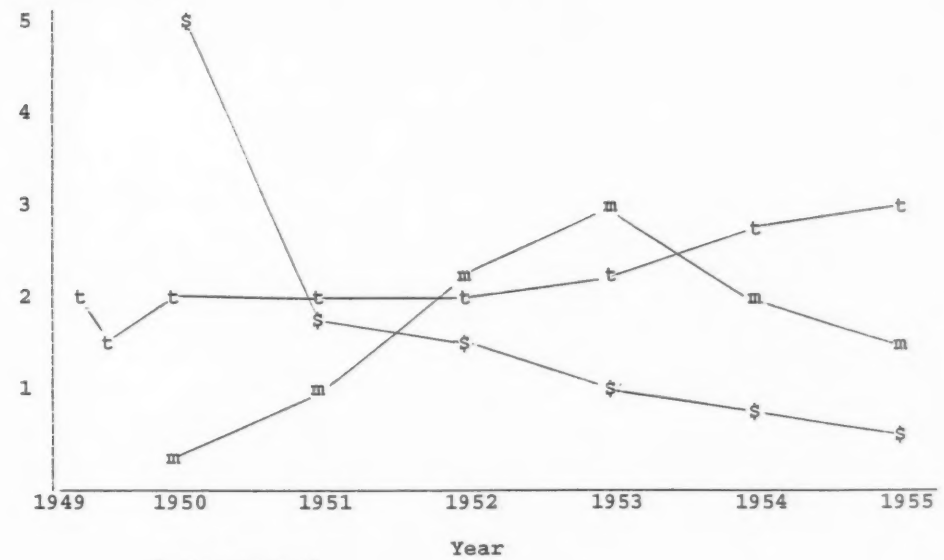
Allied compliance in the early 1950's can best be explained as a result of the fact at that time the Europeans were far more dependent on U.S. aid than East-West trade. The allies "buckled under U.S. pressure" until about 1953.[48] When economic recovery and trade with the East began to lessen European dependence on the Marshall plan, the level of their compliance diminished and open conflict erupted. As Figures 1 and 2 demonstrate, the data compiled by Adler-Karlsson shows a strong relationship between economic dependence and allied cooperation.

This result is at odds with models of political influence which emphasize the distribution of economic and military resources in the alliance. During this period, despite perceived changes in the international distribution of military resources between the Superpowers, the United States maintained unquestioned economic and military hegemony within the Western alliance. If the comparatively large possession of

Figure 1 Approximate Number of Items on the Co-Com Lists



U.S. Aid compared with East-West Trade in Europe



$ - U.S. economic aid
m - U.S. military aid
t - East-West trade turnover (exports+imports)

Source: Adler-Karlsson, Western Economic Warfare, (Sweden: Almquist & Wiksells Boktyckeri, 1968), p. 146.

resources is sufficient to entice or coerce others into submission, one would predict that the United States should have been able to maintain its control over the allies. If, however, allied actions are a function of their dependence on particular resources provided by the United States, then changes in the supply of particular resources or changes in their need or dependence eon them will affect their behavior.

The graphs indicate the number of restricted items on the CoCom lists. The United States maintained a more restrictive domestic list and continually pushed the allies to adopt more stringent controls on a larger number of items. The number of items on the CoCom lists will, therefore, be treated as an indicator of U.S. influence. The lower the number, the less influence the U.S. was able to bring to bear. From the graphs of restricted items and U.S. aid relative to European trade, it would appear that U.S. power over its allies peaked between 1951 and August of 1954 and declined thereafter.

Despite a unquestioned American economic and military hegemony following World War II, American influence over the actions of its allies was largely determined by their dependence on the United States. As long as the Allies remained dependent on Marshall Plan aid, they participated in the embargo. As the costs associated with losing the supply of aid diminished relative to the benefits of trading with the East, the American government's ability to entice or coerce others to cooperate diminished.

Others have argued that the variation in European compliance can be more fully understood in terms of changing interests on the part of the Europeans.[49] Despite this criticism, it remains very plausible that a conflict of interest was present at in 1949 as continues to be present. The European governments maintain a distinctly different interpretation of the value of the embargo from the United States. Economically, the Western European had a much stronger interest in maintaining their historical trade links with the Eastern bloc. Even though trade with the East was very low following World War II, trade was and is seen both as a source of future economic strength and a symbol of political cooperation. Politically, the European were incensed by the boldness of U.S. dictates and unilateral actions. The Battle Act was interpreted as a direct infringement on national sovereignty by the British, as dangerously over zealous by the French and as a severe economic threat by Germany. Equally important, the embargo was not seen by the Europeans as an appropriate means of controlling Soviet expansion. It was considered ineffective at best and destructive at worst. Despite the ability of CoCom members to agree on limiting a limited set of goods, the number of goods to be restricted has been a source of dispute since CoCom was formed.

European reactions to the Battle Act reflected very much the same anger and resentment their present counterparts displayed in during the 1982 Pipeline crisis and other disputes, discussed above. In his seminal work on the subject, Adler-Karlsson cited the *Economist* as an example of European sentiment arguing that the Battle Act, "implied an American veto over the trade policies of a score of countries," and that such a policy was "incompatible with the free and equal partnership between the

United States and its allies."[50] Like their governments, the business community considered the Battle Act a direct challenge to their international activities. Most importantly, the Act violated the international norm of *pacta sunt servanda* by requiring firms to stop all shipments of embargoed goods or forsake aid. As Adler-Karlsson reiterates, "opposition to the embargo was . . . severe and many industrialists bowed only 'reluctantly' and with 'dismay and resentment' to the embargo regulations."[51]

Given this conflict of interests, economic dependence and the threat of economic sanctions reflected in the Battle Act provide a strong plausible explanation of variations in European compliance in the early 1950s.

The Trans-Siberian Pipeline and Alsthom-Atlantique, 1982

The Trans-Siberian pipeline incident in the early 1980s is often sighted as an example of the limits of economic sanctions and the decline of U.S. influence in the Western alliance. A closer analysis of this crisis, however, reveals that American influence was not completely absent. Firms that were highly dependent on access to American markets to export their goods, and to a lesser extent, dependent on the supply of technology from U.S. firms, altered their behavior as a direct result of U.S. actions.

Beginning in 1982, the Reagan administration sought to control the activities of firms involved in the construction of the trans-Siberian pipeline by enforcing its export control policy at home and abroad. This policy restricted the sale of oil and gas equipment and related technology to the Soviet Union by corporations within and outside of U.S. territory. In what became the "most violent dispute over extraterritoriality in the history of American trade controls,"[52] Britain, France and Canada instituted national legislation forbidding any firms located within their borders from abiding by United States' law. Although the export embargo affected only a small number of firms and a relatively narrow set of economic and security concerns, the allies were willing to challenge the United States in order to preserve their sovereign integrity. Despite the success of European efforts to formally block American initiatives, the U.S. government was able to control the actions of certain important firms throughout the crisis by threatening the use of economic sanctions.

A crucial component of U.S. influence was the result of its ability to cut off foreign access to the American firm General Electric. General Electric built the rotors, nozzles and sator blades necessary for the construction of the turbines used to pump natural gas throughout the pipeline.[53] Many companies involved in the pipeline project, including AEG-Kanis, Alsthom-Atlantique, John Brown and Nuovo Pignone, relied on equipment provided by General Electric for future sales of products containing GE parts, valued at over $175 million.[54] By the time the initial sanctions were imposed, GE had already shipped 23 rotor sets to Europe. This provided enough material for European firms to produce 23 of the 41 compressor stations required

along the pipeline. Lacking additional supplies from GE, the pipeline would be limited to about 70% of capacity with no backup or replacement equipment.[55] In order to build additional compressors, firms that relied on American made materials and components had to find alternate sources of supply.

One option involved the French firm Alsthom-Atlantique. Initially, Alsthom-Atlantique appeared to be an ideal alternate supplier of the equipment embargoed by General Electric. Alsthom-Atlantique was the only manufacturing associate of General Electric that possessed a license to make the rotor kits the pipeline needed. Further, it had already agreed to produce 40 spare rotor kits for the Soviet Union by 1984.[56]

Alsthom-Atlantique could replace the equipment embargoed by GE. Supplying the rotors would require it to build a new production plant or re-tool an existing one. This required a large amount of capital, but, once the initial investment was made, being the sole producer of the rotor kits for the pipeline would be highly profitable. A more important consideration was, however, the potential long term costs of alienating GE. Alsthom-Atlantique depended on continued access to General Electric's equipment and technology to remain financially viable. Furthermore, the parent company of Alsthom-Atlantique, Compagnie Générale d'Electricité, was also one of the largest French investors in the United States. It too feared retaliation if its subsidiary did not toe the Washington line. Retaliation would cut off access to the American market which accounted for a large proportion of Compagnie Générale d'Electricité's current and prospective business.[57]

Alsthom-Atlantique's dependence on General Electric gave the Reagan Administration leverage over corporate actions. If Alsthom-Atlantique, and others under similar circumstances, chose to violate U.S. policy, they would breach their American contracts and violate American law. In addition to the standard criminal fines and imprisonment, such actions would place them on the "Gray" or "Black" List, make it illegal for any American company to conduct any business transactions with them.

Citing "the obvious political risks" and the importance of their relationship with GE, Alsthom-Atlantique declined to accept the role of alternate supplier.[58] Alsthom-Atlantique's decision not to produce additional rotor kits was based on its dependence on a stable future relationship with General Electric. American threats against Alsthom-Atlantique served an additional purpose. By controlling Alsthom-Atlantique, the U.S. government eliminated the most cost-effective alternate supplier of compressor equipment.[59] Aside from Alsthom-Atlantique, all additional alternate suppliers would require project alterations that would complicate construction, increase costs of the project and consequently delay construction. By exploiting Alsthom-Atlantique's dependence on access to American technology and access to the American market, the U.S. government was able to eliminate the most cost-effective alternate supplier of the embargoed goods.

L.M. Ericsson, 1984

The Swedish telecommunications firm, L.M. Ericsson, suspended its efforts to sell an advanced telephone exchange system to Bulgaria in August of 1984. The majority of L.M. Ericsson's western economic rivals had withdrawn their contract bids in January as a result of an agreement within CoCom to tighten its controls on the export of high technology to the East Bloc.[60] Sweden is not a CoCom member and is not under agreement to abide by its decisions. However, in practice, the CoCom decision had a direct effect on the Swedish company's actions. U.S. and CoCom influence is the result of L.M. Ericsson's dependence on the supply of American parts for its most sophisticated systems. L.M. Ericsson reported 25 billion crowns ($3 billion) of sales in 1983. The majority of these sales involved its principal and most sophisticated product, the AXE digital exchange system, which depended on American made components.[61] As Magnus Lemmel, vice president, stated without continued use of U.S. components and the permits to use them, "we will not be able to deliver our latest technology to Eastern Europe."[62]

In addition to being dependent on American suppliers, potential access to the American consumer market also affected L.M. Ericsson's decision. The Swedish telecommunications market is small and relatively open. Its industries produce primarily for an export market. For example, approximately 80% of sales from Ericsson and the Dutch firm Phillips come from abroad.[63] In 1981, Sweden accounted for 16% of world exports in telecommunications equipment and, following Japan, it had the second largest trade surplus in telecommunications equipment, $711 million.[64] Deregulation of the American telecommunications industry and the divestiture of AT&T in 1983-1984 opened the American market to foreign competition. Between 1983 and 1984, U.S. imports of telecommunications equipment rose 38%, to $7.6 billion.[65] Japan is the dominant beneficiary of this new market, but exports to American consumers as a proportion of telecommunications exports have risen in Sweden, France, Great Britain, and Germany since 1984. Threatening to cut off access to this new market represents a source of political influence.

German Industry and S.D.I. Case, 1986

As with the Marshall Plan in the early 1950's, positive as well as negative sanctions are effective forms of political influence. Promising to provide something that cannot be secured from any where else, be it aid or technology, is as effective as threatening to cut off access to similar items. For example, in March of 1986, the United States and Germany signed an agreement for German participation in American Strategic Defense Initiative (S.D.I.) projects.[66] A leak in the German press revealed that the agreement included correspondence between Assistant Secretary of Defense Richard Perle and Dr. Lorenz Schomerus, head of trade policy at the West German Ministry of Economy, showing that the German participation in high-technology military research projects in the United States was conditional on the tightening of Bonn's export control procedures and on a bigger role of the West German Ministry of

Defense in these procedures.[67]

The promise of access to SDI technology can be manipulated as a stick as well as a carrot. The difference between a positive and negative sanction is largely a function of the target's base line of expectations. If an ally expects to gain access to SDI technology, the possibility of not gaining access to the technology may be interpreted as a cost or threat. For example, by 1986, the Department of Defense had made agreements to share SDI development and technology with Britain and Israel as well as Germany. The agreements, however, stipulated that continued access to SDI technology required these countries to control the technology in a manner acceptable to the United States:[68]

> . . . the U.S. government has made clear that it will not release its own SDI technology, nor participate in co-development and co-production programmes, unless it is completely satisfied that is allies can protect such technology from the Soviet Union.

As a result, despite verbal protest, the United States has been able to implement its high technology export control policy in Great Britain, Germany and Israel successfully.

B. Dependence, Sanctions and the 3rd Country Problem

The success of U.S. export control policy requires the cooperation of all actors that provide an alternate source of supply of the controlled goods. Even if the United States can secure the cooperation of all CoCom member countries and their firms, the success of its policy can be undermined if non-CoCom sources act as alternate suppliers. It is crucial that the United States secure the cooperation of these "Third Countries" even though they have not formally agreed to abide by the CoCom regulations and are not under any international obligation to do so. If the hypotheses linking dependence and the effectiveness of economic sanctions are correct, then lack of membership in CoCom should not affect the outcome.

Sweden

The Swedish cases of ASEA, Datasaab and Meuller demonstrate the extent and limitations of U.S. efforts to implements its policy in non-CoCom member countries. If the hypotheses linking dependence and political power are correct, then the United States should be as likely to implement its export control policy within CoCom and non-Cocom countries under similar circumstances.

In 1985, Sweden was the only remaining Western country that did not have national laws regulating the export and re-export of Western or American technology. Officially, Sweden maintains a neutral stance and does not take part in embargoes,

and, as a result of several recent highly publicized cases, Sweden has been placed on the Pentagons list of "risk countries."

Datasaab, 1982

In 1977 the Carter Administration refused to grant re-export licenses for electronic equipment needed by Datasaab Contracting AB to complete its shipment of an air traffic control system to the Soviet Union. Datasaab got around the restriction by illicitly smuggling the key components to the Soviet Union during corporate visits. When the violation came to light in 1980, in addition to punishing Datasaab, the United States sought to punish the Swedish government for not controlling its exports by terminating the sale of American Sidewinder missiles. These missiles served as a mainstay of the Swedish air force.

In 1982, to regain access to the American military suppliers, the Swedish Defense Department agreed to establish a covert operation to maintain surveillance over local companies using sophisticated computers. Datasaab, in turn, agreed to pay a $1 million to the United States government.[69] As predicted, threatening to cut off the supply of items considered necessary for national economic or military security gave the United States a potent source of influence over the Swedish government. The *Guardian* summed up the Swedish response:[70]

> Swedish industry is heavily dependent on advanced US electronic components and if these were stopped, the local export market, which accounts for 27% of GNP, would collapse within a few months. Thus the US is able to make its own terms and Swedish industry is being forced, despite official policies of neutrality, to join the blockade and even to submit to "voluntary" control and inspection by Americans. With little fanfare, the [Swedish] Government has put key Swedish companies under military surveillance to satisfy US demands.

Richard Meuller, 1984

Richard Mueller, a German businessman, led a sophisticated smuggling organization that shipped American goods and technology to the Soviet Union throughout the 1970's and 1980's.[71] In November of 1984, West German and Swedish officials intercepted a shipment of high technology goods that Meuller's organization was smuggling to the Soviet Union. The shipment included 50 tons of electronics equipment, making it the largest diversion of restricted American technology ever uncovered.[72] The shipment contained two VAX 11/782 computers produced by Digital Equipment Corporation valued at $4.5 million. These computers are widely used in the U.S. military for tasks ranging from missile guidance to satellite transmission intercepts and are considered very sensitive.[73] The computers had been shipped to Canada without needing any export licenses, then to Europe and eventually

through South Africa and Sweden, and, finally, to Soviet Union.

Even when an "illegal" shipment of goods is discovered, however, the cooperation of allied governments and firms is not guaranteed. As a result of pressure from local businesses protesting trade restrictions, and politicians who wanted to maintain Sweden's neutrality, Sweden withdrew from CoCom in 1968. Consequently, although Swedish authorities were willing to impound Meuller's electronic equipment, they claimed there was no legal basis that enabled or required them to confiscate it.[74]

In order to pressure the Swedish government to confiscate the restricted equipment and then release it to American officials, the United States government threatened to terminate the shipment of American made armaments to the Swedish military for its next generation of fighter aircraft. As a result of the Swedish government's perception of dependence on the continued supply of American products it considered vital to its national security, Prime Minister Olof Palma decreed retroactively that it was illegal to ship "war material" to or from South Africa. The computers and electronic equipment in question were labeled "war material" and impounded. DEC, in turn, bought it. And, while in transit back to the United States, U.S. Customs officials confiscated it as evidence against Mueller.

C. Alternate Suppliers, Alternate Markets and Host Government Intervention

There are a variety of ways in which host country governments can intervene against the United States on the behalf of their firms. The following cases present several strategies followed by host governments, some strategies were effective, others were only of limited success, and some proved costly to the firms they were trying to protect.

I.T.T.-Standard Electric Case, early 1960's

When the supply of particular resources or markets is cut off, firms often seek out alternate sources of supply or alternate markets for their goods. The I.T.T. case demonstrates that under certain circumstances, host country governments can create alternate markets internally. If an alternate sources or an alternate product may be found or developed, then the threat resulting from its stoppage is negated.

In the early 1960's, I.T.T., through its U.K. subsidiary, became entangled in a major dispute with the Treasury Department. Under the Trading with the Enemy Act, the Treasury ordered the U.K. subsidiary, Standard Electric, to cancel the supply of radio equipment already ordered for sale to the British Aircraft Corporation because it was to be installed in planes to be exported to the People's Republic of China. As a subsidiary of I.T.T., the Treasury insisted that Standard Electric of the U.K. was a person "subject to United States Jurisdiction," and as such would be subject to multiple sanctions including the denial of U.S. trading privileges if it failed to comply.[75]

The United Kingdom vigorously protested the notion that Standard Electric was subject to American jurisdiction. The conflict was eventually resolved when the British government supplied the desired radios from its own stockpile and immediately ordered exactly the same sets from I.T.T. so that Standard Electric could replenish its stockpile.

The Viscount Case, 1963

Like the last case, the case of Viscount aircraft demonstrates the lack of dependence and subsequent leverage when alternate sources of certain components are available. In 1963, the United States forbid the use of its radar equipment in British Viscount aircraft ordered for purchase by the People's Republic of China.[76] The prohibition was based on the premise that the radar equipment was produced by a U.S. affiliate and that the export of that equipment violated the American embargo with Communist China.

The British government rejected the U.S. argument and ordered the British affiliate to produce and ship the radar equipment. The aircraft had, however, been designed specifically for the restricted radar system and the company argued that the order could not be filled on time if the system was removed. The United States government stood firm and refused to permit what it considered to be a blatant abuse of its controls. At considerable cost, the British firm eventually redesigned the plane to avoid using U.S. equipment. In this case, the British government effectively cut off the extension of U.S. extraterritorial controls by protecting the domestic production of its radar equipment and planes. It did so, however, at a high cost to the firms involved.

The Ford Case and the Eisenhower-Diefenbaker Agreement, 1958

The Ford case and the ones that follow it the effects and limitations of host government intervention against U.S. export control policy. In this case, Ford of Canada rejected the chance to sell automobiles to China because of pressure from its U.S. parent corporation to abide by the Foreign Assets Control Regulations. The Ford case is important because of the high degree of dependence of Ford on access to the American market, and the large role that the automobile trade played in overall U.S.-Canadian economic relations.

The Ford Case took place against the background of economic nationalism which was stirred up in the Canadian election of 1957. Throughout the election, Canadian public opinion was sensitized to the potential dangers of "excessive control" of the Canadian economy by U.S. parents of Canadian corporations. The case became a symbol of conflict and resentment engendered by the American governments efforts to prevent Canadian affiliates from trading with China.

Following a regional security summit in July of 1958, Prime Minister Diefenbaker and President Eisenhower negotiated an agreement calling for consultation and understanding between governments and firms regarding export control policies.[77] The goal of the agreement was to provide a means for consultation and negotiation in any case where it was believed that US law was blocking the willingness of a Canadian company to fulfill an order. The U.S. Government agreed to deal only with the American parent corporation, it also agreed to entertain requests for exemptions from its policies; however, it reserved the right to impose its prohibitions on the U.S. parents of Canadian corporations unilaterally, without prior consultation.[78] In exchange, Canadian affiliates were given the ability to seek assistance from the Canadian government to obtain a special exemption or waiver of the regulations if its sales were hindered by these restrictions. The Canadian Government agreed not to interfere unless such interference was requested by a Canadian corporation.

The primary limitation to this agreement was that many potential sales to China may have been turned down due to fear of economic sanctions, without ever being raised to the attention of the Canadian Government. Only in those cases where companies went to the Canadian government and where it subsequently made representations on their behalf could the Eisenhower-Diefenbaker agreement have made a difference. The Aluminum Company of Canada cases an indication of the effectiveness of consultation in practice and of the standards which govern its application.

Aluminum Company of Canada Case, 1959

The Aluminum Company of Canada case is an example of the limitations of the Eisenhower-Diefenbaker agreement. This case demonstrates that firms tend respond to their interests and fears of economic dependence even when institutions are established which may mitigate the potential costs of these relationships.

Multinational firms generally try to avoid conflict with their home or host government by not applying for licenses they think will be denied or that could lead to tensions. By avoiding prohibited business and advising their affiliates to do the same, they have done what the United States desired. In essence, due to anticipated reactions of the United States, the United States has in fact succeeded in achieving its goal.

The Aluminum Company of Canada (Alcan) reportedly refused an offer to purchase two thousand long tons of aluminum from China.[79] Alcan relied on the U.S. market for the vast majority of its sales and officially rejected the offer because it feared losing the business from its American customers if it proceeded with the sale.

The sale would have been beneficial for both Alcan and the Canadian economy as a whole. Based on the Eisenhower-Diefenbaker understanding, it was precisely under these conditions that consultations should be held and U.S. policy negotiated. Yet, the presence of the agreement did not alter the corporate decision not to proceed

with the sale. The Eisenhower-Diefenbaker agreement was limited to the extent that it only came into play when the Canadian government interceded on behalf of a company that had already decided to go ahead with a sale and was awaiting export licenses before it did so.

The case of International Computers, Ltd. demonstrates that even when a company requests assistance from its host country government against the United States, assistance may not be forthcoming or, if it is, it may not do what firm desires.

International Computers, Ltd., 1982

In May of 1982 the United States Commerce Department fined International Computers, Ltd. (ICL, later STC ICL) of Great Britain $15,000 for selling a large computer to South Africa. The original transaction took place in 1978 and was carried out with export licenses from the United Kingdom.[80] The Commerce Department claimed, however, that because the computer contained two memory discs built by an American company, CDC Corporation, the sale should not have been completed without appropriate U.S. export control licenses. In addition to the license, the Commerce Department required a full release of all of ICL's major exports from the United Kingdom including the destination, name of the recipient and likely use of the product.

To enforce compliance with its regulations, the Commerce Department threatened to cut off technical supplies to ICL from the United States. ICL requested assistance from the British government and asked that the Department of Trade and Industry (DTI) intervene on its behalf. A letter to Sir Michael Havers, Attorney General of the U.K. sums up the problems faced by British companies confronted with the American restrictions:[81]

> In the event of breach of the regulations by the non US national in their own country the US Department of Commerce has imposed heavy fines and additional conditions.
>
> As the enclosed extract of the 1982 Report of the Export Administration shows clearly, fines have been levied on non US companies, including a fine of $15,000 on the UK company ICL. Currently, a Leeds based Company called Systime Limited faces fines of $400,000, despite its compliance with UK export control regulations. Attached to the fines are conditions, which, in ICL's case, include a requirement to obtain the consent of the Office of Export Administration for import sales transactions involving the relevant computer system.
>
> If the fine is not paid and the conditions not met, orders are made, and names are entered on the US Export Denials list.

Through DTI, the British government responded by providing guarantees to banks for a bail-out package for ICL, but it did not challenge the extraterritorial extension of U.S. regulations on ICL's behalf.

The British government justified its failure to challenge U.S. actions by arguing that DTI's first objective was to save the company.[82] In order to save its only major indigenous computer producer, the DTI was willing to arrange a financing package and accept corporate restructuring that led to a loss of over 10,000 British jobs in the industry.[83] It, however, would not challenge the application of U.S. regulations within its borders. DTI believed that ICL was dependent on the supply of American technology and components and would not survive if that supply was terminated. If provoked, the United States Department of Commerce would likely black list ICL, cutting off its access to American companies and goods. This outcome would violate DTI's primary objective of saving the company and was, therefore, rejected.

A second motivation was a perception of national, as well as corporate, dependence on IBM for the supply of computer components as a base of British economic and military security. With an output more than two and one half times as large as STC ICL, IBM (UK) is the largest manufacturer of computer products in the U.K.[84] The dominance of American firms like IBM and DEC has given the United States a means of controlling the activities of firms operating within Great Britain. Ken Baker, Minister of Information Technology for the Thatcher government, summarized the government's fear of losing access to American computer technology if the American initiatives were challenged. He expressed this concern arguing, "If we are dependent on the Americans or the Japanese, they [the computers] may not be here tomorrow."[85] In stark contrast to its vehement attack on American efforts to control the activities of British firms involved in the trans-Siberian pipeline affair, the British government failed repeatedly to take action against the United States government or its firm.

In this case, both ICL STC and the British government were dependent on access to American products, and neither was dependent on access to the American market. ICL's willingness to fulfill its original contracts despite U.S. restrictions, and the British governments reluctance to challenge the United States on its behalf, support the hypothesis that firms are more likely to be swayed by dependence on market access than dependence on foreign suppliers, whereas national governments are more concerned about access to guaranteed sources of supply than markets.

VI. The Costs of Using Economic Sanctions

Restricting access to domestic suppliers or markets may, however, have political and economic costs. These costs must be balanced against the benefits derived to decide when to use dependence as a source of political influence.

This section highlights several limitations associated with this usage. They

include the reciprocal nature of dependence, the effect of such a policy on the reliability of American firms, and the problem of the indigenous development of restricted resources. The problems inherent in attempting to influence firms operating abroad are reflected in the fact that in several recent embargoes, including those relating to the Moscow Olympics, Afghanistan, and Uganda, the US has refrained from seeking to control actions of foreign subsidiaries of American firms.[86]

A. Reciprocal Nature of Dependence

Hypotheses of U.S. influence based on firm and state dependence provide accurate predictions of success in the majority of cases analyzed above. One notable exception, however, is the case involving the Toshiba corporation. Despite the fact that Toshiba was highly dependent on access to both the American market and the supply of information and technology from American producers, the United States was not able to deter Toshiba from violating its export embargo, nor was it able to inflict a substantial penalty on Toshiba for the violation. A brief review of the Toshiba case demonstrates some of the limitations of U.S. influence in the Western alliance.

In 1987, Toshiba Machine Company, a subsidiary of Toshiba Corporation of Japan and Kongsberg-Vapanfabrik of Norway, sold computerized milling equipment to the Soviet Union that was capable of producing highly sophisticated propellers for Soviet submarines. The military security implications of their actions were a matter of dispute, but the sale was in direct violation of multilateral agreements restricting the sale of sensitive technologies to the Soviet Union. In response to this breach of security, the U.S. Congress sought to penalize Toshiba by banning all U.S. government purchases from Toshiba and all American imports from Toshiba Machine Company for three years. The Administration sought to use the same sanctions to convince the Japanese government to strengthen its export control system. Given the dependence of Toshiba on the American consumer market (losses of over $100 million in sales for Toshiba were projected over the three year embargo),[87] the hypotheses would predict that the United States should have been able to influence corporate policy, and, failing to do so, should have been able to penalize Toshiba in order to deter future transgressions. The Administration did succeed in gaining a guarantee from the Japanese government to double the size of its export control staff and to increase penalties for violators, but the vast majority of penalties against Toshiba were dropped. Instead of cutting off access to lucrative U.S. government and consumer markets for all Toshiba products, the final version of the sanctions embargoed only Toshiba toasters, microwave ovens, and other "low-level" goods.[88]

The primary reason that the United States government had to back away from its original penalties was American dependence on the supply of computer chips from Toshiba.[89] The United States military has long pursued a policy of relying primarily on U.S. sources of supply. Following this philosophy, the U.S. military relies heavily on Texas Instruments for its semiconductor and computer needs. Texas Instruments, however, has moved the majority of its production facilities overseas -- notably to

Japan where it runs a production plant with a subsidiary of Toshiba. As a result, cutting off all government contracts with Toshiba would result in cutting off the U.S. military's access to its major supplier of semiconductor and computer chips.[90]

The Toshiba case is important because it demonstrates that dependence can be reciprocal. Firm and state dependence on access to foreign markets and suppliers can be used by all states as a source of political influence.[91] Consequently, despite possession of a preponderant amount of economic and military resources, the United States may not always be able to implement its policies unilaterally at home or abroad.

B. Reliability of American Firms

Threatening to cut off foreign access to American suppliers has given the United States a source of political leverage. However, use of that leverage can be costly to the American companies whose trade is terminated.

When American suppliers are restricted, firms that were dependent on them will search for alternate sources of supply. The initial consequence for American suppliers is the cost of losing a contract. Long term costs may, however, be much greater. The American companies risk losing future business by losing their reputation as reliable sources of supply. If these companies cannot guarantee that the government will not, at some point, intervene and stop a sale, then they cannot guarantee fulfillment of their contracts.

During the Pipeline crisis, for example, when Caterpillar Tractor Company's exports of pipe-laying equipment were terminated, a spokesperson for the company complained that, "there is no doubt that during the restrictions the Soviets came to regard us as an unreliable supplier."[92] As a result, once the embargo was lifted Caterpillar lost its contracts to a Japanese rival, Komatsu, whose main selling point was its guarantee to fulfill contract obligations without the fear that the Japanese government would intervene and terminate them at some point in the future.

C. Indigenous Development of Restricted Resources

The statistical analysis demonstrated a tendency for firms to respond more readily to threats to terminate their access to the American consumer market than threats to cut off access to the supply of certain goods. When the supply of a particular good is cut off, firms seek out alternate suppliers. When alternate suppliers are not available, firms are often willing, when technically feasible, to develop the restricted goods internally. Internal research and development can be an extremely costly investment. Once foreign firms have made the investment and have borne the sunk costs of research, development, and production of a new product, they are not likely to return to their former sources, should that supply become available again.

In addition to a loss of business, restricting the supply of certain goods from American sources provides foreign competitors with a motivation to pursue research and development in areas that would not have been pursued had the products been available. Therefore, in the long run, the technological lead of the United States will be undermined if access to sophisticated products it now produces is restricted. One of the best incentives for foreign firms to invest in research and development is the possession of an existing model of the final product.

Finally, traditional arguments against protectionist practices emphasize that they sacrifice the broader gains from liberalization and may provoke an international trade war. The gains from liberalization are traditionally considered in terms of consumer welfare and overall efficiency of American production. The gains from liberalization are particularly pronounced in high technology industries, and the negative effects of protectionist policies are particularly severe. To a large degree, trade in these industries involves the exchange of components rather than final products. Access to foreign suppliers of these components increases the speed and efficiency of innovation and competition in these industries. Long term competitiveness of the American industries may be weakened without the challenge of foreign competitors or access to international joint ventures.

VII. Conclusion

The study analyzed allied corporate and national reactions to United States' export control policy in order to determine those conditions under economic sanctions can be used to enforce national policies abroad. It demonstrated that dependence among states and firms is a potent source of political power. Dependence on American suppliers and access to the American consumer markets in certain industries has enabled the United States to implement its export control policy abroad since 1949, and can be used by all states as a source of political power.

Using dependence, rather than hegemony or the distribution of resources with an alliance, to explain alliance behavior focuses the researches attention on the presence of multiple links between states in international politics. These links and the number of alternatives available to an actor are as important a source of political power as the physical resources it possesses. Furthermore, these links may include the control of transnational resources and the possibility that several states may exert control over them. Traditional conceptions of the territorial state and state power overlook these connections and their use as a source of political power.

Secondly, interdependence underscores the fact that the political resources resulting from a dependent relationship may be reciprocal. The dependence of firms and states on others may be used by all states as a source of political influence.

A primary implication of the argument is that despite continued American dominance in both the world economy and world politics, growth of alternate markets

and supplier in other countries, such as Germany or Japan, will limit U.S. influence and may result in increased American dependence on foreign markets and suppliers. Consequently, despite possession of a preponderant amount of economic and military resources, the United States may not always be able to implement its policies unilaterally at home or abroad. Attempts by the Bush administration to strengthen allied compliance with the U.S. embargo against Cuba in the fall of 1992 are likely to demonstrate this fact.[93] The threat of sanctions against foreign ships docking in Cuba is not likely to be effective, since the firms and industries involved are neither dependent on access to American suppliers or the American consumer market. The condemnation of the Cuban Democracy Act by American allies in the United Nations in November of 1992 and the willingness of non-U.S. firms to continue their shipments to Cuba are early indications that the policy will indeed fail.

Finally, this project highlighted political resources that result from dependence between states and firms that may be used for or against each member of the alliance. The ability to use these resources has a direct and increasingly significant impact on national economic and military security, technology transfer, industrial innovation and competitiveness at home and abroad. At the same time, exploitation of dependence for political purposes may have political and economic costs, and these costs must be weighed against the benefits gained from using this source of political power. Understanding the effects of economic dependence on political power and alliance dynamics is crucial to resolution of conflicts resulting from competing national desires to control transnational activities. The continuing economic vitality of Japan and South East Asia and the economic integration of Western Europe, combined with the revitalization of Eastern Europe and the economic crisis in the former Soviet Union, and the potential for arms proliferation of both conventional and strategic weapons, will intensify these disputes, making solutions to questions of sanctions and sovereignty crucial.

Appendix

Table 7: Variable Definitions

Success:

Successful implementation of U.S. export control policy abroad. Success is coded dichotomously as Yes or No.

U.S. Military Hegemony:

The proportion of U.S. military expenditure in the Western alliance. This is very highly correlated with the relative size of U.S. armed forces and is an indicator of the military component of U.S. hegemony in the alliance. Relative military expenditure varies between .62 and .74.

U.S. Economic Hegemony:

Combination of U.S. exports and imports as a proportion of total OECD exports and imports. This is an indicator of one part of the economic component of U.S. hegemony. Size varies between .18 and .24.

Government Intervention:

Intervention by the host government which challenges U.S. policy initiatives. GovInt is coded dichotomously as Yes or No.

ConM:

Concentration of world imports in a particular sector. The availability of alternate markets is calculated using the Hirschman-Herfindahl index of concentration of world imports in a particular industrial sector. ConM is a continuous measure from 0, indicating that imports are equally distributed among all actors and alternate markets are plentiful, to 100 indicated that products in that sector are being imported by one state and no alternate markets are available.

ConX:

Concentration of world exports in a particular sector. The availability of alternate suppliers is estimated using the HH index of concentration of world exports in a particular industrial sector. ConX is a continuous measure from 0, indicating that exports are equally distributed and alternate suppliers are readily available, to 100 indicated that all products in that sector are being produced in one state.

P_x and P_m:

Percentage of the target country's exports or imports accounted for by trade with the United States for a particular industrial sector. P_x and P_m range from 0 to 1.

Table 8: Successful Implementation of U.S. Export Controls, 1951-1988

2. Gary Hufbauer and Jeffrey Schott find that sanctions were successful in only 5 of 27 cases involving "high politics." Cases involving export control policy will be considered "high politics" because this policy has a direct impact of national economic and military security of the states involved. Furthermore, the enforcement of one state's export control policy abroad, against the interests of the countries involved, undermines their sovereign authority over actors within in their territory. Hufbauer and Schott, *Economic Sanctions Reconsidered*, pp. 81-82.

3. Albert Hirschman, *National Power and the Structure of Foreign Trade* (Berkeley: University of California Press, 1980); others include Klaus Knorr and Frank Trager, eds. *Economic Issues and National Security* (Lawrence, Kansas: Allen Press, Inc., 1977), and Klaus Knorr, *The Power of Nations* (New York: Basic Books, 1975).

4. Dependence and interdependence have been defined in a variety of ways in political science, for a discussion of the concept of dependence and an example of several different interpretations, see: David Baldwin, "Interdependence and Power: A Conceptual Analysis," *International Organizations* (Autumn 1980) 34, pp. 471-506.

5. See Albert Hirschman, *National Power and the Structure of Foreign Trade*; A. Rapoport, T. P. Hopmann, Nash, Walton and McKersie have all applied similar reasoning to the game theoretic analysis of asymmetrical preferences or information. See for example: A. Rapoport, *Two Person Game Theory* (Ann Arbor: University of Michigan Press, 1969), and T. P. Hopmann, "Asymmetrical Bargaining in the Conference on Security and Cooperation in Europe," *International Organization* 32 (Winter 1978).

6. Hufbauer and Schott find that the proportion of trade between the actors involved has a positive effect on the likelihood that the sanctions will be successful. See Hufbauer and Schott, *Economic Sanctions Reconsidered*, pp. 85-86.

11. Political scientists have debated the importance of defining power in terms of a causal relationship rather than defining it in terms of the possession of a set of resources or capabilities at length. See: David Baldwin, "Power Analysis and World Politics: New Trends versus Old Tendencies," *World Politics* 31 (1979); Klaus Knorr, *The Power of Nations*; and Robert Dahl, "Power," *International Encyclopedia of the Social Science* (New York: Macmillan Press, 1968), "The Concept of Power," *Behavioral Science* 52 (1958), and *Who Governs? Democracy and Power in an American City* (New Haven: Yale University Press, 1961); and Steven Lukes, *Power: A Radical View* (New York: Macmillan Press, 1974).

12. Donald Losman provides an interesting analysis of Israeli, Cuban and Rhodesian success in compensating for economic sanctions by developing alternate markets and sources of supply at home and abroad. Donald Losman, *International Economic sanctions: The Cases of Cuba, Israel, and Rhodesia* (Albuquerque: University of New Mexico Press, 1979).

13. Robert Keohane and Joseph Nye, *Power and Interdependence: World Politics in Transition* (Boston: Little Brown, 1977). The immediate loss from the termination of trade is much greater than the ultimate loss after resources have been reallocated. While modern trade theory insists that this is not necessarily true, Keohane and Nye's analysis must take into account given the fact that harassed decision makers generally have short-run views and interests. Given a certain ultimate loss, the influence which one country exercises upon another through foreign trade is therefore likely to be larger the greater the immediate loss which it can inflict by the stoppage of trade.

14. Edward Mansfield makes a similar point, see: Edward Mansfield, "The Concentration of Capabilities and International Trade," Forthcoming.

15. For a further discussion on this point and an in depth critique of Hirschman's analysis, see Wagner, "Economic Interdependence, Bargaining, Power and Political Influence," *International Organization* (1988).

There is also a voluminous literature among power theorists concerning debates over the fungibility of power. For an example of this debate, see: David Baldwin, "Power Analysis and World Politics; and Klaus Knorr, *The Power of Nations*; and Ray, "Power Disparities and Paradoxical Outcomes," *Journal of Conflict Resolution* 12 (1986).

Lowenfeld, *International Economic Law: Trade Controls for Political Ends*; and Lowe, "Public International Law and the Conflict of Laws," *International and Comparative Law Quarterly* 33, 515 (1984).

20. In response to the Arab boycott of Israel and the seizure of hostages in Iran, the United States justified the extraterritorial extension of its regulations on the basis of firm association with American individuals or American corporations; while its actions against Libya were applied against all firms trading in United States origin goods and technology regardless of their affiliation with American firms.

21. The purpose of the act is to secure the supply of resources at home and abroad that could affect the welfare and foreign policy of the United States. See: Jack N. Behrman, *National Interests and Multinational Enterprises* (Englewood Cliffs: Prentice Hall, Inc., 1970), p. 103.

22. See for example: Philip Hanson, *Trade and Technology in Soviet-Western Relations* (New York: Columbia University Press, 1981), and *RIIA Discussion Papers 1, Soviet Industrial Espionage: Some New Information*, (London: The Royal Institute of International Affairs, 1987); Robyn S. Metcalfe, *The New Wizard War: How the Soviets Steel U.S. High Technology -- And How We give it Away*. (Redmond, Washington: Tempus Books, 1988); and Antony Sutton, *Western Technology and Soviet Economic Development, vols. 1-3* (Stanford: Hoover Institution, 1968-73).

23. CoCom includes all NATO countries, except Iceland, plus Japan. For a discussion of the Coordinating Committee on East-West Trade, see: Gunnar Adler-Karlsson, *Western Economic Warfare, 1947-1967* (Stockholm: Almquist and Wiksell, 1968); Gary Bertsch, *East-West*

Strategic Trade, CoCom and the Atlantic Alliance (Paris: Atlantic Institute, 1983); Michael Mastanduno, "Strategies of Economic Containment: United States Trade Relations with the Soviet Union," *World Politics* 37 (July 1985); and National Academy of Sciences, Panel on the Future Design and Implementation of U.S. National Security Export Controls, Committee on Science, Engineering and Public Policy, *Finding Common Ground: U.S. Export Controls in a Changed Global Environment* (Washington, D.C.: National Academy Press, 1991).

24. The primary U.S. objective in the cases discussed below is assumed to be the implementation of its own embargo policies, rather than the ultimate effect their implementation will have on the targeted state. Signaling discontent is not sufficient to achieve this objective. When a state is unable to entice or coerce others to participate with a particular policy, it may attempt to pursue its policy without their support. Rather than merely signaling its discontent when allied cooperation is not forthcoming to the extent it desires, the United States has often attempted to implement its policies unilaterally. The eventual outcome or effect the strategic embargo and export controls have on the targeted state(s) is not of immediate concern; rather, the focus of this project is on power relationships within the Western alliance as reflected in the successful implementation of U.S. regulations abroad despite a lack of allied support.

25. This is not intended to minimize the importance of symbolic action. As David Baldwin argues in *Economic Statecraft*, "When a state -- especially a powerful state -- goes out of its way to clarify its values and intentions for others, such actions are neither frivolous nor pointless." Symbolic action in the form of diplomatic protest, bilateral and multilateral negotiation, legal action or the imposition of blocking legislation will be interpreted as an indicator of state preferences and diplomatic positions. Focusing on an instrumental definition of success and failure does not neglect the role of symbolic actions; rather, it enables the analysis of specific influence attempts in terms of the conflict of interests the symbolic actions represent. David Baldwin, *Economic Statecraft* (Princeton: Princeton University Press, 1985), pp. 96-101. See also: Stephen Kobrin, "Enforcing Export Embargoes Through Multinational Corporations," pp. 33-34.

26. Michael Mastanduno, *Economic Containment*, pp. 82-96, 114-115.

27. See: Douglas Rosenthal, William Knighton, *Chatham House Papers #17: National Laws and International Commerce: The Problem of Extraterritoriality* (London: Routledge & Kegan Paul, 1982); Kenneth, Abbott, "Collective Goods, Mobile Resources, and Extraterritorial Trade Controls;" A. Lowenfeld, *International Economic Law: Trade Controls for Political Ends*; and Lowe, "Public International Law and the Conflict of Laws," *International and Comparative Law Quarterly* 33, 515 (1984).

28. For example, in March of 1986 the United States and Germany signed an agreement for German participation in the American Strategic Defense Initiative (SDI) projects. The agreement specifically linked German participation in high-technology military research projects with an agreement from the German government to tighten its export control procedures and to give the West German Ministry of Defense a larger role in implementing and enforcing the controls. *Le Figaro*, 21 April 1986; *Financial Times*, 21 April 21, 1986.

29. See for example: Douglas Rosenthal, William Knighton, *Chatham House Papers #17: National Laws and International Commerce: The Problem of Extraterritoriality* (London: Routledge & Kegan Paul, 1982), pp 58-59.

31. This study would be strengthened if export and import data as a percentage of domestic consumption and production figures were used. This is a promising area for future research. An earlier, more detailed study of these cases confirms that the assumption is valid and that aggregated indicators of dependence provide a good approximation of decision makers perceptions of their dependence on external suppliers and markets. See: George Shambaugh, *Sanctions and Sovereignty: the Political Economy of International Trade*, Forthcoming 1993.

32. Albert Hirschman, *National Power*, pp. xviii-xix, 87-97, 157-162; Edward Mansfield, "The Concentration of Capabilities of International Trade," Forthcoming.

33. The standardized Hirschman-Herfindahl index is equivalent to a general concentration index used widely in strategic studies. See: James Lee Ray and J. David Singer, "Measuring the Concentration of Power in the International System," *Sociological Methods and Research* 1 (May 1973), pp. 403-437; and R. Taagepera and James Lee Ray, "A Generalizable Index of Concentration," *Sociological Methods and Research* 5 (1977), pp. 367-384.

36. Ibid.

37. GDP per capita may be used in place of GNP per capita. GNP per capita was chosen because it includes earnings from U.S. multinational firms which are the primary focus of this project.

38. See: Robert Gilpin, *War and Change in World Politics*, and *The Political Economy of International Relations*; George Modelski and William Thompson, *Sea Power and Global Politics, 1494-1983* (Seattle: University of Washington Press, 1987); Charles Doran and Wes Parsons, "War and the Cycle of Relative Power," *American Political Science Review* 74 (December 1980), pp. 946-965; Alan Ned Sabrosky, ed. *Polarity and War* (Boulder: Westview, 1985); A.F.K. Organski and Jack Kugler, *The War Ledger* (Chicago: University of Chicago Press, 1980).

39. In the Western alliance, relative military expenditure of each state is very highly correlated with the proportional number of armed forces in each state relative to the total number of armed forces in the Western alliance. Using relative number of armed forces as an indicator of the military component of hegemony provides comparable results to analyses which use relative military expenditure.

40. Despite inter-departmental rivalry, the Executive branch can manipulate its export control policy largely without interference from Congress or the electorate. see: Micahel Mastanduno, *Economic Containment*.

41. This caveat has been noted by several scholars researching similar issues, see: Stephen J. Kobrin, "Enforcing Export Embargoes Through Multinational Corporations," p. 34.

42. Auxiliary regression analyses may be performed to confirm that multicollinearity among the independent variables is not a problem in this analysis.

43. While Logit curves are not designed to maximize the "goodness of fit," they provide reliable coefficients and tend to have a higher explanatory and predictive power than OLS models when being applied to dichotomous dependent variables. Least Squares Estimations, like OLS, assume a linear relationship between the independent and dependent variables. Under this assumption, parameters for the equation are estimated so that the squared sum of the errors between the predictions made by the model and the data are minimized. Maximum likelihood estimations, like Logit, on the other hand, assume a non-linear relationship among the variables. They estimate parameters that imply the highest likelihood or probability of achieving the pattern found in the data.

For a discussion of Logit and Probit models, see: John H. Aldrich and Forest D. Nelson, *Linear Probability, Logit and Probit Models* (Beverly Hills: Sage Publications, 1984).

44. It is possible that Success at time t-1 could effect the likelihood of Success at time t. However, the time between cases varies substantially and many of the cases in the analysis take place simultaneously. As a result, incorporating a lagged dependent variable into the equation would not provide a reliable indicator of the effect of success in one case on the outcome of the next. Furthermore, the influence attempts involve actions taken in different industrial sectors. It assumed to be unlikely that decision makers operating in one industry would necessarily be aware of, or alter there behavior as a result of, actions taken in an unrelated industry at an unspecified time in the past. For example, it is unlikely that U.S. enforcement efforts in the automobile industry in the case of Ford Motor Company of Canada in 1959 affected the decisions of IBM subsidiaries and the French Government in 1962.

45. Gunnar Adler-Karlsson, *Western Economic Warfare, 1947-1967*; Gary Bertsch, *East-West Strategic Trade, CoCom and the Atlantic Alliance* (Paris: Atlantic Institute, 1983); Bruce Jentleson, *Pipeline Politics* (Ithaca: Cornell University Press, 1986); Klaus Knorr, *The Power of Nations*; Stephen Kobrin, "Enforcing Export Embargoes Through Multinational Corporations: Why Doesn't It Work Anymore?;" Michael Mastanduno, *Economic Containment*, and "Strategies of Economic Containment," *World Politics* 37 (July 1985); and Stephen Woolcock, *Western Policies on East-West Trade*, Chatham House Papers, #15, (London: Royal Institute of International Affairs, 1982).

46. Adler-Karlsson, *Western Economic Warfare, 1947-1967*, p. 27. By the time this act was implemented the majority of its requirements had already been fulfilled. It served primarily to maintain rather than elicit allied cooperation.

47. Gunnar Adler-Karlsson, *Western Economic Warfare, 1947-1967*, p. 45. Michael Mastanduno offers a different perspective, arguing that the Battle Act and aid denial may not have constituted a valid threat and hence may not be the primary reason behind Western European cooperation. Mastanduno persuasively asserts that the given the executive's continual failure to use negative sanctions despite repeated violations, the threat of removal of aid was not a credible one and therefore cooperation did not continue. See: Michael Mastanduno, "Strategies of Economic Containment."

48. Gunnar Adler-Karlsson, *Western Economic Warfare, 1947-1967*, p. 40.

Fathers' Rights, Mothers' Wrongs?:

Reflections on Unwed Fathers' Rights and Sex Equality

by Mary L. Shanley

The case of Baby Girl Clausen, involving a custody dispute between the natural parents, Cara Clausen and Daniel Schmidt, and the adoptive parents, Roberta and Jan DeBoers, over who should have custody of the baby surrendered for adoption, focused national attention on the issue of the rights of unwed fathers to custody of their infant children. Cara Clausen irrevocably surrendered her baby for adoption two days after its birth, as did the man named as the child's father on the birth certificate. Within weeks, however, Clausen regretted her decision and informed Daniel Schmidt that he was the baby's father. Schmidt responded by filing a petition to establish paternity, and initiating legal action to block the adoption. Schmidt contended that as a natural parent he has a right to custody of his child unless it is shown that he is "unfit" to be a parent. The Iowa Supreme Court agreed, affirming an opinion of the District Court that Daniel Schmidt's parental rights had not been properly terminated, and that no order of adoption giving the DeBoers custody of Baby Girl Clausen could be finalized.

While the majority of unwed fathers never seek custody of their children, Daniel Schmidt was not the first, and will certainly not be the last, to claim a right to custody of his child after the mother has initiated action to place the child for adoption. Indeed, several recent cases in various states have argued that natural fathers have a constitutionally-protected right to custody unless shown to be "unfit." The Supreme Court has so far refused to hear any of these cases, but the claim is well worth considering. Unwed fathers who seek to block a mother's decision to place an infant for adoption do so for a variety of reasons. Sometimes, like Daniel Schmidt, they act when the natural mother has changed

her mind and seeks to reverse her decision. In other instances a man seems to hope that if he prevents the adoption the mother will decide to raise the child herself and keep in contact with the father; preventing the adoption is a way of retaining a relationship with the mother. In yet other cases the man acts because his parents wish to raise their biological grandchild. In yet others, the man wishes to assume full custody and raise the child himself. Yet all these different cases raise questions about whether a biological father has--or should have--a right to a parental relationship with his child.

I wish to look at some of the issues raised by an unwed fathers' claim to block the adoption of his newborn child in the light of their implications for achieving greater equality between women and men, mothers and fathers.

Such an examination involves at least two distinct but related issues. First, there must be some understanding of the basis of custodial claims of biological parents in general. Second, there must be some judgment about whether the claims of fathers and mothers are identical at the birth of their child, or are sufficiently different that the law should give greater weight to the wishes of one parent than those of the other, or use some quite different criterion--like the "best interest" of the child--when they disagree.

I argue here that arguments for fathers' rights to custody of children that rest upon genetic rather than social or nurturant ties suggest that because a father "owns" his genetic material, he has "rights" in his offspring. I claim that such arguments are misguided. Parental rights for both mother and father properly stem from nurturance and actual care, rather than genetic ties, and should draw upon images and language that suggest stewardship rather than a proprietary notion based on genetic relationship. I also believe that gender-neutral arguments that suggest that because father and mother have a symmetrical genetic relationship to the child they have symmetrical parental rights at birth are false; such arguments run the risk of reinstating patriarchal relations under the guise of sexual equality.

A liberal polity interested in protecting people's rights to intimate association and family life should recognize an unwed father's claim to custody of his child, but only when he has concretely demonstrated his intent to assume parental responsibilities prior to the mother's decision to relinquish the child for adoption. This argument is likely to displease some advocates of both fathers' and mothers' rights. By recognizing some paternal claims it will not satisfy advocates of women's complete autonomy in decision-making. By grounding the father's claim in behavior that in many cases must be undertaken prior to the child's birth, it will appear too stringent to many fathers' rights advocates. Yet only some such rule, I believe, captures the fact that parental rights derive from a mixture of biological relationship, assumption of responsibility, and provision of care. Parenting involves being in a relationship with a dependent being, and a parental "right" cannot properly be conceived of as something independent of the relationship.

It is worth noting that these principles alone would not resolve the case of Baby Girl Clausen. They suggest that in most cases an unwed father needs to act prior to the child's birth in order to block the adoption of a newborn infant, yet Cara Clausen's misrepresentation about who the father was may have deterred Daniel Schmidt from taking action to demonstrate his intention to nurture and raise his offspring. Perhaps exceptions need to be made in such cases, although I am inclined to think it would be more profitable to think about--and try to change--the clearly inadequate counseling Clausen received prior to relinquishing her parental rights, and the kinds of advice given to the DeBoers. Beyond that, we need to try to understand the circumstances that might lead an unwed mother to lie about or conceal the paternity of her child. While determining the proper bases of parental rights is clearly an important task, justice in family relationships depends not only upon determining proper legal principles, but also upon achieving the social and economic conditions that allow family relationships to thrive.

I. Unwed Parents' Custody Rights in Common Law and Constitutional Law

A. The Patriarchal Construction of the Common Law Regarding Custody

Unwed fathers' assertions of parental rights need to be seen against the background of traditional legal rules governing custody. Under English common law, a man had complete custodial authority over any children of his marriage. This rule derived from the common law doctrine of coverture, by which a woman's legal personality was subsumed in that of her husband during marriage. A wife could not enter into contracts, sue or be sued, or engage in other legal transactions without being joined by her husband. He owned outright her moveable property, and had control of (although he could not alienate) her real estate. Torts she committed in his presence were chargeable to him, not to her. A married woman also had no right to refuse her husband sexual access--marital rape was not recognized as an offense. So complete was the husband's custodial authority that during his lifetime he had the power to convey his parental rights to a third person without the mother's consent, and could name someone other than the mother to be the child's guardian after his death.[1]

If a woman who was not a wife became a mother, however, the child was "fillius nulli," the child of no one. But women usually raised their children born out-of-wedlock, and judicial practice from about the beginning of the nineteenth century, recognized the mother as the custodian of a nonmarital child.[2]

Thus under the common law a man's legal relationship to his offspring was governed by his relationship to their mother. If the woman was his wife, the children were "his," so much so that he exercised exclusive custodial authority. If their mother was not his wife, however, a man was a "stranger" to his children and she was the child's legal parent. The marital child took the father's surname, the nonmarital child did not. The marital child had a right to financial support from the father, the nonmarital child did not. The marital child had the right to inherit from a father who died without a will, the nonmarital child did not.[3] Some authors assume that "Custody was vested in the mother

because the law presumed that she was better suited to raise children,"[4] but this is mistaken--custodial regulations stemmed from the deeply patriarchal character of family law. The common law affected both lineage and property; it allowed a man to lay claim to legitimate heirs (for without marriage, who would know for certain who the father of a child might be?) and to avoid squandering his estate supporting other children. At the same time the common law placed both social stigma and economic burdens on unmarried mothers; woman's sole responsibility for her nonmarital children punished her for sex outside of marriage, and increased women's incentives to give themselves to a man through marriage.

It is no wonder that women's rights advocates from the mid-nineteenth century on protested against the patriarchal assumptions and the sexual double-standard implicit in this configuration of rules governing marital and non-marital parenthood. During the nineteenth century, in part due to women's rights advocacy, legislatures began to replace common law rules with statutes that granted wives equal custodial rights as their husbands. Judges began to prefer mothers as custodians of marital children of "tender years" (usually under seven or ten years of age).[5] Eventually the standard of the "best interest of the child"--which did not automatically prefer either parent and which purported to recognize the needs of the child as paramount--replaced any presumption explicitly favoring the custodial claim of either married parent when they divorced.

Historically, the law governing custody of nonmarital children incorporated a strict sex-based distinction--mothers, not fathers, had custody of these children. One author observed that "Until a few years ago, unwed fathers were ignored or received virtually no protection from either the United States Constitution or the statutes of most states. Indeed, courts and legislatures traditionally have been openly hostile to the recognition of parental rights of unwed fathers."[6] The notion that laws placing the custody of nonmarital children in their mothers' hands reflected hostility to fathers displays an appalling ignorance of the patriarchal roots of family law. Far from favoring mothers or harming fathers, laws

declaring a nonmarital child to be *fillius nulli* shielded fathers from financial responsibility for these children, while unmarried women who bore children outside of marriage were "ruined;" their desperate attempts at suicide and infanticide dot the pages of social histories and nineteenth-century novels. The grain of truth in the assertion that the law "ignored" unwed fathers is that unwed fathers and mothers had very different rights and responsibilities with respect to their children. If one is committed to equal rights for men and women, such different treatment calls out for the most scrupulous examination leading either to rejection of the distinction as contrary to the principle of equality, or demonstration of why and how neutrality in principle would lead in fact to unequal treatment.

B. The Emergence of Unwed Fathers' Constitutional Rights

The first such initiatives to revise the laws governing custody of nonmarital children came not from feminists but from men who had sired children out of wedlock. Over the past twenty years, five decisions of the Supreme Court--Stanley v. Illinois, Quilloin v. Wolcott, Caban v. Mohammed, Lehr v. Robertson, and Michael H. v. Gerald D.--laid down some guidelines for thinking about unwed fathers' rights. Although the Supreme Court decisions by no means resolve all the dilemmas surrounding the custody of infants born to unmarried parents, they provide a useful starting point for thinking about those issues.

The United States Supreme Court first considered the custodial rights of unmarried fathers in 1972 in Stanley v. Illinois [405 U.S. 645 (1972)]. Mr. Stanley had lived with his three children and their mother intermittently for eighteen years. When the mother died, the state of Illinois declared the children wards of the state and placed them with court appointed guardians. This was done without a hearing as to Stanley's fitness as a parent. Stanley protested, arguing that Illinois law denied him equal protection of the laws since neither unwed mothers, nor married fathers or mothers, could be deprived of custody of their children unless they were shown to be unfit. The Supreme Court agreed, and stated

that "[t]he private interest here, that of a man in the children he has sired and raised, undeniably warrants deference and, absent a powerful countervailing interest, protection."[7] The state could not remove children from Stanley's custody without a hearing.

In cases after Stanley the Court drew distinctions between fathers who, like Stanley, had been involved in raising their children, and those who had not assumed day-to-day practical responsibility for them. In Quilloin v. Walcott [434 U.S. 246 (1978)], the Supreme Court said that a Georgia statute that stipulated that an unwed father could veto the adoption of his child by the child's stepfather only if the natural father had legitimated the child was constitutional. The law did not abridge any constitutionally protected right when contact between the father and child had been only sporadic. The next year, hearkening back to Stanley, the Court held in Caban v. Mohammed [441 U.S. 380 (1979)] that a New York statute that required mothers, but not fathers, to consent to the adoption of their children was unconstitutional when a unwed father's relationship to his child was "fully comparable" to that of the mother. Mr. Caban who had lived with his children and their mother for several years, argued that the law allowing the mother's new husband to adopt the children without Caban's consent violated the equal protection clause, because Caban's new wife could not adopt the children without the natural mother's consent. Caban also claimed that natural fathers had a due process right or liberty interest "to maintain a parental relationship with their children absent a finding they are unfit as parents." [441 U.S. at 385] The Supreme Court agreed with Caban, but explicitly reserved any opinion about whether such a distinction would be valid with regard to newborn adoptions.

Lehr v. Robertson [463 U.S. 248 (1983)] also concerned a natural father's effort to block the adoption of his child by her stepfather, but unlike Mr. Stanley and Mr. Caban, and like Mr. Quilloin, Jonathan Lehr had had almost no contact with his daughter, Jessica. The case was complicated by the fact that the majority and minority disagreed over whether he had ignored the child until recently, or, as he claimed, had repeatedly attempted to establish contact with his daughter but was thwarted by the mother. The majority held that

Lehr had not made sufficient contact to establish a parental right, declaring that a father's constitutional rights are a function of the tangible and affirmative responsibilities he accepts towards his children, and that if he does not "grasp[] the opportunity and accept[] some measure of responsibility for the child's future, the Federal Constitution will not automatically compel a state to listen to his opinion of where the child's best interests lie." In a dissent, Justice White disagreed not only about the factual question of whether Lehr had attempted to contact his daughter, but also with the framework used by the majority to determine the existence of the unwed father's liberty interest. White asserted that the biological relationship was in-and-of itself a constitutionally protected interest. In White's view, the standard adopted by the majority in Lehr is "more demanding" than the Constitution requires, since "a biological father has a constitutionally cognizable interest in an opportunity to establish paternity." [462 U.S. at 2??]

The most recent Supreme Court case dealing with an unwed father's rights, Michael H. v. Gerald D., carved out an exception to the rule of thumb that the Court seemed to be developing in these cases, i.e. that an unwed father who had established a substantial relationship with his child had a constitutionally protected interest in maintaining that relationship. In Michael H. the Court found that a California statute that created an irrebuttable presumption that a woman's husband was the father of a child she bore was constitutional. A biological father, Michael H., who had lived with and provided care to his daughter and her mother even though the mother was married to and intermittently lived with her husband as well, argued that he had a right to a hearing to establish his paternity when the husband and wife sought to cut off his contact with the child.

The case produced no fewer than five opinions from a deeply fractured Court. The plurality decision, written by Justice Scalia and joined only by Chief Justice Rehnquist, rejected Michael's claim. Scalia contended both that the state had an interest in preserving the "unitary family," and that neither Michael nor his daughter had a constitutionally-protected interest in maintaining their relationship.[8] Justices O'Connor and Kennedy

agreed with Scalia's conclusion but not his reasoning, as did Justice Stevens in a separate concurring opinion. Two dissenting opinions supported Michael's right to a hearing, but used quite different grounds to do so. Justice White, joined by Justice Brennan, reiterated the view he expressed in Lehr that biology itself creates a presumptive parental right. Justice Brennan, joined by Justices Marshall and Blackmun, argued that the combination of biology and nurture establishes parental rights.[9]

Since none of these Supreme Court cases dealt with newborns, it is not clear whether under the Constitution an unwed father has a right to an opportunity to establish the kind of relationship and provide the kind of care that the Court has declared protects parental rights. Furthermore, it is not clear what the Court thinks the extent of an unwed father's custodial rights at the time of birth are: does he have only a right to be heard concerning the child's best interest, or to veto an adoption and assume custody himself? These are the questions I examine in the next section.

II. Rethinking the Bases of Parental Rights

Advocates of biological fathers' rights to assume custody of their nonmarital children criticize the traditional law for setting forth different rights and responsibilities for unwed mothers and fathers and for looking at the "best interest" of the child rather than a "fitness" of the father in deciding whether or not to award custody to unwed fathers. In making their case, they take a page from women's rights campaigns of the past century and assert that the law must be neutral with respect to men and women, and that stereotypes that relegate responsibility for the care of children exclusively to women must be replaced by images of paternal as well as maternal care. By the logic of gender neutrality, just as a biological mother has a right to custody of her newborn child unless she is shown to be "unfit" to be a parent, so the biological father should have a right to exercise custody unless shown to be unfit, particularly if the mother has relinquished her parental rights. Although firmly committed to equal rights and skeptical about the appropriateness of the best interest

standard to decide custody of newborns, I argue here that many of the proposals for equalizing the parental claims of unwed mothers and fathers rest on an inappropriate model of individual rights that fails to take account of the profoundly relational aspects of being a parent or claiming a parental right.

Yet having critiqued the equality-through-neutrality model, I find myself confronted by the task of finding another model to resolve these custodial disputes. One would be to let a mother's wishes determine the placement of nonmarital children, what Mary Becker has in her discussion of custody after divorce called a "maternal deference" standard. But I worry that in the very different treatment it affords to women and men, such a standard will do nothing to encourage the disruption and displacement of traditional sex roles. What is needed to help us move towards a society that promotes both equality and parental responsibility is a criterion that takes seriously a biological father's responsibility to assume parental obligations both prior to and after his child's birth; only the assumption of such responsibility would enable him to oppose the mother's decision to surrender the child for adoption. This means that a court hearing a biological father's petition to veto a mother's decision to relinquish a child for adoption would be guided by its assessment of whether the father had taken on these responsibilities to the best of his ability, not by its estimate of the future "best interests" of the child as is often the case now.

A. Considerations Favoring Recognition of an Unwed Father's Right to "Grasp the Opportunity" to Become a Parent

In recent years a number of cases have pressed lower courts to define more precisely whether an unwed father has a right to an *opportunity* to establish a parental relationship with his child, and what the state must do to insure he has such an opportunity. At least one law review article has argued that all unwed fathers have a right to be notified by the state of the existence of their biological children before any adoption can proceed, and that the state may therefore require the mother to identify the father.[10] Some fathers

have claimed that due to the mother's lack of cooperation, they have not found any way to meet the Court's demand, articulated in Lehr, that he "grasp the opportunity" to develop a relationship with his child, assume some "responsibility for the child's future," and "enjoy the blessings of the parent-child relationship." [413 U.S. at 262] Should he have that opportunity? Should adoption proceedings be precluded until the father has been heard? What considerations should guide us as we try to evaluate such issues? To answer these questions we need to think about both the basis of claims for custodial rights and the relative claims of biological mothers and fathers outside of marriage.

In many discussions of the "rights" of biological mothers and fathers there is quite a bit of confusion between the argument that the biological tie itself creates a right to raise a particular child, and the argument that assigning custody of children to their biological parents promotes the exercise of parental responsibilities and minimizes state interference in family formation and intimate life. There is an inherent tension in liberal theory and legal practice between the state's obligation to protect families and individuals from intrusive state action on the one hand, and to promote children's welfare on the other. But since biological parents have a variety of incentives to care for their children to the best of their ability, assigning custody to them usually serves children's interests as well as adults'.[11] Moreover, begetting, bearing and raising children are among the exercises of freedom a liberal state should protect and facilitate. Courts have grappled with these important freedoms not only in custody cases like Stanley and Caban, but in decisions dealing with sterilization like Skinner v. Oklahoma that prohibited forced sterilization of criminals [316 U.S. 535 (1942)].[12] Entrusting biological parents with the custody of their offspring recognizes the importance of procreation and intergenerational ties to many persons' ideas of the good, or fulfilling, life. Assigning custody of children to their biological parents protects the privacy of parents and children alike and sets bounds to the exercise of state power. A liberal state does not ask at every birth "What will be best for this child?" and no

one proposes that children should simply be assigned at birth to the best possible or next available parents, without regard to who begot and bore them.

The importance of intergenerational genetic ties and the particular horror of state complicity in severing those ties without cause and due process has been seen in the continuing proceedings in Argentina to discover the biological families of the children born in captivity to parents who were "disappeared" by the government during the "Dirty War" of 1976-1982. When a pregnant woman in detention gave birth, her child was frequently placed with an adoptive family, sometimes a military household, sometimes a civilian family ignorant of the circumstances surrounding the child's birth. The efforts of the Abuelas de Plaza de Mayo (The Grandmothers of Plaza de Mayo) to identify and locate these children has seemed to virtually all observers appropriate and just, and Argentine judges have vacated the adoption decrees and returned the custody of these children to biological relatives more than a decade after the adoption took place.[13]

There are, therefore, good reasons to defend the custodial rights of biological parents, but they rest on a notion of "stewardship" rather than ownership or genetic entitlement.[14] In many contexts it makes more sense to talk of a child's need for and right to be taken care of, and of an adult's custodial *responsibilities* rather than rights. For the moment, however, I will show that even an approach focused on adults' rights does not imply without further argument and qualification that a biological father has a right to veto the adoption of his child.

The argument that similar criteria should be used to award custody to biological fathers and mothers alike rests on a conviction that parenthood is a significant good in the lives of men as well as women. One commentator speaks of this good as "a constitutionally-protected opportunity interest in developing a parent-child relationship."[15] Acknowledging that fathers might wish to raise their children for the same reasons mothers do--sharing intimacy and love, nurturing a child to adulthood, seeing one's parents' genetic inheritance survive into the next generation, passing on ethnic and religious traditions, and

so forth--the Supreme Court decided that "The private interest . . . of a man in the children he has sired and raised, undeniably warrants deference and, absent a powerful countervailing interest, protection."[16]

But what if each of a child's biological parents wishes to enjoy the pleasures of parenting, and the two cannot rear the child together?[17] The unmarried mother who wishes to retain custody of her child usually can do so; she is presumed to be a "fit" parent. The law embodies a presumption of maternal custody due to a combination of the legacy of the common law holding that nonmarital children are ***fillius nulli***, social attitudes assuming that mothers will provide for children better care than fathers, and high rates of desertion and nonsupport by fathers. If a man's paternity has been established, he has rights of visitation (as well as obligations of support). If the father thinks the mother is not doing an adequate job raising the child, he can ask the court to transfer custody to him. If an unwed mother does not identify the father, he can nonetheless seek recognition of his paternity, assume support obligations, and be awarded visitation, although most unwed fathers do not make these efforts.

If an unmarried mother chooses to relinquish a child for adoption, however, the father's consent may not be required. Often a state will notify him and permit him to testify at the hearing held to investigate whether the adoption would be in the child's best interest. But even if he argues vehemently that the child's best interest is to be placed in his custody, the court is still free to terminate his parental rights and proceed with the adoption. Advocates of increased rights for unwed fathers argue that these standards must be changed: the state should be obligated first to try to identify the father before allowing any adoption to proceed, and second to allow a biological father, unless he is shown to be unfit, to take custody of his child when the mother has relinquished her rights.[18] In the absence of a challenge from the father, after all, an unwed *mother* undergoes no hearing concerning the child's best interest: she is given custody unless she is shown to be unfit. A commitment to gender-neutrality would argue that the law extend the same presumption

of fitness to an unwed father as to an unwed mother, and that the consent of both should be necessary before the child can be adopted. In a recent California case, Kelsey S., the California Supreme Court held unconstitutional a statute that gave unwed mothers and legally recognized or "presumed" fathers a greater say in pre-adoption proceedings to terminate parental rights than it gave to unwed fathers. The Court declared that the statute rested on a "sex-based distinction" that bore no relationship to any legitimate state interest once the child was outside the mother's body and she had decided to relinquish custody.[19]

The presumption of fitness for biological parents also avoids the dangers of subjective judgment and cultural prejudice that seem unavoidable in attempts to determine the child's best interest.[20] One supporter of an unwed father's right to custody argues that a best interest determination "is subject to abuse and may lead to paternalistic infringement on the parent-child relationship in the name of the child's welfare. Given the long waiting list of adoptive parents that exists today and the traditional preference for rearing a child in a two-parent home, a best interest test is a no-win situation for the unwed father of a newborn with whom he has not yet had the opportunity to develop an emotional tie."[21] In 1987 the Georgia Supreme Court explicitly rejected the best interests test in favor of a fitness standard on the grounds that it was presumptively unfair to compare the putative father with adoptive parents with whom the child had never lived. It held that "If [the father] has not abandoned his opportunity interest, the standard which must be used to determine his rights to legitimate the child is his fitness as a parent to have custody of the child. If he is fit he must prevail."[22] The fitness standard avoids the subjectivity of a best interest determination for an infant who has not as yet lived with an adult caregiver for any length of time, and applies the same standard to biological fathers as to biological mothers.

But the question of whether the father shall have a right to custody of his newborn infant is not about paternal rights *tout court*, but also or alternatively about an unmarried woman's authority to decide who shall take custody of her newborn child. For the father to assume custody, the mother's expressed will concerning the child will of necessity be

over-ridden. Arguments that a father should be able to veto the adoption decision of the mother and assume custody unless proven to be unfit--or at least be entitled to a hearing as to the child's best interest--run up against counter-arguments that the courts should defer to an unwed mother's wishes concerning placement of her child. It is to these considerations that we now turn.

B. Problems with "Equal Protection" Arguments for Fathers' Rights

Advocates for unwed father's rights to custody of their children who base their claim on the symmetrical relationship of biological mother and father to their child fail to give adequate consideration to the broader contexts in which decisions about sexual, procreative and parenting decisions are made. For example, arguments in favor of the "fitness" standard for unwed fathers falsely assume that once the biological mother has surrendered the child for adoption she has no further relevant wishes with respect to custody. Defenders of an unwed father's right to veto an adoption often contrast what they portray as his laudable desire to assume custody and to care for the child with the mother's uncaring decision not to raise the child herself. The image of the "bad mother," and the assumption that if the mother chooses not to raise the child, she must be indifferent about who does, hover just beneath the surface of such depictions. But relinquishment of the newborn for adoption is not a sign that the mother does not care for the child; on the contrary, in many cases women agonize over the adoption decision and try to make certain to do what is best for their offspring.[23]

A woman's decision to place her child for adoption also does not mean that she is indifferent about the question of who raises the child. On the contrary, her choice of an adoption agency or private placement reflects her judgment as to who will be an appropriate custodian for her child. The fact that the mother makes the decision to place the child for adoption rather than to relinquish the child into the custody of the father undercuts his claims that he should be preferred to adoptive parents because they are "strangers" to the

child. If the mother has had very little contact with the father beyond the act of intercourse that led to her pregnancy, the father may be as much a social "stranger" to her and the child as the adoptive parents, and his claim rests on genetics alone. And if the mother has known the father over a considerable period of time, her unwillingness to make him the custodial parent needs to be examined to see why she feels as she does. Contrasting the biological father's rights to those of strangers obscures the fact that the fundamental or precipitating disagreement about custody is not between the adoptive parents and the biological father, but between the two biological parents.

Why might a woman oppose a biological father's wish to assume custody?[24] Many advocates of an unwed father's right to veto an adoption ignore the question altogether, assuming that once the mother has surrendered her parental rights she is (or should be) indifferent as to who assumes custody of the child. But an unwed mother might have various reasons to prefer adoption to placement with its biological father. She may prefer that the child be raised by an intact, two-parent family than by a single man. Given the opprobrium that still attaches to unwed motherhood (despite a growing acceptance in some communities) she may wish to seek the anonymity of adoption. She may have become pregnant after a "date rape" that she did not prosecute. She may fear that the father will use the child as a way to continue some form of relationship with her against her wishes, and might press her to contribute to the support of the child.[25] Whatever her reasons, it is clear that she may have thoughts about the placement of the child, and not simply have decided not to raise it herself.

Are there any reasons to weigh the mother's wishes about who shall (or shall not) take custody of the child more heavily than those of the father? One plausible consideration is that at the time of birth the relationship of father and mother to the child is neither biologically nor socially symmetrical. She has borne the child for nine months, activity for which there is no precise male analog; indeed, no one else (for example, a lesbian life-partner) can perform functions analogous to those of gestation. The biological mother's

"expectant" state has affected both her own physiological experience and the ways in which others view and interact with her.[26] The Supreme Court has recognized the significance of this asymmetry between mother and father during pregnancy by holding that even a wife is not required to notify her husband or obtain his consent before getting an abortion.

The fact that the biology of human gestation gives the mother the primary role in the child's prenatal care might suggest reasons to have the mother's will prevail when she chooses to place her newborn child for adoption. In writing about custody decisions after parents divorce, Martha Fineman argues that gender-neutral standards do not adequately protect women, and advocates use of a "primary caregiver" standard; her arguments are relevant here as well.[27] Fineman points out that the usual standard used to adjudicate custody disputes is the "best interest of the child," but that this standard frequently disadvantages mothers by looking to the likely future financial resources of father and mother. It would be more appropriate (both in terms of fairness and the child's emotional well-being) to look rather at who has actually given the child physical and emotional care up to the present, Fineman asserts. The "primary caregiver" standard were applied to custody of newborns, suggests that the mother who has borne and given birth should make the custody decision concerning the infant. Mary Becker, for her part, argues that mothers are so frequently the primary caregivers of their children that it makes sense to adopt a "maternal deference" standard: "When the parents cannot agree on a custody outcome, the judge should defer to the mother's decision on custody provided that she is fit, using the 'fitness' standard applicable when the state is arguing for temporary or permanent separation of parents and children in intact families."[28] Becker is not terribly worried that giving primacy to the mother's wishes might in some instances permit a woman to deprive a caring father of custody: "A maternal deference standard would recognize that mothers, as a group, have greater competence and standing to decide what is best for their children . . . than judges, fathers, or adversarial experts. . . . Mothers will sometimes make wrong

decisions, but in the aggregate they are likely to make better decisions than the other possible decision makers."[29]

There are, however, differences between deciding about custody after divorce and deciding whether a mother should be free to make the adoption decision against an unwed father's will. While the mother has been the "primary caregiver," gestational activity is not the kind of consciously controlled caregiving that parenting of children involves and that the father now seeks to assume. In addition, while the divorced father who is denied custody will still be able to visit his child, the unwed father whose child is adopted loses all parental rights. Moreover, precluding out-of-hand the claims of fathers who have tried to take responsibility for their offspring fails to reinforce men's paternal obligations in a society that desperately needs men to take such responsibilities seriously, and may undercut the principle that parental rights should be grounded in demonstrated commitment to a child's welfare. The fallacies in arguments for unwed fathers' custodial rights that rest on his genetic ties to the child and on the irrelevance of the mother's wishes once she has relinquished her custodial claims, do not make all assertions of unwed fathers' claims to custody of their children invalid. While the father's genetic link does not *per se* give him parental rights, it becomes a reason *to look to see* if he has attempted to assume responsibility for the child, and has done so without interfering with the mother's well-being while pregnant, and if so--and only if so--to accord him parental rights.

III. Care and Responsibility as the Basis of Parental Rights

Neither granting unwed fathers custody as long as they are "fit," nor granting unwed mothers an unqualified right to place their children for adoption against paternal wishes provides a fully satisfactory basis for thinking about the custodial claims of unwed parents. Arguments favoring a father's "right to know" (that is, to be informed by the mother or the state) of the existence of his child and to be awarded custody unless shown to be unfit rest on flawed arguments about both the role of biology in establishing parental

rights, and the appropriateness of a gender-neutral standard applied to custody decisions concerning newborns. Law and social policy in this area must walk a very fine line between adopting false gender-neutrality by treating men and women identically on the one hand, and reinforcing gender stereotypes on the other.[30]

The alternative to the traditional "best interest" test need not be either recognition of a father's right to custody based on his genetic tie alone, or maternal deference on the other. Rather, there must be stringent criteria for assessing the father's intention to take responsibility for and act as a parent to his child even prior to birth. A New York statute struck down by the New York Court of Appeals in Matter of Raquel Marie X [76 NY2d 387 (1990)] tried to reflect the judgment that parental rights are rooted in lived relationship by stipulating that only a father who had established a home with the mother for six months prior to her relinquishment of the child for adoption could veto the adoption. But the statute was challenged by a father who had been unable to live with the mother, and the court held that the provision imposed "an absolute condition . . . only tangentially related to the parental relationship" and allowed a woman who would not live with a man the power unilaterally to cut off his constitutionally protected interest in parenting his child.[31] One supporter of that decision remarked that the New York court was right to "recognize that a father and mother must be permitted to demonstrate commitment to their child in different ways. Consequently, the court mandated that the father be given the chance to demonstrate parental responsibility for the child by doing everything that it is possible for him to do."[32] In a subsequent decision, Matter of Robert O. v. Russell K. [80 NY2d 252 (1992)], an unwed father sought to overturn the adoption of his son on the grounds that either the mother or the State had a duty to ensure that he knew of the child's birth, and that their failure to do so denied him his constitutional rights. The New York court acknowledged that "the unwed father of an infant placed for adoption immediately at birth faces a unique dilemma should he desire to establish his parental rights." His opportunity to "shoulder the responsibility of parenthood may disappear before he has a chance to grasp it." [262] But

although Robert O. acted as soon as he knew of the child's existence, the adoption had been finalized ten months previously. "Promptness," said the Court, "is measured in terms of the child's life, not by the onset of the father's awareness." Robert O., having failed to ascertain whether the woman with whom he lived was pregnant, forfeited the right he would have had to an opportunity to manifest his "willingness to be a parent." The Court was, I think, correct in its insistence that the burden is on the man who would assume responsibility for raising a child to know of its existence. The difficulty of devising criteria by which to judge whether he has made every reasonable effort to do so when the mother is uncooperative is, however, evidenced by the fact that since the Court's decision in Matter of Raquel Marie X the New York State legislature has failed to devise stipulations that would allow a father to demonstrate the existence of paternal concern prior to the child's birth.

What would an unwed father need to do to demonstrate that he had done "everything that it is possible for him to do?" At the least, the father would be responsible for trying to ascertain whether a woman with whom he had had sexual intercourse was pregnant. (By contrast, one defender of unwed fathers' rights, seemingly oblivious to any considerations of privacy, proposes a jail sentence of up to two years for a woman who refuses to name the father of her child when surrendering the infant for adoption![33]) He would also need to register his desire to assume custody prior to the child's birth on a putative father's registry. And he would need to provide financially for mother and child to the best of his ability, or place money for their support in an escrow account, savings account, or with a friend or family member, and make other provisions for the child. To have the right to veto an adoption a father would have to demonstrate the will to assume the responsibilities of parenthood from the earliest possible moment. And he would have to show that the mother's objections to his assuming custody were unfounded and that he had not harassed her or impaired her ability to care for herself or the child she was carrying. The requirement that he take action prior to the child's birth not only signals his desire to be

a parent, but facilitates meeting the need of the infant to be placed in a permanent home as soon as possible after birth.

Unwed fathers' efforts to block mothers' decisions to place their children for adoption also point to the desirability of other kinds of changes in the way the law deals with family formation. Some unwed fathers seem motivated by the fear of losing all opportunity to know children they have sired, just as some birth mothers have also testified to the pain they experience at losing contact forever with children they have relinquished for adoption. Adoption registries that allow adopted children and birth parents to contact one another when the child has reached his or her majority seem to have been helpful to parents and children alike. They allow for the simultaneous recognition of the importance of both genetic and social parenting, and in doing so undercut the suggestion that something about adoption is shameful and is best kept hidden.[34] Such registries also take the perspective of children who want to know their biological forebears into account, without weakening either the legal rights and responsibilities of the social (adoptive) parents or the primacy of the emotional bonds between adoptive parents and children.

Conclusion

This analysis of disputes over paternal custody of nonmarital newborns makes it abundantly clear that the language of individual rights and "equal protection," so central to liberal political theory and constitutional law, is not well-suited to dealing with complex issues of parent-child relationships.[35] While notions of maternal or paternal rights are not useless (for example, they allow us to think about limits to state intervention), they tend to focus attention on an adult *individual*, whereas parental issues involve two adults and a child, and the relationships among them.[36] Legal and social discourse alike must put the lived relationship between parents and between parent and child, not individuals alone, at the center of the analysis of parental claims. In particular the language of a father's "right" to custody of his infant child based on his genetic tie obscures the complexity of the

relationships involved in human reproductive activity. Unwed men who wish to be social parents to their offspring need to establish caring relationships from the earliest possible moment. That involves taking the trouble to find out if a woman with whom they have had sexual intercourse is pregnant, providing her with support during the pregnancy to the extent they are able to do so, and informing the state as soon as possible and certainly prior to birth that they wish to assume parental responsibility. Only by looking behind abstract assertions of individual rights to examine the relationships of dependency, reciprocity, and responsibility involved in family relationships will we be able to approach a world ~~both~~ dedicated to achieving both lived equality between men and women and committed parents for every child.

> Various reasons have been proposed for considering the unwed mother a more natural guardian than the father. These include: (1) the mother is more easily identified than the father; (2) she is biologically better suited to care for and nurture the child; and (3) the natural bonds of love and affection for the child are stronger in the mother than in any other person.

[5]Also important was the rise in both social and judicial attention to childhood and its particular needs. See Zainaldin, etc.

[8]Justices O'Connor and Kennedy rejected Scalia's assertion that the proper methodology for discerning what interests are protected by the due process clause is to look at "the most specific level at which a relevant tradition protecting, or denying protection to, the asserted right can be identified." Justice Stevens also concurred in the judgment, asserting without much apparent basis that because Michael could have obtained visitation rights as a "nonparent" he did not need further protection.

[9]It is interesting to note that despite the fact that they arrived at opposite conclusions, both Scalia's and White's opinions adopted male-centered models of the basis of parental rights. Scalia looked to the law to protect the paternal rights of married men by basing those rights on a man's legal relationship with the child's mother. White grounded paternal rights in a biological tie established by blood tests, regardless of a man's legal ties to the mother. Both opinions, then, made it unnecessary for the law to ascertain the mother's wishes or intentions with respect to paternal claims to her child.

By contrast, and although they too reached opposite conclusions, both Stevens and Brennan considered the interests and actions of the mother to be relevant to establishing paternal claims. For Stevens, the inherent biological and sociological differences between care of the fetus by woman and man justified different treatment of parental rights at the time of birth. Brennan, for his part, emphasized the child's as well as the adults'

experience. He suggested that once a relationship between father and child exists, the mother cannot then exclude an otherwise fit father from being heard with respect to his paternal rights. Brennan, however, did not consider the fact that Michael had established his relationship with Victoria *because of* Carole's actions: she told him he was the likely father, she suggested the blood tests that established the high probability that he was Victoria's father, she lived with him and together with him held out Victoria as their child. In his written opinion Brennan did not consider whether an unwed father like Michael should have the right to challenge the paternity of a child born to a married couple against the will of *both* husband and wife. Nor did he consider the extent to which Michael's situation was like or unlike that of an unwed father of a child born to an unmarried woman. But if, as Brennan thought, nurturing activity plus biology is necessary to establish parental rights, the question remains whether the law must provide an unmarried father an opportunity to demonstrate his commitment if the mother does not allow him access to the child. Such a case might arise not only when a married woman conceives a child by a man other than her husband, but, more frequently, when an unmarried mother wants to raise her child but have nothing to do with the father, or wants to place her newborn for adoption and is opposed by the biological father.

[17]If the parents are married, the state by-and-large will not intervene in their disputes; but if they separate or divorce and cannot agree on a custody arrangement, a court will use the criterion of the "best interest of the child" to decide the matter for them. Sometimes they will share physical custody, with the child spending roughly even time with each parent; other times joint custody will entail shared decision-making but the child will live with one parent. More frequently, one parent receives custody and the other visitation rights.

Erickson, "Neither Abortion nor Adoption: Women without Options," paper presented at the American Association of Legal Studies (AALS), San Francisco, CA, January 6, 1990, 39 note 22.

[24]Nancy Erickson, "Neither Abortion nor Adoption: Women without Options," paper presented at the American Association of Legal Studies (AALS), San Francisco, CA, January 6, 1990" presents a number of reasons it might be in the state's interest to allow a mother to relinquish her child for adoption over the father's veto.

[25]Waiving child support for a woman whose decision to place a child for adoption is overturned by the biological father would introduce an asymmetry into the law, because the support obligations of an unwed father is never waived because he does not wish to be a father. Such an asymmetry seems justified by the fact that imposing support obligations on an unwed mother who is thwarted in her wish to have the child adopted could lead other women to choose abortion, even when they would otherwise prefer to bear the child to term.

> Perhaps because we have not spent enough time studying the warriors of the past, we do not have a psychology with which to comprehend our own warrior caste.
>
> Barbara Ehrenreich

Introduction: Recruitment

A modern society's warfare machine, like its other agencies, needs to be intelligible and appealing to recruit members. However, because in this agency death is on the agenda, there are extraordinary delicacies involved in the representation of the work. Despite these delicacies, however, the general approach to recruitment has been comparable with other agencies. Social and cultural codes are the predominant mechanisms to locate the job. Roughly speaking, two different kinds of codes seem to operate in the context of military recruitment. One kind is rationalistic or utilitarian. The appeal is a match between what are projected as the recruit's personal career objectives and the ways that the military unit can provide resources and a context for achieving them.

There is a venerable historical tradition associated with this kind of appeal. For example, recruitment into the Roman army promised land in exchange for military service.[1] More recently, the utilitarian appeal has been characteristic of U.S. Army recruitment ads on television, which urge you people to join the Army now to obtain financial support for college later.

The other kind of appeal is more ontological or identity-related. It describes the military unit as a place in which the self can be realized or perfected. Ideals of masculinity in general and particular aspects of the maleness tend to be emnphasized - for example, qualities such as strength, toughness, perserverance, and individual distinction are valorized and offered as what are to be achieved. The prize is not something exogenous for the self to use but the making of an exemplary self. A way to <u>be</u> is what is offered rather than the fulfillment of preferences or the acquisition of things valued.

In this second domain of codes, the effectiveness of military recruitment advertising has to be a function of the plausibility and centrality of the codes with which it identifies itself (as well as those negative ones from which it distances itself). In a modern state society such as the U.S., as contrasted with the traditional, tribal society, military recruitment is not wholly facilitated by the surrounding culture, because in modernity, ontological interests are fragmented. Military codes of daring, honor and discipline are opposed by other cultural codes.

For example, unlike the case of Mesoamerican cultures such as the Aztecs, for whom military honors were more or less universally comprehended and applauded, the ontological or identity commitments of the modern military are contentious, subject to critique, and disjunctive with other dimensions of distinction within the

society. This has been especially the case since the U.S. experience in the Vietnam War, which dealt a serious blow to militaristic values. Although militarism has made somewhat of a comeback since the recent Gulf War, this fragmentation neverthless provides the current context for the recruitment of what is perhaps the most ontologically oriented of all the military services, the U. S. Marines, whose identity preoccupations have been foregrounded in their recruitment appeals. Below, their explicit television recruitment spots as well as the implicit recruitment that stems from the representation of "the Corps" in films are addressed. However, to comprehend the recruitment appeals, we have to understand the differential significance of the various forms - oral, textual, and visual - with which the significance of warfare has been produced.

A convenient place to begin a consideration of the interaction of cultural codes and forms in military recruitment is Peter Weir's treatment of the Australian participation in WW I, in his film, Gallipoli. Its opening scenes focus on the cultural context and treat the Australian version of a preoccupation with achieving manhood. The story begins as Archie, an aspiring sprint champion, is being coached by his uncle (a former "manly" adventurer), and after a training scene in which the uncle behaves very much like a drill sargent,the narrative cuts to a challenge to Archie from other young ranch hands with whom he works. "Girls run, men box," says one contemptuously. A contest between Archie on foot in a race against the taunter on horseback ensues, and it emphasizes the masculinity agonistics that surround the interactions of all the young men.

What are also notable, however, are the forms that translate the masculinity codes within which their self preoccupations function. One is oral and the other textual. The crucial scenes with regard to the interaction of the masculinity codes and forms begins with a conversation in which Archie's uncle tries to dissuade him from joining the army, saying he is under age. Archie protests that his uncle was also at least this young when he went out as a young adventurer. Shortly afterwards the form shifts from the oral - stories of his uncle's adventures - to the textual. Archie overhears his uncle reading Kipling's Jungle Book aloud to his younger syblings. He walks into the room just as his uncle is on the part where Bagera (the bear) is saying to Mowgli, "Now I know that thou art a man and a man's cub no longer."

Immediately afterwards, we are still in the domain of books as Archie is in his room opening Every Boy's Book: Sport and Pastime into which he has tucked a newspaper clipping with a report on the British campaign in Gallipoli, right next to a page with a heading: "Splendid Gallantry, Magnificent Achievement." As Archie traces his finger around Turkey, he is seemingly locating the place where his manhood can be tested (as his boyhood is left behind). And not incidental to this process is the newspaper whose daily existence provides a textual mechanism for Archie to identity himself as an Australian and member of the Commonwealth as well as to identify Turks as his enemies.

The same textual form structures the next scene in which the other young ranch hands are sitting around as one reads a report in the Western Australia press about the war on the Turkish front. After one reads an account of the Turkish technique of digging pits with false bottoms to catch foot soldiers, another shouts "bastards," and adds, "That it, I'm going to join up," and another adds "me too," and "how about you," which is shortly followed by a "Hey, we could all join up together." And lest we have forgotten the way in which masculinity is on the agenda, one who is undecided for a moment is reminded: "Hey, the girls go wild over a uniform."

Death as well as manhood was on the agenda however, and ultimately Archie and many of his young friends die in Turkey, driven there by, among other things, the cultural codes that motivate them to become men by finding a violent adversary and by the way in which the textual form, the print media, help them to forge their identifications with an extended "imagined community:" Australia and the British empire.[2]

Death is also on the agenda for the contemporary U.S. Marine recruit. For example, during the Vietnam War one in every 60 Marines serving (and this counts non-combattants) died in combat, a death rate of more than double that of Army personnel and roughly 17 and 19 times the death rate of Air Force and Navy personnel respectively.[3] As assault troops who are highly at risk, not only during assaults but also afterwards, for they are relatively ill-equipped to hold territory once it is taken, Marines are often a virtual suicide squad (as were many of the Australians in Gallipoli). The manhood appeal, which is foregrounded in Marine recruitment, thus has a similar consequence, a deadly ending.

However in contrast with the recruitment of Australians during World War I, the contemporary Marine is recruited within a period in which visual forms have tended to displace textual ones. In this context, the analysis turns to one of the more remarkable television recruitment spots for Marines. It was run frequently during the football season in the fall of 1992, and continues to run, in various versions, adjacent to sports news telecasts. It has been doubtless positioned to reach the maximum recruitable audience of young men, whom it asks to be part of a group identified as "a few good men," (the Marine recruiting slogan in recent years).

In its most elaborate version, the scene opens on an Arthurian-looking wizard in black, carrying a huge sword (the costumes are taken from the film Excaliber - see Figure 1).[4] A fadeway shows that he and other white (or silver) and black figures are on a chessboard in a desert landscape. The black wizard propels himself magically (there are no strides; he seems to be almost on wheels) and he strikes down the flag holder of the white side, who disappears in a magical poof. The scene cuts to the white king who gestures for a retaliation. A white knight on horseback goes into action and vanguishes the magician, who also disappears at a laser-like swordstroke (reminiscent of scenes from either starwars films or nintendo video games).

Next, a female magician/wizard in black shows up and directs various medievally costumed foot soldiers in the direction of the

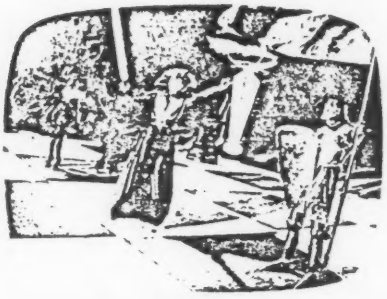
Marines

PUBLIC SERVICE ANNOUNCEMENT

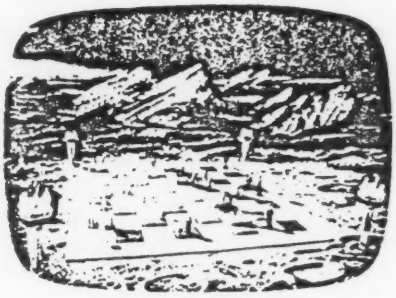
Title: "Minority Chess"
Code #: ZJWB 1453/1802

Lengths: :30/:20

MUSIC: (Open with a majestic piece with undertones of conflict.)
SFX: (Piercing, metallic-like punctuators are heard throughout.)



MUSIC CONTINUES



MUSIC CONTINUES

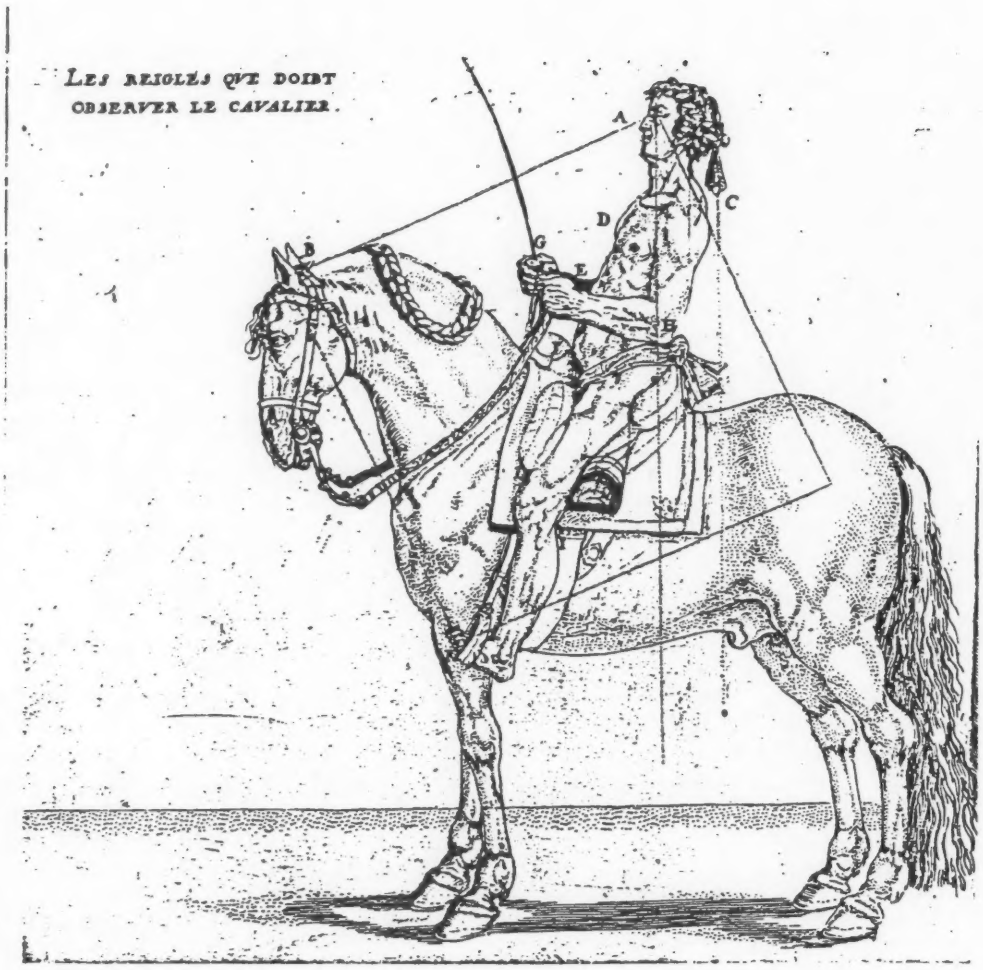
white knight. These soldiers are also vanquished with swift sword strokes, and as the white knight moves to meet their attacks, a long view is shown to indicate that he is advancing in an orderly patterned way across the chess board; his movements conform to the pattern of the contest. After the white knight vanquishes various kinds of foot soldiers, the female black wizard raises both arms as if summoning cosmic forces (of evil), and this is followed by the entry of a black knight on horseback swinging a mace against the white knight's sword (a venerable scene from film culture - both Ivanhoe and Excaliber among others).

Althought the female wizard keeps supporting the black knight with various gestures, he is also vanquished in a poof as a voiceover says, "to compete, you've got to be strong." The white knight then approaches the black king with sword pointed toward him and the king bows in a gesture of capitulation, showing a skull on his crown (another symbol of evil), as the voiceover adds, "to win you've got to be smart" (which accords with the chess imagery). The the white knight rears back on his horse and draws lightning with his raised sword (the forces of good from the cosmos). The camera then closes on the armor clad arm which changes from armor to a modern marine dress uniform. Then, with the camera drawing back, we see a young Marine doing parade maneuvers with his sword. A shift to a profile shot shows the young marine is standing very stiff and straight (particularly his neck), as the voiceover says, "maybe you can be one of us: the few, the proud, the marines."

Two different domains of codes must be addressed to appreciate the conveyed meanings of the recruitment spot. One is the set of codes from which it is constructed, and the other is the set belonging to the culture of the viewers, helping to mobilize their interpretive reactions. Looking first at the spot's construction, what are perhaps most evident are the historical codes. The costumes of all the figures and, in particular, the stikingly upright posture of the white knight evoke those past ages in which soldiering and individual moral character were inseparable. The individualistic nature of the fighting reflects a tradition of individual distinction in battle going back at least as far as ancient, pre-hoplite Greece, when combat took place between exemplary champions. Battles were, as Jean-Pierre Vernant has noted, "a mosaic of face-to-face duels between promachoi (champions) with the purpose of producing "a wholly personal superiority," in contrast with the subsequent age of hoplites (citizen soidliers), who massed together in phalanxes, which experienced collective victory or defeat.[5]

The other notable historical code connects the bearing of the knight with a history of body culture associate with being a soldier (see Figure 2). As Georges Vigarello has noted:

> From the Middle Ages on, every failure of physical uprightness has been attributed to two main categories: the stigma of deformity, sanctioned by the attention given to strength and aesthetic qualities, and the lack of proper deportment prescribed mainly by



The rules that the rider should observe. From *Le manège royal de M. Pluvinel*, Paris, 1623.

Figure 2 Source: George Vigarello, "The Upward Training of the Body from the Age of Chivalry to Courtly Civility"

socialized ethics.[6]

Michel Foucault has offered a similar observation about the semiotics of the soldier, which he identified as persisting into the seventeenth century. The soldier's body comportment, "bore certain signs of his strength and valour;" he displayed "a bodily rhetoric of honour."[7] The extraordinarily strict control over bodily posture, which is characteristic of the Marine's training and of their representations of who they are thus goes back to the era in which outward deportment was supposed to say something about the inner depths.[8] Inasmuch as the body posture continues to convey these codes, recruits are being invited to join, at once, the strong and pure of form and the morally proper. And this recruitment spot maintains a continuity of the military body from the erect posture of the knight on horseback to the erect posture of the young Marine, whose extraordinarily stiff and straight neck has stood as the primary coding mechanism for strength, honor and morality since the middle ages.[9] The imbrication of the historical and bodily coding provides the central tropes of the spot's expressed meaning. Not only is the Marine strong and morally correct but also part of a noble historical tradition (it was indeed the noble caste who followed these strict rules of posture). There is therefore a continuity between the noble courtly caste and the modern marine. Both operate with an "ideal of physical violence" with parallels in [their] posture."[10]

Significantly, the recruitment spot emulates a second important dimension of the strict rules governing the deportment of the courtly noble caste. Vigarello points out that by the sixteenth century, books on deportment for the nobility established not only "a stricter control over posture and the right position" but also strictures on the spaces of that deportment. He quotes one of the influential treatises from that century:

> The plan for a perspective is a checkerboard: in the construction of sketches we start with a regular grid pattern, and identical rectangles juxtaposed to each other generate, as they become more distant, similar triangles. Nothing is better suited to marquetry.[11]

Viewed in historical perspective the chess board in the spot has resonances beyond the metaphor of that game. The Marine's discipline has a noble history not only through its body culture but also through its disciplined uses of space.

The presence of other strong codes serve to overdetermine the morality standing of the Marine. In addition to the nobility with which correctness and deportment is associated, a good-evil polarity permeates the rhetoric and narrative structure of the spot. The white knight versus black sorcerers, soldiers and knights is of course coherent with the chessboard metaphor, which locates the Marine in a strategic situation, reinforced by the voiceover saying "you've got to be smart." But in addition the white-black code is unmistakeably a good-evil one, which is underscored by two additional signs, one obvious and one subtle.

The obvious one appears near the end of the brief narrative, when the black king bows in capitulation and reveals the skull on his headgear. The subtle one is a gender code, represented by the the choice of a sorceress instead of a sorcerer to direct the attacks against the white knight. While her upraised arms seem to be summoning an extrawordly evil source, the fact of her gender cannot be ignored. The evil beguiling woman of the other tribe appears often in the Old Testament (e.g. Delilah), and from the Arthurian legends, there is Merlin's counterpart, the evil sorceress Morgan LeFay (more likely the explicit model for the recruitment spot).

However, there is another level at which an oppositional woman has meaning in the context of recruiting Marines. Since ancient times the meaning of the soldier's strength has been constructed through its opposition to the feminine, and the unisexuality of military units has been jealously guarded. In the case of the U.S. military, the Marines were the last to let women maintain active status in peace time (1948).[12] Speaking of another warrior caste, the German Freikorps, Barbara Ehrenreich has noted that "their perpetual war was undertaken to escape women," and even the battlefront nurse was "a threatening intrusion in the unisexual world of war."[13] For such a warrior caste, (Freikorps or Marines, who are a throwback to such castes) being "real men," is paramount, and as Klaus Theweliet has put it in relation to the Freikorps, their attitude was that "real men lack nothing when women are lacking."[14] The gender code in the spot therefore has important resonances with the self-understanding of Marines (a theme to which I return in a discussion of films below).

What becomes especially significant at this point, however, is the unreality of a spot that seeks to recruit "real men." The various inhibitions of the spot address various necessary political delicacies and, at the same time represent a frustration that modern warriors experience. One important delicacy relates to the white-black, good-evil polarity for an agency that must recruit black, African-Americans. This problem is handled in one version of the spot, in which the cut from the knight to the fulldress young Marine doing parade maneuvers reveals a black Marine (se Figure 1 above). However, the larger political issue has to do with the spots inability to refer to specific enemies and hostile territories. Given the breakdown of historical partisanships or traditional enmities, geopolitical spaces and national identities can no longer be unambiguously allocated to friendly and unfriendly categories. Marine recruitment spots must therefore eschew geopolitical and national partisanship rather than offend various foreign and domestic sensibilities. The chess board and mythic figures provide a visual representation that codes the Marines in terms of a contest, and power, morality, and the disciplinary postures and structures for the shaping of a virtuous self are involved, but the resources for specific enmities, which make possible warfare as a vocation, are unsupplied. The spot thus manifests what has been called in a similar context "visual desperation." James Elkins uses the expression to treat the

conditions of possibility for seeing bodies of unfamiliar creatures, arguing that it is through analogic thinking, guided by linguistic constructions that comprehensibility can be achieved in the absence of familiar models. Elkin's field of application is microscopy in which the shapes of what are visualized become kinds of bodies through analogies without which "we might see meaningless aggregates."[15]

If we adapt this insight to a treatment of the desperation involved in creating visible enemies to represent what cannot be seen, we can recognize the analogic strategy in the spot. The resort in the spot is the same as what Elkin's discerned in the resolution of the visual desperation of the microscopists, to rely on "analogies...deep-rooted in our habits of seeing."[16] In this context, it is not surprising that the visual culture from which the analogies are drawn are Hollywood feature films. Where else is can one find such a culture-wide shared domain of visual codes and narratives?

This raises the issue, of course, of which films. For example, why the Arthurian legend, conveyed to the modern youth culture through such films as Excaliber, rather than recent military adventure films. Apart from the above mentioned sensibility problem - it is difficult to fix on enemy territory and enemy identities in a world of ambiguated antagonisms - the last generation of war films in the post-Vietnam era offered visions of war that were morally ambiguous, tending to create what two critics have called "dialectical disorientation," whereby what is shown is "a confrontation between two powerful, incompatible and complementary world views"[17] which has the effect of undermining the mythologies of war that work toward recruiting warriors.

By contrast, the Arthurian analogy reasserts the mythologizing of war charateristic of films of the pre-Vietnam era without evoking the interpretive controversies that any representation of Vietnam military action would invite. And the various additional visual tropes the spot mobilizes connect up with all of the societal myths that construct warfare as a sacred mission against an unambiguously evil adversary, a mission, moreover, which must eventuate in the glorification of the individuals who undertaken it.

Now, turning to the second domain of codes through which the spot achieves its meanings, we must coinsider the culture of the viewers. Perhaps the most important dimension of this culture is succintly expressed in the above observation that contemporary recruitment confronts an increasingly visual culture. More specifically the visual forms of modernity mediate not only recruitment but also the contemporary experience of war itself. For example, the Vietnam correspondent, Michael Herr and his media colleagues had trouble distinquishing experiencing the war from being media spectators.

> A lot of things had to be unlearned before you could lean anything at all, and even after you knew better you couldn't avoid the ways in which things got mixed, the war itself from

> those parts of the war that were just like the movies.[18]

And Herr notes in addition that the combatants had the same difficulty:

> You don't know what a media freak is until you've seen the way a few of those grunts would run around during a fight when they knew there was a television crew nearby; they were actually making war movies in their heads, doing little guts and glory Leatherneck tap dances under...We'd all seen too many movies, stayed too long in Television City, years of media glut had made certain connections difficult.[19]

The recruitment spot resonates with the contemporary youth visual culture not only because it evokes a genre of adventure film - a cross between the Arthurian legend in Excaliber and the laser swords stroking of Darth Vader and his young adversaries in the Star Wars films, but also because it resembles a Nintendo game, a visual genre in which is a genre the current young generation is broadly and deeply involved. The spot therefore contains the many of the genre's necessary for it to be both intelligible and absorbing. The visual tropes translate a complex set of cultural imperatives - issues of duty, heroism, manhood, good versus evil, and alertness to the seductive dangers of women - into simple visual signs able to capture a visual audience whose attention span is episodic, given the architecture of the viewing venue, the multi-stimulus home as contrasted with the movie theater, sealed off from disturbing, exogenous signs.

In Pursuit of the Real

However compelling the recruitment appeal might be by virtue of the readability of its forms, it must nevertheless function in the context of significant domains of cultural competition. One of these, ironically, is the culture of the Marine Corps itself. As the quintessential warrior caste, the Corps has been notoriously impatient with metaphor, simulation and symbolic antagonism. The other side of the coin of its pursuit of creating real men has been its drive to have real enemies in real combat situations against which to try and test these "men." It has been the dominant thematic in the many of the more pious and sacrilizing marine stories in Hollywood films (to be treated below), and it finds expression in official Marine journalism, which in recent years has celebrated the finding and maintaining of reality in the Carribean. One of the venues is Grenada and the other is Cuba.

For example, writing a history of the Marine's Grenada assault, "Operation Urgent Fury," the Brigadier General/author noted with pleasure that "the near coincident Beirut deployment and Grenada intervention presented us with the problem and opportunity of collecting operational history in real time."[20] Of course mere episodes provide less purchase on the real that an enduring enmity,

and with the end of the Cold War, Cuba takes on a greater significance as a piece of reality, the only consistently non-simulated enemy. The lure of the "real" dominates this report on "GITMO" (The Guantanamo Bay, Cuba Marine base) by a Marine journalist:

> The Marines on the front line have a respect for what's on the other side of the fence. "In the fleet (FMF), you do a lot of training but training's not real. The Marines have a real mission every single day," said SSgt. Randy Shouse, a guard chief from one of the rifle security companies. With the Cuban economy collapsing and border activity increasing every year, the defense force Marines must keep up their guard even more. But for many of them it's exciting. As Shouse described, the mission is real and for Marines fresh from boot camp and the School of Infantry, the reality of the job is motivating.[21]

In addition to the struggle that a drive for the "real," which is endemic to Marine culture must encounter in a modern military that reproduces itself primarily through siumulation strategies, is the struggle, during Marine training, that a warrior caste must undertake within a social and cultural context containing both specific anti-military attitudes and practices and more generally centrifugal and fragmenting value stuctures that are anti-disciplinary. These difficulties underlie much of the action in the recent film, A Few Good Men (treated in the conclusion below). However, in order to underscore both of these dimensions of Marine agonism, it is appropriate to take a detour to the "real" halls of Moctezuma and examine the Aztec military caste and its practices before returning to examine the way the agonism has been played out for different generations of Marines as represented in films.

From the Halls of Moctezuma

Aztec military recruitment experienced none of the difficulties common to the contemporary Marine Corps. This is primarily the case because, as noted above, Aztec culture as a whole served military recruitment rather than placing centrifugal pressures on it. Most striking about recruitment for the Aztecs was its pervasiveness. Under Moctezuma in the sixteenth century all commoner youth ten to eleven years old went to a school that included military training.[22] Equally pervasive was the presence of military signs through Aztec public space. By the time a warrior had taken two captives, he went to the palace to receive a mantel with red trim from the king. For three captives he got a richly worked garment, and for four, a special war garment as well as a complete haircut.[23] As a result, Aztec public space was dense with military signs, for "status achieved in war was marked by the honors one received, the way one's hair was worn, the jewelry one was entitled to wear, the clothing one wore in peace, and the arms,

armor, and insignia one wore in war."[24]

Amplifying the public recognition of the value of military engagement that these decorations conveyed were other elements of Aztec culture. For example, as one commentator has noted, rather than being a respite from the violence associated with policing the tribute economy and other operations comprising their military dominance, their poetry was "deeply implicated in the carrying out of Aztec imperial policy."[25] And the songs were "also an important part of the education of young warriors. Songs and dances were taught in the calmecac, houses where adolescent boys lived as they trained to become warriors, and the boys spent the evenings singing these with older warriors."[26]

Not incidental to the complicity of Aztec music with Aztec militarism was the structure of composition and performance. In contemporary industrial societies, such forms as rock music are not wholly hierarchical because the class control over spaces of performance such as the concert hall has given way in modernity to airwaves and a proliferation of local arenas of performance.[27] In the case of the Aztecs, artistic genres were dominated by militarized classes. For example, there was "a professional system of composition, instruction, and performance, and with Aztec society increasingly dependent on, and organized around a state of on-going warfare, it seems plausible to assume that it was in this period (and in these circles) that Aztec poetry developed into the full and elaborate forms that are found in the surviving codices."[28] There was thus a wholly complicit genre of musical poetry that reinforced the status system organized around warfare. For example, seasoned warriors were honored as "eagles" and "jaguars," as this poem celebrates:

> Nobles and kings are sprouting as eagles and jaguars in Mexico: Lord Ahuitzotl is singing arrows, singing shields. Giver of life, let your flowers not be gathered!...You've adorned them in blaze flowers, shield flowers.[29]

For the Aztecs, then, unlike the modern state, which has separate military institutions, war was totally imbricated with the Aztec social body, and the various cultural forms served as implicit military recruitment. In a society in which warriors are trained by and reinforced by the central cultural codes, the warriors carry the realistic death-facing codes into and through battles. In state societies with separate military institutions and bureaucracies, the culture codes warfare not through its central beliefs and values, which are based on experience and are broadly learned through action (e.g. the way that most adult Norwegian men can converse knowledgably about going to sea), but through its fictional or fantasy-type genres. As a result, military leadership, i.e. the professionals, must take raw amateurs and impose new and unfamiliar codes on them, and they must do so against the culture, even though at the same time they employ some positive and negative cultural codes in the training (e.g. the notorious use of misogyny and homophobia by Marine drill

instructors to goad new recruits by questioning their "manliness"). In general what trainers must do is resist the noise of modern culture that is distracting, fragmenting, and increasingly anti-disciplinary.

If we pay attention to war films that treat the U.S. Marines, it is evident that since the post World War II period and wholly celebratory treatments such as The Sands of Iwo Jima, the tendency has been increasingly critical. This is especially the case with the post-Vietnam War genre with such films as Full Metal Jacket, which departs from the traditional heroic war story not only through what it shows - the more pointless brutal aspects of both Marine basic training and their violent encounters on patrol in Vietnam - but also through its avoidance of traditional narrative form. It is not a heroic story in part because it resists being a story, displaying various unconnected tableux rather than producing a narrative sequence from which one could derive a moral or political lesson.[30]

The traditional Marine story films have had an unambiguous theme. It is that inasmuch as the Marines are a separate, professionalized military agency, the training of a Marine requires a struggle against aspects of the larger society and its cultural forms. As noted above, however, the portrayal of this struggle has not been the simplistic Marine codes versus the other social codes model. At the same time that other cultural codes are seen as centrifugal, fragmenting, and anti-disciplinary, they are opportunities as well as impediments, and Marine trainers and models make positive use of them.

Because the emphasis here is on the marketing of the Marines and the implicit recruitment conducted by popular culture, most of the analysis will focus on the Clint Eastwood film, Heartbreak Ridge (hereafter HBR), which is unequivocally aimed at resurrecting a The Vietnam-damaged reputation of the armed services in general and the Marines in particular.

An emphasis on films should not be regarded as an abandonment of the historical in favor of the merely fictional, or a pursuit of the trivial rather than that which is central to history. What constitutes history for us in the media age is its representation in film. In effect, films "write history," as Anton Kaes has put it. "Along with professional historians and schools, the mass media have become the most effective and least acknowledged institutional vehicles for shaping historical consciousness."[31]

Kaes laments the vanishing of historical experience that such a mediation imples. "The past," he says, "is in danger of becoming a rapidly expanding collection of images."[32] But whatever the degradation of historical experience might be [perhaps it is just as degraded in cultures whose oral traditions or stories mediate its past], the "collection of images" is degraded history only if it makes the experience unservicable for those who consume them. With respect to the relevance here, it can be argued that those representations of Marine history, which foreground heroism and disguise the structural production of death, provide a degraded account of what constitutes the experience of being a Marine

because they allow insufficient access to what is at stake and why. Heroic Marine films constitute recruitment into a fantasy of male fulfillment rather than creating a frame for confronting life/death in a way that encourages political struggles over who should die, when, how, and why.

In any case, Heartbreak Ridge is a heroic story that focuses on the Grenada invasion, and its purpose may well have been the same resurrection mission as the invasion itself. A treatment of the Grenada invasion invites further comparision with Aztec warfare because it is similar in its seeming rationale to what the Aztecs designated as "flower wars." Aztec flower wars were distinguished from wars of territorial conquest, for their purpose was primarily one of demonstrating martial skills and serving the subsequent prestige structure. These were exercises aimed at obtaining honor rather territory, and although at times these wars developed into territorial wars, flower wars were also used to secure captives as well as supplying combat training.[33] In particular, the securing and sacrificing of captives and the role played by their sacrifice makes clear the ultimately inward, ontological aim of Aztec warfare. The comparison is apt, therefore, for the Marines, as noted above, are the most ontologically oriented military service, emphasizing, more than any of the others, the extent to which battle experiences perfect "men."

Marines in Films

There are many ways for us (i.e. the American political culture) to reexperience the Grenada invasion. As it will be reproduced here through a film reading, the suggestion is that we can better understand ourselves if we liken it to an Aztec flower war. However, Grenada for many, as it was produced in official discourse as well as popular culture, was experiened as the resurrection of American pride in general and of the Marine Corps in particular. HBR is a film that the American public had been long prepared to comprehend.

To supply a context for Clint Eastwood and his trainees' invasion of Grenada - the primary narrative of HBR - a brief consideration of an ealier heroic Marine film is essential. This is the John Wayne version in The Sands of Iwo Jima (hereafter SIJ), a thoroughly celebratory treatment of the Marine's role in World War II. Although it was released at a time when Marine prestige was very high, it was preoccupied nevertheless with the struggle between Marine training codes and the outer codes of the society as a whole, the theme dominating Marine films ever since.

There is a remarkable parallel between John Wayne in SIJ and Clint Eastwoood in HBR. Although on duty, they are dedicated, sober, and totally gung-ho Marines, off duty, both are drunk and disorderly. Morover, the cause of this conduct is the same in both cases. Both of them were unable to keep their marriages together because their wives would not tolerate either the separations from their husbands or their proximity; they disliked being left behind but also found it difficult to live with the fierce dedication of

gung-ho Marines. Thus the same theme discovered in the investigation of the Freikorps is apparent in both films: real men have no need for women, especially while involved in the manly pursuit of military violence. Moreover, dedication to codes that estrange the Marine from ordinary people is the more general point to be derived from these failed marriages, and it sets up the problematic of training, for aside from preparing bodies, what Sargeants Styker (Wayne in SIJ) and Highway (Eastwood in HBR) do is impose these codes on a variegated group of recruits who embrace social and cultural codes that are at best insensitive to Marine Corps codes and at worst anathema to them.

The representations of these diverse social and cultural codes in SIJ is crude and stereotypic by contemporary standards as is the representation of the Japanese adversary, usually referred to as "japs" or "nips" and once by Sargeant Stryker as "those little lemon yellow characters." What Stryker has to shape up are a variety of cultural attitudes, and behavioral codes that are imposed by the ethnic diversity of his unit. He must shape a single-minded unit out of people who are portrayed as crafty hustlers (represented by an Italian American) or mindless belligerents (represented by two Irish brothers who keep getting into fist fights).

Wayne/Stryker acts tough and excessively authoritarian but justifies his discipline by telling the men that unless they learn to think like Marines they will be dead. This has a parallel in HBR, in which Eastwood/Highway uses the same justification. There is of course a very different model of what produces dead Marines, namely going to war and being a high risk assault force, but the heroic Marine film seems to imply that lack of discipline is what kills, and this message is reinforced in SIJ in an episode in which a Marine stops for coffee before returning to his embattled foxhole mate with more ammunition, only to find his comrade killed. Sergeant Stryker admonishes and ultimately assaults him for having "doped off."

But ethnic diversity and the codes it enjoins is the least of John Wayne's (Sergeant Stryker's) obstacle to producing good Marines. One obstacle (also faced by Eastwood/ Gunnery Sargent Highway) is a rigid Marine command that tries to do everything by the book. And, as is the case with Highway in HBR, Stryker is threatened with Court Martial for his improvisational approach to training (e.g. a fist fight with one of his troops). The other, which provides most of the dramatic tension is the anti-military and anti-authoritarian civilian culture. One recruit, who is Stryker's toughest case, is the son of a former combat comrade who has been designated by his father as "too soft" to be a good Marine. The young man, Conway, represents himself as anti-disipline rather than soft and expresses disgust at the authoritarian violence of the Marine Corps. He remains resistant through most of the film to Strykers various uses of cultural codes to train and goad the men, many of them from western American culture (e.g. using the Mexican hat dance to train a clumsy recruit in bayonette fighting, and using the expression "saddle-up" every time the unit

as a whole has to move somewhere).

But Stryker's major adversary is a distrustful civilian culture, which he defeats in his struggle for the heart and mind of Conway. What is ultimately successful for Stryker is his own conduct. He serves as an effective role model. His heroic deeds on the battlefield change Conway's outlook. When Styker is killed in action, Conway takes over and uses Stryker's idiom, telling the men to "saddle-up" as he leads them off into the field.

Heartbreak Ridge repeats most of the cliches from The Sands of Iwo Jima, but is is shaped by the peculiar circumstances of the military in general and the Marine Corps in particular in the post-Vietnam War era. Its narrative structure and visual tropes are all mobilized to resurrect the honor of the Marine Corps, and to do so, it must create a gaping historical blindspot, the Vietnam War. The film begins with black and white footage from the Korean war and then jumps across Vietnam to a period just prior to the Marine invasion of Grenada. The hero Sargeant Gunney Highway (Clint Eastwood) has received a Congressional Medal of Honor for his service in Korea, and very little mention is made of Vietnam, except to note that he served there also.

The historical jump is visually marked. The black and white color at the outset constitutes a visual historical trope. Marines are shown marching behind a tank, and the troop passes a sign that says 38th Parallel, leaving no doubt that we are in Korean during the war in the early fifties. What is shown looks like actual footage from the war - mortars and heavy artillery being fired, at least one dead body lying in a street, and men in a deprived condition, e.g. stirring the broth that is cooking with their bayonettes.

The scene then cuts to the 1980's but stays in a black and white mode. Highway is in a jail cell where he is regailing his cellmates with war stories. A large man with a shaved head calls him a jarhead and tells him to pipe down, and after a warning, Highway beats him into submission and resumes his storytelling as the color comes in replacing the black and white.

In the next scene, Highway is before a judge being charged with drunk and disorderly conduct - fighting in a bar and urinating on a police vehicle. He is told by the judge that just because there is no war going on now does not give him the right to start one. Here the parallel with John Wayne is very close, for like Sargeant Stryker in SIJ, Sargeant Highway can only handle perpetual war; he cannot real life it when there is no combat.

Most significant for purposes at hand are the two kinds of struggles in which Highway is involved. One is a struggle against the Marine command hierarchy. He has been reprimanded, given trivial duties, and urged to retire because of his off-duty misdemeanors. When he reports for duty at a new post, an exemplary confrontation begins between Highway and his new commander who informs him, "this is the new Marine Corps," to which Highway responds, "I understand a lot of body bags get filled if I don't do my job." What we have here is the experienced veteran dedicated to combat duty and the bureaucrat, dedicated to the rules of the

command hierarchy.

The other exemplary confrontation is between Highway and a "black dude," rock and roll performer whom Highway meets before reporting to his new unit. We see the rock and roller (Mario Van Peebles) hustle Highway for a free lunch and take off with his gear as well as displaying arrogance, and rancor toward social proprieties. Van Peebles/Stitch is the Conway of HBR, for like the Conway with whom Stryker/Wayne is faced in SIJ, he is the hard nut to crack when Highway/Eastwood takes over his unit and is asked to make them combat-ready.

Here we witness the paradigmatic struggle against the general and popular culture, as Highway strives to implant unfamiliar codes of conduct. And, at the same time, we see him using aspects of the culture, particularly male culture, as a weapon. "I'll make them life takers and heartbreakers," he says. "Real men" (Marines) are not only killers but also sexual predators seems to be the implication. There are many references to Highway's notorious sexual appetite (of a piece with his appetite for violent confrontation), and in an early scene during the training period with his unit he tells them that he has "banged more quip and kicked more ass" than they could even imagine.

Throughout the film, women are the Other to be mastered, and Highway's third task (after opposing the hostile overly-rationalized Marine Hierarchy and opposing the cultural and social codes to win over the hearts and minds of his recruits) is to win back his wife. For this third task, he uses guile rather than bluster. Rather than opposing the cultural codes, he tries to adapt, and after being rebuffed in his first approaches at the bar where his ex-wife works, he is seen reading women's magazines, apparently concentrating on articles that use the popular couples psycho-babble about "meaningful relationships," etc. It would appear that his strategy is not coherent with his approaches in his other struggles, for he is clearly posing here, and his ex-wife's first reaction upon hearing this "relationship" talk is "what have you been reading?"

As it turns out, however, posing is part of the Highway's improvisational skill as a Marine. A good Marine is not one who blindly follows the rules but one who can improvise seems to be the imploication. Accordingly, during a crucial battle scene (mirroring an event during the actual Grenada invasion) when he and his unit are surrounded in a small building, Highway charges out into the open and then pretends to have been killed. Thereupon, his body serves as a marker to orient the rescue helicopter.

When he returns from the Grenada invasion, he is seen walking alone across the tarmac as various other Marine are warmly greeted by lovers and spouses, and just when it appears he will not be greeted, his ex wife is shown in the crowd, waiving a small American flag. She joins him, and as they walk off together, it is unclear whether it has been his improvising with the relationship codes that has won her back or his heroism, but it is clear that the two are connected. It may well be the latter, for just as the Grenada invasion has resurrected the Marine's credibility with an

admiring public, it seems to have restored Highway's with his ex wife. Thus the personal narrative of Highway winning back his wife mirrors the larger story of the Marine Corps winning back its public. And by implication, the Marines are cast as the manly saviors protecting a feminized society in need of the dsciplined violence of the "heartbreakers and life takers."

As important as Highway's winning back of his wife is, however, his more central battle is run parallel with the Marine's struggle to resurrect themselves in the public eye. That his most recalcitrant recruit, Stitch is a rock musician is appropriate, for rock music has always respresented the youth, counter-culture, despite the fact that it is also coopted/appropriated by economic and political structures of domination. For example, as early as the film, Blackboard Jungle (Richard Brooks, 1955) rock music "has been associated with more or less delinquent teenage subcultures,"[34] and here it is represented by Stitch. That Stitch is an African American simply enhances the struggle between the Marine codes and the centrifugal, counter-cultural codes against which Highway struggles in his training sessions.

The training period itself reevokes the Marine culture's impatience with simulation and longing for "the real." At one point Highway shocks both his own troops and the upper command by firing real bullets at their feet, and from time to time he fires an AK 47, "the preferred weapon on the enemy," to get "his men" familiar with the sound. Throughout training exercises, Highway violates the game and improvises to make the combat more realistic, always falling back on the idea that his men have to be prepared or they won't stay alive. He is constantly threatened with dismissal for this, as various rules are invoked, e.g. his carrying an "unauthorized weapon."

The value of the real is further invoked by the film story's valorization of the character of Eastwood, who like John Wayne in SIJ is a battle-hardened veteran, one who unlike the College, academy and bureacractically-minded Marines, has experienced the real of battle. While Highway violates Marines rules, he utilizes various masculinity codes to shape and goad the Marines recruits. He calls them "ladies," womanizes the idea of fashion and smashes fancy sunglasses, and makes them wear the same color shirts, crushing any signs of individualty, especially its expression through apparel. In addiiton, like Wayne, he uses his physical superiority to crush resistance, overpowering their strongest, mesomorph in the unit.

While the young men are still trying to resist, it is music again to which they turn; at one point they invent a rap song whose lyrics speak of what a dumb "jar head" Sargeant Highway is. When finally, the day of reckoning arrives and Highway leads his unit as an "advance group" in the invasion of Grenada, two levels are on trial in this representation of the invasion. The first is the Marine Corps itself, with its reputation tarnished by extention because of the post--Vietnam attitude to military adventurism and its functioning impaired by the displacement of combat veterans by academcy trained functionaries. The second is Sargeant Highway'

realistic, anti-simulation techniques of training and his drive to turn a culturally diverse group of young men whose consciousnesses have been colonized by popular culture into committed Marines.

Much of the early action during the invasion is ideological at a general level rather than decisive with respect to the romman d'education for Stitch and his peers. At one point, Highway finishes off a fallen enemy troop, firing at him at point blank range and then draws a cigar out of the dead man's breast pocket, sniffs it and pronounces it to be Cuban. During the rest of the action, this cigar protrudes from Highway's mouth like a large phallus, but apart from the manhood code that it this underlines, the episode stands as a legitimation of the invasion. Rather than an attack on a relatively defenseless Carribean nation, it is a confrontation with Cuba, a part of the enemy east-Bloc.

With the exception of the brief perilous period when Highway and company are pinned down by fire in a building, before the notorious helicopter rescue (obtained with a long distance call with a credit card back to a U.S. base), the rest of the operation is child's play. Gary Trudeau had it right when one of his characters in his "Doonesbury" cartoon referred to the Grenada invasion as a "special olympics" for the U.S. military.

What is decisive with respect to the film's resurrection narrative, is the cheering of the rescued medical students when the Marines break into their dormitory to free them - the nation needs them after all! - and a remark by Stitch on the tarmac after landing back on U.S. soil. He tells Highway that he has opted for being a Marine rather than a rock star. The Marine culture has triumphed over the divisive popular culture.

There is another important dimension to the film as a roman d'education. Not only are the enlisted men taught to be Marines through Highway's dedication and methods but also a wimpy, initially frearful ROTC officer learns to be tough. His training extends the film's roma d'education story. In addition the importance of a maleness is reinforced not only through the capitulation of Highway's ex wife to his heroism but also through the way that male bonding is figured. It is toughness not softness and caring that survives the adventure. When a worried Stitch bends over Highway after Highway has pretended to be dead to draw the copter with his body, Highway, feeling Stitch holding his hand, says, "just because we are holding hands doesn't mean we are going to be taking warm showers together in the wee hours of the morning. Again, ridicule of homoeroticism is employed to disparage anti hardened male values. In the last analysis, Heartbreak Ridge is a recruitment film par excellence, and it picks up what is novel in the television spot, for it adds to the code of toughness that of smartness. Eastwood's improvisational success adds craft to the simple sacrifice-your-body image that has long been a more or less singular attitude of the Marines.

Conclusion

The recruitment of today's Marine Corps continues with well-

targeted codes that offer the Marines as an avenue for "a few good men" to complete themselves as men. Given that this recruitment continues through the implicit attracctions in popular culture genres, one cannot ignore what is perhaps the most powerful of recent films, from the standpoint of cultural recruitment, A Few Good Men. This film, like other expressions of national sentiment - e.g. official political discourse - assumes that there is a crisis in the American political culture occasioned by the failure of the United States to obtain a clear victory in Vietnam. Of course this "crisis" stands as such, as Susan Jeffords has argued, only if certain masculinity stakes are foregrounded.[35]

In any case, Films and popular culture in general and the American political discourse at various levels have tried to reply to this "crisis." And there is good reason to believe that policy decisions have also constituted a reply. It is in the context of this reply that the more general recruitment of new Marines takes place. More specifically, the crisis has had to do among other things with the nation's inability to treat war deaths as heroic when war itself has become an illegitimate instrument of policy. This produces at once a glitch in the mourning of war dead, a disturbance in the national memory of its recent past, and a desire for those who seek to restablish the conditions of possibility of heroism to find new definitions and occasions.

In this context, the most recent feature film dealing with the U.S. Marine Corps has sought to broaden the idea of courage. Rob Reiner's A Few Good Men, like earlier Marine films, celebrates a version of masculinity and identifies the Marine Corps as an important site for its production. But the film seeks to pluralize the permissible models of heroism. Like Heartbreak Ridge, it is a recruitment film and is complicit with the post-Vietnam War remasculinization project. The project is of course conveyed by the title but most of the work is done through the misogynist treatment of Commander Galloway, (Demmy Moore) who fails to impress the Navy brass that she can handle the defense of two marines charged with murder at Guantanamo. That she is subsequently subjected to sexist disparagements by Colonel Jessup, the Commander of Guantanamo reflects negatively on a particular version of masculinity; it is part of the economy of character types that the film is sorting. Jessup is a flawed Marine whose values and models of appropriate Marine character are too narrow. But the goofy softball fanatic and Harvard trained lawyer, Caffrey (Tom Cruise) is portayed as exceeding Galloway's competence in practically all dimnesions. It is ultimately his heroism - taking risks in the courtroom - that reaffirms the masculine world of protection for which the Marines stand, and this bravery is shown to be edifying to the young accused Marines who had wrongly submitted their conduct to the narrow code of Jessup. You needn't be a stiff necked martinet to protect America's interests and maintain an atmosphere of justice and fairness within the warrior class. But whether Commander Galloway gets disparaged uncouthly by the martinet or simply cannot cut the mustard next to the brave young Navy lawyer, the message remains the same: manhood thrives by not needing women.

Heroism is a man's job.

Ultimately, the film also affirms a model of the world that requires heroism as well. Apart from the collection of Marine characters it portrays, some praise-worthy some terrible and some ambiguous, what the film consistently and umabiguously maintains is the peculiarity of the Marine base in Guantanamo Bay Cuba, its proximity to danger, to a "real" enemy. Much is made of the distance between bureacractic and combat positions in the Navy. Caffrey, the young, Harvard trained lawyer selected to defend the two Marines who have killed their unit mate, while trying to discipline him, is so unmilitary he cannot even intepret the 24 hour clock. His Washington venue, where he is shown playing softball, is contrasted with scenes of Guantanamo with its barbed wire enclosures, and most telling is the surprise Caffrey registers when told that to be safe, he had better wear camoflage over his dress white while at Guantanamo lest he be shot at from the other side of the fence, as an important military or political figure.

The acceptance of this model of danger is registered in Caffrey's defense of the failure of the young Marines charged with the killing to deviate from the code that had encouraged them to "discipline" their fellow trainee. Finally, we are shown a world that needs heroes (male heroes) and a menu of heroisms more inclusive than what was hitherto supplied by Sargent Strykers (John Waynes), Gunnery Sargent Highways (Clint Eastwoods) and Colonel Jessups (Jack Nicholsons).

A CONTINGENCY PERSPECTIVE ON ISSUE SALIENCE AND POLICY DEVELOPMENT

Elaine B. Sharp
University of Kansas

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

INTRODUCTION

Although the importance of public opinion in a democratic polity is assumed, there have been dramatically different perspectives on the role that public opinion actually plays in the policymaking process. At least three views can be identified. One, which is consistent with Cobb, Ross, and Ross's (1976) "outside initiative" model of agenda setting and with what Baumgartner and Jones (1993: 88) call a Downsian model of issue expansion, emphasizes the way in which changes in popular mood, brought about by either the triggering effect of important events or long-term secular trends, serve to put pressure on government for policy responses to perceived problems (Kingdon, 1984; Page and Shapiro, 1992). A second perspective emphasizes the way in which both mass opinion and political participation are strategically structured out of the policymaking process, such that policymaking is insulated from popular input. This perspective, which emphasizes the demobilization of public attention, parallels Cobb, Ross, and Ross's (1976) "inside access" model of agenda setting and is reflected in studies of subgovernment politics, nondecisionmaking, and the like. A third perspective, like the second, hinges on elites strategically manipulating public opinion for the sake of their own policy goals. From this perspective, however, interest focuses on those occasions when elites attempt to activate mass opinion and mobilize the public around an issue (Rosenstone and Hansen, 1993). This third perspective fits Cobb, Ross, and Ross's "mobilization" model of agenda setting and is reflected in the work of scholars who argue for the treatment of public opinion as a dependent variable (Margolis and Mauser, 1989).

But under what circumstances should we expect to observe one rather than the other of these patterns of linkage between public opinion and policymaking? This is, in a sense, a question very much in the tradition of Schattschneider (1960), because it essentially asks the conditions under which there will be an expansion in the scope of conflict. Schattschneider's thesis is that, in general, those on the losing side in a conflict will be most interested in expanding it (i.e., mobilization of public opinion); privileged interests are presumably typically interested in containing conflict within their sphere of influence (i.e., inside access). Major social problems that precipitate government action in response to popular concern (outside initiative) are presumably the most destabilizing of situations, because the scope of the conflict is quite broad and relatively unmanaged.

Unfortunately, there has not been clear cut progress in further elaborating on these basic insights. To the extent that it deals with public opinion and policy formation, research on public opinion has tended to focus on the congruence between citizens' policy preferences and government policy (Page and Shapiro, 1992), without necessarily elaborating upon the mechanisms behind such congruence. Perhaps the major exception is that research which shows the special constraints upon some would-be mobilizers of public opinion, specifically, the finding that the public either ignores or is negatively influenced by groups that are seen as narrowly self-

interested while public opinion is more responsive to other kinds of groups or leaders (Page, Shapiro, and Dempsey, 1987). Generally, public opinion scholars have been more attentive to trends in the substantive direction of public opinion on various issues than to the differential salience of issues over time and the reasons for shifts in issue salience. Yet, if our concern is with whether public opinion drives policymaking, is driven by policy makers, or is neutralized for strategic purposes, the matter of which issues are salient is as important as the direction of the public's thinking on a given issue.

Recent research on policy dynamics has offered some important insights on the role of public opinion, especially concerning the way in which the tone of popular attention to an issue affects policy change (Baumgartner and Jones, 1993). But that research is not directly aimed at accounting for differing issue expansion scenarios, and despite empirical attention to different areas of policy, it does not explicitly adopt a theoretical stance that makes the role of public opinion contingent upon the type of policy issue at stake. Yet there is a long research tradition which suggests that the character of policy conflict and incentives for conflict expansion are contingent upon the type of public policy (Lowi, 1964; Wilson, 1980). This paper builds upon this tradition, elaborating a set of hypotheses about the role of public opinion in various types of public policy situations and exploring the potential utility of the hypotheses through preliminary, comparative case analysis.

Hypotheses

Although Lowi's typology might be equally useful, this paper uses Wilson's (1980; 1989) typology as the basis for hypothesis development because, by specifying issue stakes and the typical interrelationships among organized interests and governmental actors in four policy situations, it offers important cues for deductions about whether or not conditions are ripe for efforts at issue expansion. Wilson's typology, replicated in Figure 1, stipulates first a situation in which a dominant interest group enjoys concentrated benefits while costs are broadly borne -- a situation that, Wilson argues, typically places government agencies in a position of fostering the dominant interest. This is the situation of **client politics**, a profile familiar to students of iron triangles and subgovernments. Second is the case of **interest group politics**, where two or more organized interests have conflicting stakes, such that both the benefits and the costs of governmental action are concentrated. In situations in which the costs of a proposed policy would fall heavily on a dominant interest while the benefits are broadly available, government officials are cast in the role of playing **entrepreneurial politics** in order to overcome the inertia of the vested interest. Finally, on issues that seem to generate neither concentrated costs or benefits for any organized interest, there is **majoritarian politics**, in which politicians attempt to "capitalize on inflamed public sentiment" (Wilson, 1989: 78) about some problem but in ways that are not perceived as threatening to any particular organized interest.

It can readily be hypothesized that episodes involving entrepreneurial politics are ripe for efforts at issue expansion along the lines of the mobilization model. Indeed, Wilson suggests that this will be the case, because the powerful group that would have costs imposed on it will organize in opposition while diffuse, unorganized beneficiaries have no incentive to push for the policy at issue. Hence, a policy entrepreneur must awaken the silent beneficiaries and overcome the intensely organized opposition by turning the conflict into something like a moral crusade (Wilson, 1989: 77). In this case, public sentiments lie dormant unless and until policy entrepreneurs activate them. Hence, the following hypothesis:

H1: In cases of entrepreneurial politics, issue salience among the mass public will be low prior to the episode and heightened as part of the episode.

Majoritarian politics also involves heightened public concern. But, as Wilson's example of the Sherman Anti-Trust Act suggests, politicians in this situation are responding to inflamed popular sentiment rather than stoking it themselves. Majoritarian politics thus implies something like the "outside initiative" model of agenda setting:

H2: In cases of majoritarian politics, issue salience among the mass public will be high prior to the initiation of the issue on the government agenda.

In cases of client politics, efforts at issue expansion and activation of the mass public are least to be expected. Since costs are diffuse, those bearing them have no incentive to organize and may have little awareness of the issue; meanwhile, the narrow interest that captures the benefits has every incentive to avoid calling attention to the situation. And those with access to policy developments have no incentive to arouse controversy. Something like the "inside access" model of agenda-setting is to be expected:

H3: In cases of client politics, issue salience will be low prior to governmental attention to the issue and will not be invoked by governmental attention to the issue.

The most complex expectations with regard to issue expansion involve interest group politics. Schattschneider suggests that those losing a conflict attempt issue expansion. Hence, episodes of interest group politics might be expected to invariably involve escalating issue salience as one side or the other appeals to the public, unless, in the manner of niche politics (Browne, 1990), the issue is framed such that different interests do not confront each other. But, as the work of Page, Shapiro, and Dempsey (1987) suggests, expansion of the scope of the controversy will not be advantageous to a group if its' position on the issue is unlikely to be favored by the mass public or if the group itself is likely to function as a negative cue giver (Kolman, 1992). Hence, a more sophisticated hypothesis would posit that issue expansion in cases of interest group politics is contingent upon the direction of

public opinion vis a vis the contending groups:

H4: Interest group politics will generally tend to heighten issue salience since there will typically be a threatened interest with the motivation at issue expansion. However, whether interest group politics involves efforts at issue expansion is contingent upon the pattern of prevailing character of public opinion.

Methods

Definitive tests of these hypotheses would require examination of a substantial number of cases of each type, and, for the situation of interest group politics, cases showing variation with respect to the prevailing character of public opinion. Whether amassed through original case studies or meta-case analysis, such hypothesis-testing constitutes a substantial enterprise. This paper does not offer the results of such an enterprise. Rather, the paper draws upon a more modest but varied set of case studies which serve as "plausibility probes" which can be used to assess whether the hypotheses developed above show enough preliminary empirical support to warrant large-scale, rigorous testing (Eckstein, 1992: 147-8; George, 1979: 52).

Although the term "case study" is often used to refer to a description of the entire history of a developing policy area, for this analysis a case is a specific episode of policymaking on a particular issue. Tracing a given issue over time, one finds that its place in the Wilson typology may change several times, as policy proposals and associated perceptions of costs and benefits change, and as the number and character of organized interests in the policy domain change. Any given policy history thus generates several different cases for analysis.

This paper draws cases from the history of policy concerning rights for the disabled and from the history of controversy over regulation of fetal research. These policy areas were chosen because both are forms of social regulatory policy (Tatalovich and Dayne, 1988) and both witnessed important contemporary developments during the Bush administration which grew out of a series of earlier policymaking episodes extending back roughly 20 years. In addition, the policy areas offer a potentially important contrast with respect to patterns of public opinion, a matter of importance for the proposed hypothesis concerning interest group politics. Cases drawn from the history of fetal research regulation illustrate policymaking in the context of the enormous divisions of public opinion concerning abortion, while the cases drawn from the history of disability rights illustrate policymaking on a topic that has no such heated divisions of public opinion.

Drawing upon existing studies of disability rights policymaking (Scotch, 1984; Percy, 1989) and fetal research regulation (Maynard-Moody, 1992) supplemented by evidence from other secondary sources, the first portion of the analysis uses meta-case analysis to classify each of ten policymaking cases in one of the categories of

Wilson's typology. Several sources of information provide evidence about the extent and timing of issue expansion concerning disability rights and fetal research: the yearly counts of Reader's Guide to Periodical Literature articles on each topic serve as indicators of the salience of the issue to the mass public[1] and the published studies, coupled with other secondary sources and information from journalistic accounts and Congressional hearings provide information about actual or threatened protest activities and other efforts to expand or restrict the visibility of the issue.

DISABILITY RIGHTS: POLITICS OVER A VALENCE ISSUE

The Americans with Disabilities Act: Interest Group Politics. On July 27, 1990, President Bush signed into law the Americans with Disabilities Act, a major civil rights bill that bars discrimination on the basis of handicap in private sector employment, public services, and public accommodations. The policymaking process leading to the passage of ADA was, in many ways, the epitome of interest group politics. Proponents of the measure included a wide array of disabled groups, spearheaded by the National Council on the Handicapped (NCH), a commission created during the presidency of Ronald Reagan, as well as the 185 organizations that are part of the Leadership Conference on Civil Rights. In addition, a number of health and social service organizations lined up behind ADA because its definition of the disabled and the rights to which they are entitled would yield the kind of protection from discrimination for individuals with AIDS for which those organizations had been pressing (Rovner, 1989: 1121). Arrayed against these proponents of ADA were various business interests concerned about the costs of compliance, especially for small businesses. A spokesperson for the U.S. Chamber of Commerce, for example, argued that the costs of complying "would be enormous and obviously could have a disastrous impact upon many small businesses struggling to survive"; similar arguments were made by the National Federation of Independent Business, the primary association for small businesses (Rovner, 1989: 1122).

This clash of organized interests, one side facing concentrated costs and the other facing concentrated benefits over the proposed legislation, is clearly a case of interest group politics. However, the development of comprehensive civil rights for the disabled is a policymaking process that extended over twenty years, encompassing several distinctive episodes, not all of which involve interest group politics.

Legislating Section 504: Majoritarian Politics. The initial episode of policymaking concerning rights for the disabled involves the enactment of Section 504 of the Rehabilitation Act of 1973, which bars discrimination against the handicapped in federally assisted programs. This legislative basis for disability rights came about in an extremely low-key, behind-the scenes fashion, at the initiative of Congressional staff who added a provision with disability rights language to the Rehabilitation Act of 1973, a renewal of the vocational rehabilitation program. According to Scotch's (1984) detailed case study, the legislation did not

initially include such language, nor was a disability rights provision discussed at any of the hearings held on the Rehabilitation Act. "Rather, the section was conceived by Senate Committee staff members and added to the bill at a relatively late point in the legislative process" primarily as a form of liberal challenge, because Congress at this time was locked in institutional and partisan conflict with the president (Scotch, 1984: 46-9). "Section 504 was not developed at the urging of representatives of disabled people...it was an initiative of liberal congressional staff and not done at the request, suggestion, or demand of outside groups" (p. 57). Indeed, in this period, organized interests representing the disabled were fragmented across an array of specific disabilities, were just becoming politicized, and had not yet defined civil rights for the disabled as a goal (p. 57).

Consistent with Wilson's definition of majoritarian politics, both perceived costs and benefits of Section 504 were diffuse at the time of enactment. Although costs would become an issue later, Scotch finds that the legislative history of this provision "contains only passing references to Section 504" and that there is no statement "providing any rationale or predicting any impact...it appears that most members of Congress either were unaware that Section 504 was included in the act or saw the section as little more than a platitude, a statement of a desired goal with little potential for causing institutional change" (pp. 53-4). In one sense, the beneficiary group for disability rights is a relatively narrow group; but, because this group was neither organized to pursue such rights nor aware of Section 504, benefits may be said to be diffuse as well. Section 504 was not a specific package of benefits of concentrated interest to an organized interest; it was enacted as a form of low level symbolic politics, i.e., as a gesture of liberalism.

Initial Rulemaking for Section 504: Entrepreneurial Politics. HEW Secretary Weinberger gave responsibility for administering Sec. 504 to the Office of Civil Rights within HEW in the fall of 1973. This assignment placed Sec. 504's interpretation in the hands of an organization that had spent all of its history in the vanguard of efforts to fight racial discrimination "often in the face of opposition by uncooperative or hostile public officials and community leaders" (p. 63). Rather than seeing universities, local governments, and other federal fund recipients as its client organizations, OCR viewed them as highly organized adversarial groups, and was intensely aware of the concentrated costs that such organized interests would perceive when confronted with aggressive provisions to accommodate the disabled. And OCR's interpretation of Sec. 504 was one that would impose concentrated costs upon such organized interests. For example, draft regulations stipulated that there was a need for special accommodations; and unlike earlier initiatives that mandated the removal of architectural barriers only in new construction, the regulations held that barrier removal must be effected in existing buildings as well.

Costs were thus made concentrated by rulemaking interpretations that converted a seemingly innocuous legislative provision into a

substantial mandate for federal fund recipients. On the other hand, benefits remained diffuse at this time, as organizations representing the handicapped remained largely unaware of Sec. 504 and OCR staffers proceeded on the basis of generalized beliefs about civil rights. There were some informal contacts with disabled individuals, though not disabled organizations, as OCR staff attempted to learn how general civil rights issues applied in the case of the disabled. Through those informal contacts "gradually, informally, the word got out to disability advocates that Section 504 existed and that it was important. Formal involvement by organized groups did not take place until the proposed regulation had already been drafted, in part because of the limited organizational capacities of most disability organizations" (p. 79-80). Thus, between the enactment of Sec. 504 in 1973 and the completion of the first full draft regulations in April, 1975, OCR played the game of entrepreneurial politics, taking aggressive action that threatened concentrated costs for powerfully organized, federal fund recipient groups even while the benefits of Sec. 504 remained diffuse from the perspective of disability groups.

Further Rulemaking and the Emergence of Interest Group Politics. David Mathews replaced Casper Weinberger as Secretary of HEW in the summer of 1975, just when approval from the HEW Secretary was needed to publish the newly completed draft regulations for Sec. 504. Mathews had many reservations about the draft produced by OCR, because the approach seemed too controversial. So he delayed the publication while insisting on a more elaborate inflation impact statement; and, although that assessment yielded a positive cost-benefit analysis in March, 1976, Mathews stalled still further on publishing the regulations (p. 88).

These delays would not go unchallenged for long, because disability groups, which had heretofore been unaware of Sec. 504 and largely inert politically, had become activated by late 1975. In that year, 19 organizations representing different disabled groups joined a fledgling umbrella group, the American Coalition of Citizens with Disabilities (ACCD), which had been formed by two disability rights activists the previous year at the meeting of the President's Committee on Employment of the Handicapped (p. 83). Meanwhile, the staff at OCR had increased their contacts with disability rights advocates, thus providing a pipeline of information about the potential of Sec. 504 and the status of the stalled regulation. By 1976, "...several disability organizations, particularly ACCD, were lobbying Congress and the executive branch about their concerns...These contacts culminated in a demonstration by a number of disabled leaders in David Mathews' office in the spring of 1976 (pp. 92-3).

The draft regulations were finally published in May, 1976. In response, "OCR received over three hundred written comments...from both disability rights advocates and from recipients of federal funds" (p. 94). Advocates not only pressed for the acceptance of the regulation but objected to any consideration of costs and any long periods for institutions to come into compliance; federal funding recipients like higher education were raising concerns about

costs and asking about lengthened periods for compliance and waivers. By the end of a second, extended comment period (October, 1976), OCR had received more than 850 written comments" (pp. 94 and 102). ACCD, the American Council for the Blind, and the Children's Defense Fund were now activated on behalf of the draft Sec. 504 regulations, while organizations such as the National Association of State Universities and Land-Grant colleges, the American Council on Education, the National League of Cities, the National Governor's Conference, the American Hospital Association, and numerous other recipients of federal funds were activated around concerns about the Sec. 504 regulations.

The response of HEW Sec. Mathews was again delay; and Sec. Califano, his replacement in the new Carter administration, was also inclined to go slow because he "saw the regulation as a reflection of the demands of the disabled groups without appreciation of the political and financial implications" (p. 105). Califano created a task force to review the proposed regulation -- a task force that met in 1977 with more than 45 "organizations representing disabled people" along with "a somewhat smaller number of recipients [of federal funding]" (p. 108).

In response to this delay, ACCD decided upon a dramatic gesture in order to put pressure on Secretary Califano. An ultimatum was sent to President Carter, indicating that if Califano had not signed the regulation by April 4 they would hold protests in every HEW regional office in the country as well as at HEW headquarters in Washington, DC. When Califano indicated at an April 4 meeting that he would not immediately sign the regulation, disability rights groups walked out of the meeting and 300 disabled people "staged a sit-in in Califano's office in Washington, while demonstrations were held in each of the ten HEW regional offices..." (pp. 111-1133). On April 28, 1977, the draft regulation was signed, without any modifications to dilute the aggressive interpretation of Sec. 504 that had been staked out initially by OCR.

Sec. 504 Rulemaking in Other Agencies: The Continuation of Interest Group Politics, 1977-1986. Although disability rights groups could feel that they had won an important battle when HEW signed off on OCR's Sec. 504 regulations, the rulemaking process for Sec. 504 was extended still further as other agencies developed regulations to implement Sec. 504 along the lines laid down by HEW. As this process extended into the Reagan administration, the clear victory that disability rights advocates had achieved was eroded by reversals.

Perhaps the most difficult of these followup processes was in the Department of Transportation where rulemaking for Sec. 504 began in 1978 and extended until 1986. These 8 years of transit-related controversy began with DOT issuing regulations calling for full accessibility to the disabled of all components of the nation's public transit systems. Despite outcry from organizations such as the American Public Transit Association (APTA) about costs and about the unreliability of technology for handicapped access, such as lift-equipped buses, DOT held to its initial stance in final

regulations issued in May 1979, although it extended to ten years (from six) the time that transit authorities would have to make at least half of their fleet accessible (Percy, 1989: 137-140).

"Controversy about full-accessibility objectives in public transportation did not end with the issuance of DOT's final rules; instead, it intensified..." -- disabled groups pressed Congress for further attention to physical barriers, government leaders "used the media to complain about the compliance costs..." and APTA attempted to overturn the regulations in court (*APTA v. Lewis*) (pp. 141-144). In response, in 1980 Congress attempted to legislate a compromise that would "limit the impact of the DOT regulations"; the process, featuring negotiations "with key interest groups, including APTA, Paralyzed Veterans of America, the American Coalition of Citizens with Disabilities (ACCD), DOT, and CBO" failed, as Congress never passed the mass transportation act that would have contained the compromise (pp. 144-5).

DOT's full accessibility regulations were doomed, however. DOT was swamped with a flood of requests for waivers, the newly installed Reagan administration was committed to deregulation, and, in 1981, "the U.S. Court of Appeals for the District of Columbia overturned a lower court decision in the *APTA v. Lewis* case and ruled that the full-accessibility regulations exceeded statutory intent as spelled out in section 504" (p. 146). In August, 1981, the Department of Justice (which had replaced HEW as the coordinating agency for Sec. 504 regulations), suspended the guidelines for mass transportation.

DOT then issued another set of proposed rules which would have allowed for "local flexibility in determining how to make transportation systems usable by the physically handicapped" and mandated only "special efforts" rather than full accessibility. In response to these proposed rules, disability groups offered negative comments and reports suggesting that local flexibility often translated into lower quality services for the disabled (pp. 146-7). In response to this rulemaking stalemate, Congress enacted an amendment to the Surface Transportation Assistance Act of 1982 "requiring the secretary of transportation to establish minimum service criteria for transit authorities to follow in designing services for elderly and handicapped citizens" (p. 148).

DOT's proposed rules to implement this amendment set minimum criteria such as service availability in the same geographic areas and at the same times as for the general public, along with a proposed cost cap. The response to these proposed rules was the same flood of comments from interest groups in 1983 that had greeted earlier rulemaking phases, "with the transit industry arguing that the rules were too stringent and would impose substantial costs" and disabled groups pressing for stringent rules and opposing a cost cap (pp. 149-150). Further review based on these comments plus approvals by OMB and DOJ extended the rulemaking process another three years, before final rules, largely the same as the proposed ones, were issued in 1986.

EVIDENCE OF ISSUE EXPANSION IN THE DISABILITY RIGHTS CASES

In contrast with the fetal research cases that follow, public opinion relevant to these disability rights cases is far from divided. While the concerns of the disabled may not be a burning issue for most Americans, there is evidence that, in the wake of the civil rights movement, Americans became more predisposed to civil rights in general and overwhelmingly in favor of rights for the handicapped. In Harris surveys in 1978 and 1982, for example, over 90% of respondents were in favor of "affirmative action" programs for the physically handicapped, a higher proportion than those favoring such programs for women, blacks, or any other group (Page and Shapiro, 1992: 97-8). In 1989, the public remained extremely receptive to disabled civil rights. A Gallup Poll in December, 1989 found 81% responding that there was "not enough" attention to the civil rights of the disabled. Only the elderly (at 84%) elicited a similar magnitude of favorable response; about half or fewer of respondents perceived "not enough" attention to the civil rights of groups such as women, blacks, and people with AIDS (Colasanto, 1989: 15). Under these circumstances, expansion of the scope of conflict in the hypothesized situations might be expected from disabled groups, especially when their cause appears to be losing; but organized interests opposing them would surely be constrained from issue expansion. Or would they?

The available evidence on mobilization of public opinion in the five cases of disability rights policymaking suggests that (a) majoritarian politics was a response to high issue salience among the mass public, but only in a special sense; that (b) entrepreneurial politics was probably not associated with heightening of issue salience, as has been hypothesized, but that (c) interest group politics <u>is</u> typically conducive to mobilization of the mass public, as hypothesized. Furthermore, there is evidence in these cases that expansion of the scope of conflict in situations of interest group politics is not necessarily instigated by those who are in danger of losing a policy battle, but is most strongly instigated by those whose position is most likely to be conducive to the prevailing direction of public opinion.

Figure 2, for example, shows that in the initial episode of the disability rights policy history, disability rights was a nonexistent issue to the mass public prior to and during this episode. Nor is there any case evidence of attempts to mobilize attentive or mass publics around the issue of civil rights for the handicapped prior to or during this episode of majoritarian politics. Rather, the legislative history shows Sec. 504 as being virtually invisible even to members of Congress who were enacting the Rehabilitation Act to which it was attached. There was, however, substantial public interest in the disabled generally at this time. Scotch (1984: 34-5) argues that this was due to a dramatic increase in the number of disabled individuals as a result of medical developments that saved those with injuries and extended the life span of those with other medical problems and the influx of Vietnam veterans with disabilities. Consistent

with this argument, the number of popular articles on the disabled, although small by comparison with later years, was substantial before and during this first episode (see Figure 2). Furthermore, this was a time in which "civil rights" was generally an idea in good currency, and the key staffers who inserted Sec. 504 into the Rehabilitation Act had experience with prior civil rights legislation (p. 52). In short, this case is not consistent with expectations about majoritarian politics if that hypothesis is narrowly interpreted to require response to elevated popular concern about a specific issue. It is, however, a case in which low-level decisionmakers took action consistent with generalized public interest in the disabled and consistent with sweeping trends in the civil rights area.

Entrepreneurial politics has been hypothesized to involve attempts to mobilize public opinion concerning an issue. Figure 2 shows that, while popular interest in disability rights remained low during the brief episode of entrepreneurial politics, there was a surge in issue salience immediately after. This might be considered consistent with the hypothesis for entrepreneurial politics. But the evidence is ambiguous, because the followup surge in issue salience occurred during a period of interest group politics, and it has been hypothesized that surges in issue salience will tend to occur during episodes of interest group politics. In short, when a case of interest group politics follows immediately on the heels of entrepreneurial politics, as it does here, the relevance of the evidence for one versus the other case is unclear. Furthermore, the case study provides no evidence of attempts to mobilize attentive or mass publics. In fact, in this period, the OCR was, according to Scotch, limiting its contact with groups outside of HEW. Despite the fact that it was aware of the hostile reaction that its interpretation of Sec. 504 would eventually generate among federal fund recipients, OCR kept the development of its draft regulations very low-key, consulting for informational purposes with some disabled persons, but showing no signs of mobilizing disabled groups to raise public awareness of the need for civil rights for the disabled (Scotch, 1984: 79-80). And because both disability rights groups and federal fund recipients were almost completely unaware of Sec. 504 until the draft regulations were completed, neither was in a position to mobilize public opinion about the issue at this time.

There is substantial evidence of escalating issue salience and direct efforts to mobilize public opinion during all three episodes of interest group politics, however. Figure 2 shows a surge in attention to disabled civil rights in the initial years of conflict over Sec. 504 rulemaking. And the case study offers strong evidence of attempts at issue expansion by disability rights activists, who twice engaged in demonstrations designed to mobilize popular attention to their cause. The potential impact on public opinion of demonstrations in this case was well understood by activists, who "hoped that the sight of demonstrators in wheelchairs and with seeing-eye dogs would evoke public sympathy and force Califano to act" (Scotch, 1984: 112). The second phase of interest group politics is linked with very high levels of issue salience con-

cerning the disabled generally and heightened but oscillating public attention to disability rights in particular, as Sec. 504's implementation beyond HEW wound its way through various agency rulemaking processes, Congressional mobilization over the rules, and a court suit. In place of the street demonstrations characterizing the earlier phase, attempts at issue expansion at this time included lobbying efforts, a court suit, and heavy use of the media by local government officials. The third phase of interest group politics, leading to the passage of ADA, is linked to a sharp upsurge in the salience of disability rights (see Figure 2) and a return to protest activity as a tactic for mobilizing public opinion. Once again, disability rights activists made use of the particularly potent symbolism of demonstrations by the disabled:

> The pictures were striking, just as they were intended to be: children paralyzed from the waist down crawling up the steps of the Capital, and more than 100 protesters, most in wheelchairs, being arrested by police officers in riot gear after raucous demonstrations in the Rotunda (Holmes, 1990: 5).

FETAL RESEARCH: POLITICS IN THE CONTEXT OF DIVIDED OPINION

The second set of cases for this paper stem from several periods of controversy over fetal research -- a highly technical subject that nevertheless touches on the moral sentiments of the public in potentially explosive ways. The linkage of fetal research to the abortion issue helped to propel the otherwise technical issues of biomedical funding and research protocols onto the broader public agenda, despite the clear preference of the scientific community that science not be governed by public passions and the politics of morality (Maynard-Moody, 1992, 4).

Episode #1: Client Politics. Fetal research includes studies, many using autopsies of dead fetuses, designed to diagnose and cure birth deformities, pharmacological studies of the effects of alcohol, medicines, and other substances on fetuses, research on "nonviable fetuses," and, most recently, research on the transplantation of tissue from fetuses to other patients for purposes of curing Parkinson's, Alzheimer's, and other diseases. All of these forms of fetal research have yielded dramatic medical advances and the potential for still more medical benefits. However, the research also entails practices and procedures that raise ethical issues, such as the appropriate handling of nonviable fetuses or the arrangements surrounding the obtaining of tissue from aborted fetuses (Maynard-Moody, 1992: 5-6). In Great Britain, concerns about the ethics of fetal research had led to the creation in the early 1970's of a Parliamentary commission, the Peel Commission, which, in a 1972 report, suggested a number of guidelines to provide protections for fetuses as human subjects in research (p. 11).

The scientific research community that would confront this issue in the United States had been a privileged client of government since World War II. In the 1950's, physical scientists

played important roles in nuclear research and led the way in the organization of a science policy subgovernment (Dickson, 1984: 28). By 1968, Don Price could characterize science as "the major Establishment in the American political system: the only set of institutions for which tax funds are appropriated almost on faith, and under concordats which protect the autonomy, if not the cloistered calm, of the laboratory" (1968: 71). In the late 1960's and early 1970's, the domination of science policy by "scientific, military, and corporate elites" was challenged by groups trying to champion democratic values and the scientific establishment ran afoul of the Nixon administration as well, allegedly as a result of personal antagonisms (Dickson, 1984: 18; 30-31).[2] Despite these developments, it is appropriate to view institutional science, and especially biomedical science, as constituting a potent subgovernment. Adverse developments like those in the Nixon administration had short-term effects primarily on funding of basic physical science and arrangements for science policy advising. In the biomedical sciences, there are strong linkages between institutionalized biomedical research in universities and medical schools and the National Institutes of Health, which provides most of the research funding for those institutions (Dickson, 1984: 21).

With respect to the question of the propriety of fetal research, then, the biomedical science establishment constitutes a dominant interest group, which had stakes in protecting two types of concentrated benefits: autonomy of the scientific enterprise from popular control and continuity of research funding (Miller, 1983: 4). Any hint that fetal research might get caught up in politically-inspired regulations would be viewed as threatening to the scientific community (Maynard-Moody, 1992: 4).

Not surprisingly, NIH initially attempted to deal with the kinds of concerns that led to the Peel Commission in Great Britain by attempting to develop internal guidelines that "might head off controversy at home." Draft guidelines were being "quietly debated" by NIH, and would have remained quiet were it not for the Washington Post picking up on a story on the guidelines in a medical newsletter and, on April 10, 1973, publishing a story on fetal research and the proposed guidelines (Maynard-Moody, 1992: 11). Because the Court's decision in *Roe v Wade* had just been handed down three months earlier, the Washington Post reporters and editors were presumably interested in the story because of its potential interest value in a time of heightened controversy about abortion. "Despite the tentative status of the guidelines, the story ignited some public reactions. The Post's disclosures brought national news coverage, clarifications and denials by NIH officials, and a street demonstration at the NIH offices, calling for a total ban on fetal research" (p. 11). This public controversy was small-scale and short-lived. The street demonstration, for example, consisted of a handful of school children from the Stone Ridge Country Day School of the Sacred Heart, a Catholic school located next to NIH headquarters. The school children informed NIH that they wanted to picket to protest against any research on live fetuses and NIH, in response, organized a special meeting in the NIH auditorium to discuss the matter (Schmeck, 1973: 30). Nevertheless, this initial controversy

effectively forged a link between fetal research and the abortion issue (Maynard-Moody, 1992: 12). Despite the minuscule nature of the demonstration, but perhaps because of the potency of the abortion issue to which fetal research was now attached, NIH officials promised demonstrators that they would not support research on living fetuses (Culliton, 1975: 811).

Episode #2: Entrepreneurial Politics Surrounding the National Research Act of 1974. There was, in 1974, no organized set of interests to mobilize and counter the power of the biomedical science subgovernment. Anti-abortion activists had just been awakened by the unexpected ruling in Roe v. Wade (Faux, 1990: 5-6) and were far from the highly mobilized status that they would later achieve. However, the fledgling anti-abortion movement could take heart in the fact that ethical issues involving biomedical research, especially that on fetuses, did have a number of policy entrepreneurs strategically located and willing to act in a way that placed the biomedical science community on the defensive. Two of these entrepreneurs, Senators Edward M. Kennedy and James L. Buckley, were instrumental in instituting a temporary ban on fetal research and creating review bodies charged with monitoring ethical issues in biomedical research. These mandates were incorporated in the National Research Act of 1974, a piece of legislation that constrained the autonomy of science in ways that offended, annoyed, or threatened many in the scientific community. The status quo had abruptly shifted from one in which the scientific community was a privileged client, favorable to its government sponsors, to one in which the scientific community was hostile to governmental goals.

The National Research Act of 1974 was initially introduced in the House as a proposal to provide for NIH training grants and contained only a minor reference to research ethics. In the Senate, Kennedy had introduced a unrelated bill focusing on ethics in human experimentation. "Using the House bill's paragraph on ethics as the necessary technical hook for joining two bills, Kennedy's staff tacked his human experimentation bill onto the training bill that came over from the House." Kennedy's version mandated the creation of a National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, charged with codifying ethical principles for clinical research, creating review boards in all institutions engaging in research on humans, and analyzing the "ethical, social, and legal effects of advances in biomedical and behavioral sciences." Senator James Buckley then introduced an amendment banning all fetal research, an amendment that Kennedy supported once it was modified to be only a temporary ban covering the period in which the commission deliberated on the fetal research issue (Culliton, 1974: 426-427). A conference committee compromise yielded a temporary, 2-year commission, to be followed by a permanent council which would come into existence at the expiration of the commission's term. The legislation mandated that the Secretary of HEW make public in the Federal Register any commission recommendations, his response to the recommendations and his reasons if any recommendation were to be rejected. The commission was specifically mandated to first tackle the matter of the ethics of fetal research. The National Research Act, encompassing all these provi-

sions, was signed into law by President Nixon in July of 1974 (Culliton, 1974: 427).

The commission generated recommendations that were viewed as reasonable and moderate, even within the scientific community. These included a recommendation that permitting research on fetuses that are to be aborted if the research itself presents no risk to the fetus. Research that would be too risky to perform on a viable fetus could still be conducted on a fetus that was about to be aborted providing that the research were approved by a national review panel and by the Secretary of HEW (Culliton, 1975: 811-813). While the commission was deliberating, HEW continued its efforts to develop guidelines, a process that generated over 450 public comments directed at HEW, primarily by scientific organizations. The final draft of HEW's guidelines, which corresponded almost completely with the commission's recommendations, were approved in July of 1975, and became "the regulations governing all fetal research funded by the federal government" (Maynard-Moody, 1992: 16). With mechanisms in place for fetal research proposals to be reviewed and funded, the scientific community had weathered the initial storm of this controversy, and could proceed with only limited restrictions on its autonomy.

Episode #3: Client Politics Revisited. "From the approval of these regulations until the fall of 1982, the controversy quieted down" and fetal research continued, largely "undisrupted by the more cautious oversight required by the new regulations (Maynard-Moody, 1992: 16). With the modest restrictions of the National Research Act in place, the scientific community was able to resume its role as a dominant interest group working in harmony with its patron, the NIH. A modus vivendi had been reached, thus returning the situation to one of concentrated benefits for the scientific community. There were costs for anti-abortion groups, which "remained dissatisfied with the protection offered to fetuses scheduled for abortion" (p. 16) but these groups were neither tightly organized as an interest group with unitary stakes nor was fetal research the key agenda item for the movement.

Episode #4: Entrepreneurial Politics Revisited. In the 1980's, the emergence of a conservative Republican administration with links to the religious right, the existence of a number of politicians in Congress with sympathies for the anti-abortion cause, and the opportunities provided by the need for regular re-authorization of the National Institutes of Health, all combined to make another round of skirmishing over fetal research inevitable. Rep. William Dannemeyer twice (in 1982 and 1983) introduced amendments to NIH re-authorization bills that would have barred any federally funded, nontherapeutic research on the fetus (Maynard-Moody, 1992: 17). Neither was enacted. Ultimately, the Health Research Extension Act, which had been delayed since 1983, was enacted in 1985. It included a simple restatement of the 1975 rules governing fetal research. As such, it endorsed fetal research that generates crucial biomedical information that cannot be generated in any other way. In sum, "...the law returns the decision to the scientific community and sympathetic administrators" (p. 18). Anti-abortion entrepreneurs in

Congress and in the Reagan administration were left with only one weapon -- delaying tactics. Skirmishing over the composition of the new Congressional Biomedical Ethics Advisory Board, which was to appoint the committee that reviewed proposals for fetal research, effectively disrupted fetal research for several years (p. 18).

Episode #5: Interest Group Politics. In the late 1980's, another controversy over fetal research occurred. This episode was given impetus by a new line of research in which fetal tissue is transplanted into patients for the treatment of Parkinson's and other diseases. This research was destined to evoke even sharper objections from right-to-life groups, because, unlike earlier forms of fetal research, it "offers no pretext of helping the fetus" and because anti-abortionists feared that it might encourage or further legitimize abortions (Maynard-Moody, 1992: 19).

This final episode in the fetal research controversy may be characterized as interest group politics. The anti-abortion side, was, by the late 1980's, much more organized, mobilized, and represented by patrons in influential political positions than they had been earlier. Newly formed right-to-life organizations joined the fray as more established organizations such as the National Right to Life Committee became ever-more sophisticated in their lobbying and citizen action activities (Costa, 1991). Furthermore, the right-to-life side had much more concentrated stakes in the fetal tissue controversy than they had had in earlier fetal research disputes because of the stronger linkage between the research and abortion activity. And anti-abortion groups had their own version of the kind of political access that big science had long enjoyed. This was evident in the Reagan administration's imposition in 1988 of a "gag rule" prohibiting personnel at clinics receiving federal funds from providing information about abortion (Costa, 1991: 35-7).

Aware that anti-abortion groups would have concentrated stakes in fetal tissue transplantation, the NIH director sought permission from the assistant secretary for health before approving a fetal tissue transplantation experiment in 1988. In response, a human fetal tissue transplantation research panel was created, consisting of ethicists, religious leaders, physicians, lawyers, and minority group members (Culliton, 1988a: 1423). The panel, reporting in December, 1988, supported moving ahead with the research, providing that there were safeguards, such as a prohibition on sale of tissue from aborted fetuses (Culliton, 1988b: 1625). However, the Department of Health and Human Services ignored these recommendations and on Nov. 1, 1989, announced the continuation of the ban on fetal tissue transplantation (Steinbock, 1992: 170). Explaining this decision in Congressional testimony in 1990, James Mason, Assistant Secretary of HHS argued that fetal tissue transplantation would increase incentives for abortion and would be contrary to a mandate from the Bush administration and Congress that HHS not fund activities that promote abortion (U.S. House, 1990: 72).

Despite opposition from scientists and Congressional Democrats, the ban remained in place throughout the Bush administration, in part because NIH authorization legislation that would have included

an end to the ban got stalled over numerous controversial provisions, including not only the fetal tissue transplantation ban but a also a ban on allowing AIDS-infected individuals to enter the country. The fetal tissue transplantation ban was finally lifted by executive order when Clinton became president, and legislation allowing for fetal tissue research moved from the House to the Senate in May, 1993.

Evidence of Mobilization of Public Opinion. The history of fetal research presents two cases of client politics, two cases of entrepreneurial politics, and a case of interest group politics. Except for qualifications suggested by the client politics and interest group cases, the evidence in these cases is consistent with the initial hypotheses.

Figure 3 shows negligible issue salience with respect to the ethics of fetal research during both episodes of client politics. Inattention to this issue in the 1975-82 period is particularly notable, given the escalating salience of the fetus generally as new medical developments such as amniocentesis awakened popular interest and as the abortion issue simmered on the political agenda. In the 1972-3 episode, the dominant interests, the scientific community and their allies in NIH, were clearly interested in containing the scope of the conflict as they attempted to quietly develop guidelines to head off controversy. However, this early episode also suggests an unexpected fragility of client politics and a caveat about the dynamics of issue expansion. NIH's efforts to avoid public outcry over fetal research were first dashed when the Washington Post picked up the story, a story which led to the mini-demonstration at NIH that placed NIH on the defensive. These seemingly trivial developments -- a single news story and a minuscule street demonstration -- were able to bring client politics to a close and to usher in a period of entrepreneurial politics because the fetal research issue was so readily attachable to the abortion issue, and because the latter issue was such a hot-button issue in 1973. The initial impetus for issue expansion in this situation was not a faction with direct stakes in the issue, but journalists who saw the conflict potential and newsworthiness of the fetal research story.

Consistent with what has been hypothesized, issue salience appears to have been heightened as a consequence of each of the two entrepreneurial episodes. Figure 3 shows that one of the two surges in popular articles about the propriety of fetal research began in the first period of entrepreneurial politics and reached its peak at the end of the two year episode. The other of the two surges in popular articles on the fetal research controversy flowed out of the second episode of entrepreneurial politics. Furthermore, there is evidence of some of the mechanisms that political entrepreneurs use to expand the scope of the conflict. Political entrepreneurs in 1974, for example, made the unusual stipulation that the recommendations of the national commission on research ethics be made public in the Federal Register along with the HEW Secretary's response to the recommendations -- a move that clearly would increase the visibility of the commission's activities, at least to the attentive public. In the second episode of entrepreneurial politics, issue

entrepreneurs exhibited the kind of hyperbolic language that is presumably typical of efforts to inflame public passions about an issue. For example, in supporting Rep. Dannemeyer's attempt to legislate a fetal research ban in 1982, Rep. Dornan argued that "'We have sick, very sick, mentally disturbed doctors...that specialize in nothing but the destruction of human life. Then to assuage their consciences they look forward to doing research on living fetuses'" (Maynard-Moody, 1992: 17).

With regard to interest group politics, the hypothesized pattern is one of escalating popular mobilization, instigated by whoever is losing a political battle, especially if the direction of mass public opinion is favorable to that perspective. In this case, the hypothesized pattern of escalating issue visibility is clearly present. Figure 3 shows a surge in the salience of the issue, as a substantial number of popular articles emerged on the controversy.[3] An examination of listings for the peak year, 1988, shows that both scientific and religious sources contributed to the spate of articles, as Christianity Today and The Christian Century joined Science, Science News, and Scientific American in covering the story. There is also case study evidence of attempts to mobilize public concern. The congressional hearing on fetal tissue transplantation especially shows how partisan and inflammatory the seemingly technical issue of fetal tissue transplantation had become and the extent to which participants viewed the proceedings as playing to the mass public. The subcommittee chair, Democratic Rep. Henry Waxman of California, opened with charges that by sustaining the fetal tissue transplantation ban, the Bush administration "has shown greater respect for the most radical members of the anti-abortion constituency than for those Americans afflicted with such disabilities and diseases [as spinal cord injury and Parkinson's disease]" (U.S. House, 1990: 2). Rep. Thomas Bliley, a Virginia Republican charged that the "hearing is not for the benefit of the members of this subcommittee. Rather, it is a press event, and the chairman is using this subcommittee to give credibility to the barbaric practice of harvesting human fetal tissue." Bliley went on to some lurid charges about the practice, including a claim that fetal tissue researchers had admitted to harvesting fetal brain tissues when the fetal brain might not yet be dead (U.S. House, 1990: 2 and 4). Scientists testified with rhetoric designed to sway opinion in their favor, with arguments that the ban "creates a siege state of mind and a sense of government repression in conscientious scientists and physicians who are trying to advance knowledge and relieve suffering" (U.S. House, 1990: 11).

It is important to note that both sides in the conflict attempted to expand the issue to the mass public, despite the fact that majority public opinion was favorable to neither side and despite strong norms that generally constrain the scientific community from such issue expansion. There has been no systematic polling of public opinion on fetal research specifically; but because opponents of fetal research piggybacked that issue onto the abortion issue, public opinion on the latter is relevant to the analysis. Gallup polling shows that only about one-fifth of Americans are strongly anti-abortion and only about one-third are unequivocally

supportive of abortion; the majority of Americans polled show qualified support for abortion (Hugick and Saad, 1992: 6). Those opposing fetal research on grounds of abortion-related concerns did not necessarily have public opinion in their favor. The scientific community is generally averse to efforts at mobilization of broad popular attention in controversies involving science (Miller, 1983: 48); and because nontrivial numbers of citizens believe that "scientific discoveries tend to break down people's ideas of right and wrong" (Miller, 1983: 51), the scientific community could not have been certain that public opinion would be in its favor on fetal tissue transplantation.

CONCLUSIONS

Figure 4 summarizes the results for the 10 cases examined in this paper. It shows that, while the initial hypotheses demonstrate some plausibility, empirical support for most of them is qualified, suggesting the need for refinements in the hypotheses.

Figure 4. Summary of Case Analysis Results

	Disability Rights	Fetal Research
Client Politics cases:	---	Qualified
Majoritarian Politics cases:	Qualified	--
Entrepreneurial Politics cases:	Inconsistent	Consistent
Interest Group Politics cases:	Qualified	Qualified

Support for the original **client politics** hypothesis is tempered by the observed fragility of efforts to contain the fetal research issue. As initially hypothesized, popular attention to an issue will be low before, during and after an episode of client politics, but the early history of the fetal research issue shows that such episodes do not necessarily end quietly. Rather, the inside game can be unexpectedly disrupted by seemingly small things if the issue can successfully be piggybacked onto a parallel and emotional issue. Furthermore, the national news media have a "fascination with conflict" (Baumgartner and Jones, 1993: 104) which, as in the fetal research case, can bring attention to otherwise minor or technical developments. Consistent with Baumgartner and Jones' (1993) theory of the cascading effects of image change, all of this can quickly lead to a major expansion in the scope of the conflict.

Support for the **majoritarian politics** hypothesis is qualified as well. Instead of key political figures responding to a wave of public concern about a problem, with all the visibility that such a scenario entails, the early period of disability rights policy involved low-level staffers taking an initiative in advance of any demonstrable public concern about the problem. Although the initiative was consistent with generalized public interest in the disabled and with overall trends in civil rights, decisionmakers in this case

took the lead in linking these two and thereby forging a new issue -- civil rights for the disabled.

With respect to the fetal research controversy, both episodes of **entrepreneurial politics** are consistent with a hypothesis that stipulates efforts at issue expansion by political entrepreneurs and a quickening of popular interest in the issue as a result. In the disability rights case of entrepreneurial politics, however, the evidence, taken as a whole, is not consistent with the hypothesis. Both disabled groups and federal fund recipients were largely unaware of the development of a substantial disabled rights mandate in the time period in question; furthermore, the entrepreneurs in this case, bureaucrats within OCR, avoided issue expansion and popular mobilization. Although the original hypothesis concerning entrepreneurial politics does not stipulate a contingency, this may seem to suggest that the dynamics of issue expansion in cases of entrepreneurial politics are contingent upon the direction of public opinion, with issue expansion more likely to be attempted when public opinion is divided than when a valence issue is at stake. A somewhat different interpretation would focus on differences in the types of entrepreneurs in the disability rights and fetal research cases. Perhaps political officials like those who served as entrepreneurs in the fetal research case are typically more disposed to attempts at mobilizing popular opinion than are bureaucrats like those who served as entrepreneurs concerning disabled rights. The contrasts between the different cases of entrepreneurial politics suggests the need for further exploration of these possibilities, with case selection that allows for controlled comparisons to disentangle the relative importance of divided vs. consensual public opinion and elected vs. bureaucratic entrepreneurship.

The interest group cases are all generally consistent with expectations that there will be a heightening of issue salience through issue expansion; however, the cases offer some unexpected findings concerning the motivating force of being on the losing side of an issue and the significance of having the direction of public opinion in one's favor. While all cases show the surges in issue salience that are hypothesized, the disability rights history features an interest group politics case in which those who were <u>not</u> on the losing side nevertheless engaged in strong issue expansion, presumably because public opinion was so much in their favor that the use of this trump card even when the outcome was barely in doubt was irresistible. In that case, the direction of public opinion seems to be more important than which group is on the losing side. In the fetal tissue case of interest group politics, both sides were actively engaged in efforts to mobilize the public even though the direction of public opinion clearly favored neither side. The fact that both right-to-life interests and the scientific community engaged in issue expansion suggests that situations of divided opinion or uncertainty about the direction of public opinion may be particularly conducive to efforts at mobilization of public opinion, as both sides fight for the soul of the silent majority. This contingency was not envisioned in the original hypothesis.

FOOTNOTES

[1]Others have also used a count of the number of relevant articles in the Readers' Guide as a way of measuring issue salience (Wood and Anderson, 1993: 13; Jones and Baumgartner, 1993: 50)

[2]The falling out is said to have occurred when members of the presidential science advisory committee criticized Nixon administration policies and when university-based scientists appeared in the vanguard of Vietnam anti-war protest (Dickson, 1984: 18; 30-31).

[3]As was the case in analysis of disability rights, it is unclear whether this surge of popular attention should count as evidence with respect to the interest group politics episode in which it is embedded or, as noted above, as evidence for the mobilizing effect of the entrepreneurial politics episode that immediately preceded it. As a result of this ambiguity, other forms of evidence of attempts at issue expansion are particularly important in interpreting this case.

Prepared for delivery at the 89th Annual Meeting of the American Political Science Association, September 2-5, 1993, Washington, D.C. The authors wish to thank Eric Plutzer for his valuable advice, Lisa Nelmida for her research assistance, and Kathy Shelley for essential help in resolving computing problems.

Abstract

Cultural issues such as "moral decline," school prayer, feminism, pornography, abortion, and homosexual rights represent political struggle over ideals and values in American society. Mass belief systems (attitudes on specific issues) undoubtedly will play a major role in defining the success or failure of forces locked in combat over the definition of America's cultural norms. This paper looks at trends in mass attitudes on "cultural issues," identified through investigation of data found in the National Opinion Research Center (NORC). The data analysis provides insight into the size, stability, and cohesion of attitudinal groupings in American society. Each of these factors will have great impact in terms of predicting implementation and political consequences of the cultural agenda.

Consistency or Change in Issue Dimensions of the Cultural War

> [Unless America returns to] her Christian roots ... she will continue to legalize sodomy, slaughter innocent babies, destroy the minds of her children, squander her resources and sink into oblivion.
>
> -- Rev. Pat Robertson

> There is a religious war going on.... We must take back our cities, and take back our culture, and take back our country.
>
> -- Patrick J. Buchanan

> Over the last three decades we have experienced substantial social regression. Today the forces of social decomposition are challenging--and in some instances, overtaking--the forces of social composition. And when decomposition takes hold, it exacts an enormous human cost.
>
> -- William J. Bennett

Introduction.

The broadcast and print media have widely hailed the dimensions of "cultural warfare," projecting visions of secular and nonsecular interests battling for dominance within the pluralistic American arena. An array of popular commentaries by, among others, Rush Limbaugh, Pat Robertson, William Bennett, George Will, Patrick J. Buchanan, have decried the drift toward what they revile as "secular humanism," countercultural lifestyles, and generally amoral behavior. "The 700 Club," a widely-watched television program hosted by Pat Robertson, is one of the more widely available mass media sources broadcasting conservative religious and cultural views. That telecast provides particularly explicit regular reference to the theme addressed in this paper, through a major continuing segment of programming supplying one-sided reporting on "scenes from the culture wars."

On the other side of the debate, analysts look with horror at the rise of the "religious Right" and its political agenda. Political ambitions like those of Pat Robertson's Christian Coalition and its allies are viewed with apprehension by those who believe that American "morality squads" would impose a strict religious orthodoxy on the nation. A recent mailing from the American Civil Liberties Union (ACLU, 1993), intended to stimulate its membership growth, provides a particularly stark picture of the intensity and breadth of the cultural struggle:

> Not until after the summer of 1992, when the Republican National Convention featured these hateful speeches of Pat Robertson and Pat Buchanan, did the media begin to pay attention to the re-emergence of a massively funded and dangerous political force. A force that is now threatening civil liberties in virtually every community in America and will continue to do so--with even greater intensity at the local level now that the White House opposes their agenda.
>
> However, here at the American Civil Liberties Union we had already been watching for some time--and with growing alarm--the deliberately quiet revival of the Christian Coalition, the well-funded heir to the more visible and flamboyant "Moral Majority" assembled by Rev. Jerry Falwell a decade ago.
>
> Unlike the old Moral Majority, this new right-wing movement tried carefully at first to avoid publicity. In the words of the Christian Coalition's executive director, "We're flying below radar."
>
> Why were they operating in such secrecy? Because their "stealth strategy called for an "invasion at the grassroots." Their goal? To elect "pro-family Christians," particularly at the state and local level where the ultimate outcome of key social issues--like the fight to protect freedom of expression against censorship, to keep church and state separate, to prevent discrimination against gay men and lesbians and to preserve reproductive rights--will be determined. Their method? To prey upon the fears of millions of people who are all too willing to believe that sacrificing personal liberty will help solve our nation's problems.
>
> In last fall's [1993] elections, for example, some 600 evangelical candidates were fielded by Robertson's Christian Coalition--and 40% of them won election to offices ranging from state legislatures to school boards! Robertson spent $13 million on telephone banks, church-based voter registration, and the distribution of 40 million so-called "Christian" voter guides. His Christian Coalition activists helped defeat Iowa's referendum on an Equal Rights Amendment and succeeded in making discrimination against gay men and lesbians legal in Colorado. And in May 1993, they invaded New York City, made an alliance with the Catholic Archdiocese, and attempted to take over 31 local school board elections, so they could impose their unconstitutional policies.

The political activism of Robertson's Christian Coalition is illustrative of tactics employed by the religious Right in their struggle against what is perceived to be a drift toward "secular humanism" in American society. Since politicians make policy, then it appears that one way to change policy is to elect representatives with the correct (Christian) values. Battle lines have been drawn over key issues, such as abortion, pornography, homosexuality, and school prayer. Other issues, ranging from creationism, the distribution of condoms, feminism, school choice, middle-class tax relief, the role of the Federal Reserve Board, and the role of the United Nations, also appear to be of

concern for the religious Right (Des Moines Register, 1992).

Conservative groups such as Pat Robertson's Christian Coalition, Phyllis Schlafly's Eagle Forum, the National Right to Life Committee, and Randall Terry's Operation Rescue engage in ideological debate with groups organized to foster a more open society, such as Norman Lear's People for the American Way, the National Organization for Women, the National Gay and Lesbian Task Force, Planned Parenthood, and the American Civil Liberties Union. The outcome of such debate is far from certain, and is likely to be influenced by factors such as the attitudes of voters on "moral issues," the stability or volatility of those attitudes, and the cohesion of that attitude structure.

Voter attitudes on moralistic "social" issues have consistently been cited for their political relevance, either as a "wedge" to break up traditional Democratic voting blocs or as a threat to the internal cohesion of Republicans who are attempting to coexist under the "big tent." Such linkages between religiously-grounded attitudes and politics is not new, even in the United States, which purports to have been founded on a strict separation between church and state. The moralistic issues of slavery and temperance, for example, have had a major impact on American politics. Similarly, moralism appears to be a major force in the world today. Religious fundamentalism appears to be an especially vibrant force, as evidenced by events such as the Iranian revolution, the rise of the religious Right in the United States, the militancy of Jewish settlers on the West Bank of the Jordan River, the communal riots that followed the Hindu-led destruction of a mosque in India, and the efforts of Croats and Serbs to cleanse Bosnia of Muslims. These events, and others, have led to speculation that religious fundamentalism represents the last great ideological upsurge of the 20th century (New York Times, 1993).

The role of religion in modern American society has been the subject of a substantial, and growing, social science literature. Wills (1990, pp. 15-16), for example, notes the inextricable interplay between politics and religious impulses:

> ... nothing has been more stable in our history, nothing less budgeable, than religious belief and practice. Religion does not shift or waver; the attention of its observers does. Public notice, like a restless spotlight, returns at intervals to believers' goings-on, finds them still going on, and, with expressions of astonishment or dread, declares that religion is undergoing some kind of "boom" or revival.... Revivalism does not need to be revived. Revival is, like respiration, the condition of its life.

Such a view is decidedly at odds with prevailing views of American society as steeped in pragmatism, optimism, and secularism (Commager, 1950; Hartz, 1955). The evangelical counterattack involves the belief that "secular humanists" are in fact imposing their own nontheistic religion upon society, and that it is the duty of evangelicals to rescue the Constitution from the establishment of irreligion (LaHaye, 1986). Wills (1990, p. 92) concludes that:

> Clearly, in our society, two large groups are talking past each other. One fails to see legitimacy in religious values not comprehended by the American Mind. The other fails to see legitimacy in irreligion: If secularity is really religious, then it is diabolic--a plot against God, not mere indifference to Him.

There is nothing particularly new nor novel in characterizing the American public as steeped in religious sentiments. Gallup and Castelli (1989) report, for example, that: (a) about 90% of Americans say they have never doubted the existence of God, (b) about 80% of Americans say that they believe they will be called to answer for their sins before God on Judgment Day, (c) about 80% of Americans believe that God still works miracles, (d) about 70% of Americans believe in life after death, (e) 37% of Americans believe in a personal devil, (f) about 50% of Americans believe in angels, (g) about 40% of Americans attend church in a typical week (compared to just 14% in Great Britain and 12% in France), (h) over 90% of Americans say that they pray at some time during an average week, (i) Americans rank very highly, trailing only Malta, in rating the importance of God in their lives, (j) 37% of Americans say they would be more likely to vote for a candidate who said that Jesus was his savior, and (k) 37% believe in the existence of the Devil. Greeley (1989) further attests to the lack of secularization within the mass public. Wills (1990, p. 25) asserts that: "[r]eligion has been at the center of our major political crises, which are always moral crises--the supporting and opposing of wars, of slavery, of corporate power, of civil rights, of sexual codes, of 'the West,' of American separatism and claims to empire."

This preoccupation throughout American history with religious precepts and practice carries over to politics and voting behavior. Kleppner (1970), in a study of voting patterns during the Populist era, found that religious styles were more predictive of voting behavior than were more traditional economic, class, regional, or other predictors. Gallup and Castelli (1989, pp. 227, 249) conclude: "Religious affiliation remains one of the most accurate, and least appreciated, political indicators available." Greeley (1989, p. 50) also notes that "strength of affiliation with either party does indeed correlate with strength of church-going propensity."

How religion might influence contemporary elections, public policy, values, norms, and American culture are questions of great interest. Such questions may not be able to be answered definitively at this moment, yet the analysis of attitudinal data will help, at least, to assess the odds for or against the acceptance and inculcation of specific value orientations. Controversy surrounding President Clinton's initial proposal and subsequent backtracking on the "gays in the military" issue, and his withdrawal of the Lani Guanier nomination as chief civil rights officer within the Department of Justice, perhaps are illustrative of the role of popular opinion in reining in policies that

may be perceived by some to be "out of the mainstream."

Modern Evangelism and Cultural Politics

The connection between religious fundamentalism and the body politic is far from new in the political history of the United States. Such associations have been commonplace. Religious themes appear to advance and recede over time, with spokespersons such as Pat Robertson, Jesse Jackson, Louis Farrakan, and Jerry Falwell being represented by corollary figures in the nation's past. Issues such as moral degeneration, the Vietnam war, social justice, prohibition, the abolition of slavery, and a host of others have seized the attention of ministers in the past. The values and ethics endorsed in American Protestantism, however, appear to have occupied the greatest share of space within the enunciation of the American ideal, and continue to predominate. Evangelical movements within Protestantism appear to represent the most vibrant force within the faith.

Marsden (1980, p. 6) refers to evangelical Protestantism as "the dominant force in American life" and as the "unofficial religious establishment" of politics during the nineteenth century. Wills (1990, p. 19) asserts that "[t]he mainstream of American religion has always been evangelical." The experiential emphasis of fundamentalism has been asserted to have played a major role in the spread of democratic values in American political history (Hatch, 1989). Experiential religion in America is said (Wills, 1989, p. 20) to be eclectic and difficult to compartmentalize, as it incorporates elements of revivalism, the literal interpretation of biblical text, and millennial aspiration for the Second Coming of Christ. It is noteworthy that the first national political party convention was conducted by the Antimasonic party, which rose to prominence as the institutionalized proponent of a strongly evangelical and populist aversion to Freemasonry as "an infidel society at war with true Christianity" (Richards, 1986, p. 43). The theological basis for early interpretations of the American (and, more broadly, New World) role in the firmament is emphasized by Wills (1990, p. 137):

> If Christianity began with "ultimists," so did America. Cotton Mather thought the early settlements on this continent could only be understood theologically, as a series of wonders and portents. He called the history of his country "Christ's Great Deeds in America," Magnalia Christi Americana. Modern fundamentalists are not going all the way back to early Christianity, without any intervening stops. They are going, in the first place, back to the foundation (fundamentals) of European government on this continent. To make even this shorter trip toward "basics" is to enter a world of signs and prophecies. It returns us to the terror and exaltation of people mounting above history to meet their Maker in the air--which is the spirit in which the settlers of America launched themselves toward the unknown.

To a certain extent, the growing assertiveness and visibility of evangelical movements, and their vocal opposition to what is perceived by many of that persuasion to be a drift by the nation toward moral decline, account for the scope and intensity of the cultural conflict that occurs in the United States today. Furthermore, it appears that growth in the ranks of evangelical movement is beginning to have political impacts which will play major roles in future elections at all levels of government. The linkage between contemporary evangelical forces and politics therefore warrants closer scrutiny.

The numerical scale of the definable evangelical component of the population of the United States is large, and the relevant numbers are of great and obvious political relevance. Gallup and Castelli (1989) found that evangelicals make up the largest number of self-identified Christians, and that fully 40% of adults refer to themselves as "born again." If "evangelicals" are defined as those who emphasize the personal experience of being saved, then they constitute (Gallup and Castelli, pp. 93-94) 57% of Baptists, 32% of Methodists, 29% of Lutherans, 27% of Presbyterians, 14% of the nation's Episcopalians, but just 1% of Mormons. In addition, African Americans are overrepresented among evangelicals. African-American respondents to a 1981 international Gallup survey scored the highest (9.04, out of a maximum of 10) in ranking the importance of God in their lives (Gallup and Castelli, 1989, pp. 122-123). Gallup and Castelli (1989) report that African Americans are more likely than other groups in the United States to read the Bible frequently, and are more likely to say they would invite others to attend their church. In addition to the massive presence of African-American evangelicals, increasing numbers of Hispanics are leaving the Catholic church in favor of more evangelical denominations (Gallup and Castelli, 1989). Greeley (1990, p. 120) estimates that approximately 60,000 Catholics of Hispanic origin are defecting each year to Protestant denominations.

Though they generally are also classifiable as evangelicals, fundamentalists place greater emphasis on preserving orthodox doctrine. Evangelicals who do not tend toward the fundamentalist impulse are more likely to accentuate the religious experiences of rebirth (revivalists), expressions and actions of holiness (perfectionists), or gifts of the Spirit (Pentecostalists) (Wills, 1990, p. 388). Although fundamentalists are less numerous than evangelicals, they may still constitute a potent 20% of the electorate (Greeley, 1989, p. 19) which may be ignored only at the potential political peril of parties or candidates that disregard their impact.

While evangelical Protestantism may have always been a major component of American history, of greater salience for the purposes of political research is the role that Protestantism may play in contemporary America and in the politics of the United States in the near future. The following questions, at a minimum, are of interest to political

scientists: How is the apparent upsurge in American fundamentalism in the United States during the last quarter of the twentieth century to be explained, how much political power can it muster, and how durable is the movement? According to Wills (1990), this apparent upsurge in evangelical groups' activity and visibility is attributable in part to elite disenchantment with religion. To the extent that it may have permeated media and scholarly debate (as manifested in the "God is dead" rhetoric) during the 1960s, such elite disenchantment may have tended to obscure the maintenance, and even the growth, of evangelical churches at a time when mainline denominations were indeed losing adherents (Gallup and Castelli, 1989). Wills (1990, p. 21) suggests that a social divide in attitudes toward the experiential relevance of religion then led to a counterattack from fundamentalist elements during the 1970s:

> An evaporation of belief toward the top of the socioeconomic scale occurs regularly in America. Doctrine thins out there--as among Unitarians early in the nineteenth century, or theological liberals early in the twentieth. This is seen as a betrayal of belief by those lower in the scale, who often compensate with a renewal of their own fervor--as the fundamentalists did in responding to theological liberals. Part of the evangelical "resurgence" of the 1970s was a matter of new voices being heard as the elite denominations fell silent on religion, learning to speak in more secular terms. The religious vote has been, increasingly, an evangelical vote, a fact that helps explain the tendency of recent presidents to proclaim themselves born again--Ford, Carter, Reagan, Bush.

It is tempting to add Clinton to Wills' list of recent presidents who have attempted either to exploit or dissipate the partisan slide of evangelical voters. Although he did not profess as clear a personal attachment as did his 1992 opponent to fundamentalist premises, his southern Baptist and comparatively humble family background certainly would have appeared to be more attractive than the patrician Episcopalian background of Bush to large segments of the evangelical electorate.

The predominantly Protestant orientation of contemporary political strains of American fundamentalism are evident from major changes in the denominational composition among religious conservatives in the latter half of the twentieth century. The most signal transformation has been changed perceptions among American Catholics, largely predicated on attitudes toward sexual practices. Greeley (1990, p. 97) found that twice as large a proportion among Catholics as among Protestants now are accepting of premarital sex, a complete reversal from earlier patterns. Gallup and Castelli (1989), among others, have shown that attitudes toward abortion among Catholics now differ little from the national norm. Fowler (1987) suggests that evangelicals came relatively late, after Catholics, to the issue of abortion, and that their current activism over the issue may be regarded as doing penance for their previous neglect of what now has become a galvanizing element among both "prochoice" and "prolife" elements in modern society. Gallup and Castelli (1989, p. 178) argue: "The backbone of the antiabortion movement comes increasingly from white evangelicals, not Catholics.... There may be no other issue that so clearly differentiates the views of white evangelical and white non-evangelical Protestants." Wills (1990:320) reports that evangelicals have now taken from Catholics the role of leadership in "prolife" activism.

The social and political role of women provides another flashpoint for mobilization of the conservative evangelical movement. Although they come to approximately the same conclusions regarding gender roles, traditional Catholics and evangelical Protestants arrive at that common perspective through different paths. Among Catholic authorities, the subsidiary role for women is an outgrowth in large part of conceiving of the traditional celibate male priest as the pinnacle of human commitment. Fundamentalists within the evangelical community rest their interpretations on biblical exegesis, centered on Pauline doctrine. The outcome, however, is the same:

> Both claim they want to protect women--by the suppression of pornography, by the rejection of any alternative to heterosexual and monogamous marriage except celibacy. But this protection often looks like sequestration, so that a prominent Catholic like Phyllis Schlafly and a prominent evangelical like Beverly LaHaye oppose feminism as a challenge to the home, where a woman should be enshrined (or imprisoned, according to one's view). The two fundamentalisms converge in their opposition to things like the Equal Rights Amendment (Wills, 1990, pp. 329-330).

The confluence of cross-denominational antifeminist reaction is made explicit in fundamentalist writing. For example, Allen and Allen (1985:25) praise both Catholic and militant evangelical Protestant action:

> We wish to join the sentiment of Concerned Women for America in rejecting the arrogance of such feminist groups as the National Organization for Women (NOW) in their presumptuous claims that they speak for the women of America. If for no other reason than to cry foul against an unfair tactic, traditionalists such as Beverly LaHaye, the president of Concerned Women for America and the wife of Moral Majority cofounder Tim LaHaye, and Phyllis Schlafly, the president of Eagle Forum and an outspoken foe of the women's movement, should be applauded. Millions of women (and men) are neither sympathetic to nor supportive of the goals of the secular feminist movement.

The heavy reliance on biblical textual guidance to justify the subordination of women is a staple of fundamentalist writings (Schaeffer, 1982; Allen and Allen, 1985; Ham and Taylor, 1988). Wood (1990) argues that the fundamentalist position regarding the role and duty of women parallels the biblical support that fundamentalists once found for 19th-century slavery. Wills (1990, pp. 332, 336-337) concludes that

> ... the fundamentalist view of creation is not simply a doctrinal nicety, or even a protest against social Darwinism in accord with [William Jennings] Bryan's position of the 1920s. It is also the basis of a social agenda deeply opposed to liberation from the patriarchical family. That is the context that makes it easier for evangelicals to see women's duty as preservation of the male seed in all cases....
>
> Refusal to abandon the celibate male priesthood has the same impact on Catholic reaction to women's rights as does the biblical fundamentalism about Paul's words to the Corinthians. Individuals can edge away from institutional restraints--Paul Jewett easing off from inerrancy, Catholics simply ignoring their bishops when they pontificate on sex. But this involves both groups in great friction within their own body and with their fellow citizens who take a different view of women's rights.

The potential electoral consequences of the contemporary evangelical movement are, of course, central to any analysis of the "culture wars." These consequences are particularly important at the level of national partisanship, with clear ramifications for the outcome of presidential, as well as of congressional, elections. A clear shift toward Republican affiliation within the evangelical community was evident during the 1980s. Himmelstein (1990) reports that the distribution of partisanship among evangelicals changed from 40% Democratic and 37% Republican, in 1980, to 45% Republican and just 29% Democratic, in 1984. Further, among the evangelical elite, ministers underwent a much stronger transformation, from only 29% Republican in 1980 to fully 66% Republican in 1984. Wills (1990, p. 388) attributes the upsurge in Republican support in 1984 to increased activism among those with prior evangelical leanings, and to a massive switch within that segment of the electorate from Democratic to Republican voting tendencies due to disenchantment with Carter and growing admiration for Reagan, particularly in the South, rather than to any growth in evangelicals' numerical strength.

One consequence of the heightened impact of evangelical faith on American politics is the emergence of a "cultural war," as manifested in attacks on pornography, homosexuality, abortion, the criticism of mainstream cultural icons such as rock music and television (Wills, 1990, p. 24). Wills (1990, pp. 24-25) interprets antiabortion and antipornography activism as parts of a battle for the preservation of family values and civilization: "The struggle for a nation's soul is under way, with the new millennialism as a kind of deadline set for all sides."

Wills (1990, p. 36) concludes that this battle suffuses the debate over social issues which confront the nation, and that appropriate leadership, particularly in the presidency, is imperative in order to provide the sort of moral leadership that is required to address those issues in terms understood by the evangelical component of the electorate. The intertwining of leadership with morality was evident during the 1988 presidential campaign, particularly regarding the flag-and-patriotism "wedge issue" used effectively by the Bush campaign against Democratic challenger Michael Dukakis. The tie to evangelical values is clear from the invocation to the Deity incorporated into the pledge of allegiance since 1954, an insertion that transforms an affirmation of nationhood into an affirmation of faith.

Even clearer is the version of the pledge that is used in at least some independent Christian schools, which begins with the invocation: "We pledge allegiance to the Christian flag, and to our Savior, for whom it stands..." (d'Antonio, 1989, p. 41). In the presence of Supreme Court rulings which have severely restricted Bible readings and daily prayer from public schools, this modified pledge has become one permissible remaining way to connect belief in God directly with national loyalty (Wills, 1990, p. 81). This tie-in was used to perfection by the Bush campaign in 1988, to help mobilize evangelical opposition to Dukakis' secularist perspectives on flag worship and separation of church and state. Similarly, Dukakis's membership in the American Civil Liberties Union became a flashpoint, mobilizing issue, attesting both to what evangelicals were likely to regard as his perceived allegiance to secular extremism and to their virtual siege mentality, in which it is common to regard groups such as the ACLU and its supporters as agents of a conspiracy to destroy everything that they hold quite literally sacred.

The linkage between religion and politics is evident at the grassroots organizational level in states such as Iowa, where the caucus process enables dedicated and committed activists to gain influence in the process. Kenneth Pins, of the Des Moines Register, stated:

> Conservative Christians are a powerful and growing force in the Republican Party--especially in Iowa with its wide-open party caucus process--and they are unlike most political forces that have come before. They now hold seven of the 17 seats on the State Central Committee, which controls the internal workings of the Republican Party of Iowa. They wrote the state platform and they held at least 40 or Iowa's 46 seats at the GOP National Convention. They are electing members to the Iowa Legislature and stepping up pressure on local school officials, and they are changing the terms of political discourse. Debates on the party platform now often center on interpretation of the Bible. They are well-positioned to deliver the 1996 Republican precinct caucuses in Iowa to a conservative of their liking. They also are driving moderates out of the Republican Party (Pins, 1992a, p. A1).

Fears that the religious Right will eviscerate the strength of the Republican party by driving out moderates has been expressed by leading Republicans. In 1992, U.S. Senators Nancy Kassebaum, Arlen Specter, and others formed the Republican Majority Coalition to "combat the religious right's effort to seize control of the Republican Party (Pins, 1992a). "Moderate" Republicans, such as congressman Jim Leach of Iowa, appear to be cognizant of the growing influence

of religious groups. Leach stated that "the moderate wing of the party has let the party down very dramatically," and that "new entrants are more disciplined, they are more organized and they are more committed" than party regulars (Yepsen, 1993). However, the fear that the religious Right will position the Republican Party in an extreme position, and as a result become inconsequential, has been refuted to some extent in the state of Iowa. Des Moines Register political columnist David Yepsen (1993) reported:

> It's getting difficult for Republican moderates to argue that the Iowa GOP has been hurt by the political activism of the evangelicals and conservative Catholics. In Iowa, the party won two hotly contested congressional races and took control of the Iowa House, in part because of the activism of these conservative Christians, who also mobilized to fight the state Equal Rights Amendment. These voters--often operating at the goading of Pat Robertson's Christian Coalition--are giving some new energy to the Republican Party, shifting it to the right and eroding the Democratic base. Moderate Republicans and liberal Democrats are left crying in their Cabernet.
>
> Evangelicals will continue to have an impact on Iowa politics. Many of the newly elected Iowa legislators are either evangelicals themselves or are conservatives who won their seats with the heavy backing of these voters. Some evangelicals are more interested in school board elections than anything else. Evangelicals and conservative Catholics were successful because their message is attracting a lot of people who don't go to church. A lot of plain, ordinary folks who pay their taxes, go to work every day and try to raise their kids correctly are fed up--repeat fed up--with drugs, messed-up schools, guns, gangs, crooked politicians and all the other rot that plagues our society.

When the Iowa Legislature approved a mandate (Human Growth and Development mandate), to make sure that students were armed with certain facts about sexuality, an organization named Free World Research was formed. The leader of the organization, Wayne Wolf, believed that some of the materials (developed by Planned Parenthood) were too graphic and inappropriate. The next issue of the monthly newsletter Iowa Report (distribution of approximately 10,000 copies) asserted that "U.S. Education Secretary Lamar Alexander is under the influence of New Age religious ideas," and called some of the Iowa Department of Education's plans "politically correct indoctrination" (Pins, 1992b). The attack on the Iowa public school system resurfaced in the 1992 Iowa Republican Party Platform, which called for the dismissal of the director of the Iowa Department of Education and for the dismantling of both the state and federal Departments of Education. The platform further stated:

> We oppose the promotion of secular humanism, 'political correctness,' New Age concepts, the PETA [People for the Ethical Treatment of Animals] philosophy, one-world government, situational ethics and the teaching of homosexuality as an acceptable life-style or behavior. We support repeal of Iowa's Global Education mandate, the Human Growth and Development mandate, and the American 2000 plan (Pins, 1992b).

Efforts on the part of conservative Catholic and evangelical Protestants to acquire political power have also been apparent in other areas of the nation, such as New York City, where elections to the local school boards and the replacement of Joseph A. Fernandez, former chancellor of the city school system, has been sources of major controversy and of national interest. The vote by the citywide Board of Education, by 4 to 3, not to renew Fernandez's contract was attributed, at least in part, to his allegedly having spent too much time on issues such as distributing condoms in schools and teaching respect for homosexuals (McKinley, Jr., 1993). Activism in the New York City school board races of May, 1993, by supporters of Pat Robertson's Christian Coalition, provoked a worried response on the part of individual citizens and liberal groups who were concerned that conservative candidates might tie up city school boards with initiatives like teaching creationism, restricting sex education, banning books, and instituting school prayer. As a result of these concerns, gay-rights advocates, liberal clergy, and some parents' and teachers' groups organized more aggressively than ever before to influence the local school board elections (Dillon, 1993).

Results of the New York City school board elections suggested that, while New York's volatile issues of condom distribution in schools and programs to teach sexual and racial tolerance had captured a great deal of media attention, it did not stimulate an outpouring of voter interest. More than 90% of the eligible voters chose to stay home on the day that 288 local school-board communities were up for vote. Furthermore, it appeared that, in the handful of communities, such as Jacksonville, Florida, where conservative Christians have won working majorities on local school boards, they have done little to alter the curriculum. Further inroads of conservative Christians have been blocked in San Diego, California, where, in 1990, they nearly won control of the 43 school boards in the metropolitan area. Only modest changes have been instituted in schools, yet rhetorical fires have been fanned, and the "battle for control of the nation's schools" will continue to be a focal point of the "cultural war." Woodward, Foote, and Tanner (1993, p. 62) reported:

> Though they may have aroused passions in only a few dozen local communities, right-wing Christian groups will continue to train local churchgoers in the politics of public education. Any why not? This is a democracy and they're entitled to compete for votes. But to date the contenders for the nation's schools are mostly talking tough, with national organizations on either side demonizing each other to raise funds--and sow fear in the populace.

Attitudes toward gays reflect deep divisions and diverse trends in American society. Elections in 1993 more than

doubled the number of openly gay officials in municipal offices, to about 120. A lesbian was elected to the high-profile position as a member of the Los Angeles City Council, and a gay man was elected to a city council seat in Dallas. In May of 1993, lesbian activist Roberta Achtenberg won confirmation as assistant secretary of fair housing and equal opportunity in the Department of Housing and Urban Development. Achtenberg was confirmed by a vote of 59-31, despite a floor fight led by Senator Jesse Helms (R-N.C.),who castigated the Senate for its decision to "install into the federal bureaucracy a militantly activist lesbian" (Des Moines Register, 1993).

Other signs exist of a growing acceptance of gays and gay lifestyles. In 1993, Hawaii's Supreme Court ruled that gay marriages in that state may be legal. Other state courts have expanded gay rights. Senator Edward Kennedy and Representative Henry Waxman planned to introduce a bill that would protect gays from discrimination by employers, landlords, hotels, restaurants, and other public places. Gays have support in Washington from groups such as the National Association for the Advancement of Colored People and the AFL-CIO. In 1992, voters in Oregon defeated a statewide ballot initiative declaring homosexuality "abnormal, wrong, unnatural, and perverse." A recent (1993) poll showed that 65% of respondents said they wanted to ensure equal rights for gay people (Shapiro, Cook, and Krackov, 1993).

While some trends appear to favor the expansion of gay rights, at the same time a number of countercurrents are evident. Colorado passed a more subtly phrased anti-gay ordinance than the Oregon version in 1992. Colorado-style measures are being promoted in 17 states and numerous cities for votes in 1993 and 1994. In New York City, an elementary-school curriculum was changed after parents and educators complained that it was propagandistic and inappropriate, since it was "value-blind" in teaching first-graders that gay families were essentially not different from traditional families. In 1992, there were 1,898 hate crimes reported against gays and lesbians in just five major cities. A 1993 pool found that 73% of respondents opposed same-sex marriages, 60% opposed legal partnerships for gay couples, 70% objected to letting gays adopt children, 52% opposed teaching about gay orientation in sex education classes in public schools, and 50% opposed extending civil-rights laws to cover homosexuals. Very large proportions of people who hold anti-gay views are said to feel "very strongly" about them (Shapiro, Cook, and Krackov, 1993).

It appears that a polarization of pro- and anti-gay views may be developing within the electorate. Such polarization is unlikely to produce compromise, and may further mobilize one group to defeat the other. Also, homosexuality is by no means the only issue in the cultural battlefield. Controversy over issues such as condom distribution, abortion, and feminism are indicative of the broader cultural debate and concern within American society. To a certain extent, insight into the expected outcomes of such controversies can be surmised from analysis of historical and existing attitude structures.

The linkage in the United States between voting preference and religion has been established in numerous studies (Wald and Shye, 1993; Stanley and Niemi, 1991; Strate et al., 1989; Cohen and Kapsis, 1977). In the Wald and Shye (1993, p. 11) study of electoral behavior in Israel, the authors concluded that religious involvement contributed significantly to political involvement. The greater the level of religious involvement, the greater the tendency to favor parties in the religious camp, the right-wing bloc, and Likud identification. Other recent studies have found support for the linkage between religion and political behavior (Kiecolt and Nelson, 1991; Jelen, 1991a, 1991b; Cornwall, 1989; Breault, 1989).

Peterson (1992) found that religion has clear political significance for individual voters in the United States, with greater involvement in church life associated with conservative views and politicization. A "spillover effect" of church participation was noted, as the increased church involvement was believed to contribute to the self-confidence necessary for participation in other areas of life such as politics. Wald (1989) noted that greater church involvement internalizes church doctrine, and that higher a level of social integration into the church was associated with a greater likelihood of voting for Reagan in 1980. Petrocik and Steeper (1987) further elaborated on this association, finding church attendance to be increasingly related to partisan identification since 1980. Regular churchgoers were discovered to have become steadily more Republican, with non-churchgoers remaining more heavily Democratic than Republican. It is recognized, however, by the authors that church attendance by itself may not have a great impact on partisan affiliation, since attendance may be a proxy for other factors such as traditional values and patriotism.

Region was found to affect the relationship between religion and political behavior. According to Kiecolt and Nelson (1991), white evangelicals outside the South were becoming steadily more Republican, yet such behavior was not replicated in the South. Older Democratic party loyalties in the South may account for this lack of consistency between areas. The size of the evangelical "bloc" (if indeed it votes as a bloc) is another area of controversy in the literature. Estimates vary widely, with some analysts (Smidt, 1987) contending that evangelicals represent a very large group of voters with distinctive political views, and others (Brudney and Copeland, 1984) contending that the "religious Right" constitutes only five to six percent of the population. It was observed, however, that evangelicals were more likely to vote, were more likely to be conservative than the rest of the population, and in the South were less likely to make voting choices based on standard political referents. In the South, young evangelicals differed from their older evangelical brethren in partisanship, in that they are more likely to be Republican, and therefore

seemed to represent an emergent new generation in voting behavior.

Althaus (1993, pp. 10-11) compared "born again" voters with others, and concluded that there was no significant difference between groups on party identification, policy issues, or presidential voting patterns. Choosing between the Democratic and Republican parties was viewed to be more closely related to policy and ideological positions than to a "moral or religious imperative." Single-dimensional studies, such as Althaus's (1993), are useful, yet do not provide the richness and intellectual completeness of a multiple-issue study. Such a study can assess the degree to which certain policy attitudes coalesce along a single dimension. Multidimensional analysis therefore can provide a richer understanding of whether or not a cohesive group of attitudes can be found. Furthermore, if such attitudes coalesce along a single dimension, one can explore the degree to which such a multidimensional grouping will remain intact, once noncultural economic variables are introduced. Such a study which assesses the durability of culturally-based alignments can provide insight into future outcomes of the "culture war."

Speculatively, a number of scenarios are possible, such as the "moral Right" splitting apart once class considerations are introduced. Skerry (1978) concluded, for example, that abortion attitudes represented a "class war" between social elites who were pro-choice, and pro-life advocates who were in the lower social strata. More cohesive grouping of both "moral conservatives" and "moral liberals" would suggest that polarization is more likely to have greater permanence and that compromise is less likely between two antagonistic perspectives. In such a scenario, one side is likely to emerge and dominate the "moral agenda." Luker (1984) identified competing worldviews among pro-life and pro-choice activists, with political conservatism linked to anti-abortion attitudes at both the elite (Guth, et al., 1993) and mass (Wilcox and Gomez, 1990) levels. If such competing worldviews extended to the broader cultural agenda, and if such views were durable predictors of voting behavior or of partisanship once controls were introduced, then a Downsian unidimensional distribution of voter attitudes from left to right would not be identified. The view of Scammon and Wattenberg (1970) that "the only extreme that is attractive to the large majority of American voters is the extreme center" can be disputed, if an increasingly bipolar distribution of attitudes can be found. The extent to which such attitudes determine voting after other considerations are introduced will, to a certain extent, predict the degree of cultural polarization and the outcomes of present "cultural warfare."

Attitude Dimensionality.

A central research problem to be addressed in this paper is the extent to which attitudes among the American mass public on matters of morality fall along multiple dimensions. The evidence from previous studies is mixed. Fleishman (1988, p. 159) found that "[s]ocial and political attitudes are organized along at least two uncorrelated dimensions: economic welfare policy, on the one hand, and individual liberty, on the other." Similarly, Converse (1964) argued that, owing to the absence of constraint in attitude formation within the mass public, specific attitudes do not reflect a single abstract liberal/conservative ideology. In contrast to Converse, other researchers have argued (e.g., Nie and Andersen, 1974; Nie, Verba, and Petrocik, 1976) that there is, or at least that there has developed over time, a greater degree of consistency in mass public attitudes. However, methodological debate regarding the role of question wording and format in this apparent increase in attitudinal constraint abounds (e.g., Bishop, Oldendick, and Tuchfarber, 1978; Sullivan, Pieresen, and Marcus, 1978) as to the validity of this conclusion.

The dominant theme of results from related statistical research on attitudinal construct suggests the presence of multiple dimensions. Luttbeg (1968) derived four factors among attitudes to ten local political issues. Stimson (1975) reported between two and four factors for subsamples, varying in cognitive sophistication, in a study of the 1972 American National Election Study (ANES). In a separate analysis of the same 1972 data, Kritzer (1978) obtained three factors for non-elite respondents. Knoke's (1979) confirmatory factor analysis of the 1972 ANES data derived three factors (economic, social, and racial), controlling for age, race, and socioeconomic status. Kerlinger's (1980) confirmatory factor analysis obtained two second-order factors of liberalism and conservatism, and, in seven of eight samples examined, found that a two-factor model yielded stronger results than did a single-dimension model.

Multidimensional results generally are consistent with theoretical expectations regarding attitude structure. For example, Lipset (1981) argued in favor of the presence of separate, but negatively correlated, economic and civil rights ideological dimensions, as a function of socioeconomic stratification. Rokeach (1973) proposed a two-dimensional model, involving freedom and equality. Kerlinger's (1967, 1972, 1984) criterial referents theory of social attitudes posits middle-level attitudinal categories, such as traditional conservatism (toward discipline, duty, and authority) and social welfare (toward socialized medicine, price controls, and labor unions), and two nearly uncorrelated higher-order dimensions of liberalism and conservatism. The absence in Kerlinger's results of strongly negative correlations between conservative attitude topics (religiosity, economic conservatism, traditional conservatism, and morality) and liberal attitude topics (sexual freedom/women's equality, social and economic equality, and social welfare) contradicts what should be observed if there were a single unidimensional, bipolar model of attitude structure (Fleishman, 1988, p. 162). In contrast, Judd and Mulburn's (1980) confirmatory factor analysis suggested that a single latent construct subsumed five issues, and Judd and Krosnick (1982) derived one second-order liberal/conservative dimension from five first-order factors.

In a general summary of much of the research on the dimensionality of attitude structure, Fleishman (1988, p. 162) notes:

> ...At least four viewpoints can be distinguished. According to the traditional viewpoint, political and social attitudes are unidimensional, ranging from liberal at one pole to conservative at the other. On the other hand, Converse (1964) suggested a basic absence of attitude organization, with the exception that vivid, concrete objects can organize subsets of attitudes. Kerlinger and Lipset both proposed a bidimensional structure. Whereas Kerlinger argued that the two dimensions of liberalism and conservatism are orthogonal, Lipset suggested that the two dimensions of government welfare programs and civil rights are negatively correlated.

Fleishman's (1988) own findings suggest the presence of twelve first-order factors: (1) government aid; (2) economic conservatism; (3) welfare spending; (4) urban spending; (5) sexual mores; (6) medical reasons for having an abortion; (7) social reasons, such as previous family size, for having an abortion; (8) racial discrimination; (9) defense; (10) free speech for atheists; (11) free speech for communists; and (12) free speech for homosexuals. Two second-order factors were derived: economic welfare, comprising the first four of the first-order factors; and individual liberty, which consists of the remaining eight first-order factors.

The Data.

We have chosen to use data from the composite General Social Survey (GSS) (Davis and Smith, 1992), rather than American National Election Study (ANES) or other data, for several reasons. First, GSS data are fully as representative as ANES data of noninstitutionalized, English-speaking adults 18 and over residing in the continental United States. Second, the number of respondents in the cumulative GSS data set is very large (over 27,000, for the 1971-1991 time series), thereby allowing a substantially more detailed analysis than might be possible for most other data sets. Third, the GSS data include a much wider array of political and social issues over an extended range of time than would be available from a comparable investigation of cumulative ANES data, thus permitting stronger tests of the dimensionality of attitude structure and changes in that structure.

In contrast to Fleishman's (1988) very wide-ranging inclusion of political and social attitude referents, we have more selectively drawn from the cumulative GSS pool of variables. Our goal is longitudinal, that is, to track changes over time, from the 1970s to the late 1980s, in attitude structure, rather than to examine in detail the nature of attitudes for any single year's worth of survey data. (Fleishman, for example, analyzed data in depth only from the 1984 GSS, with a less thorough supplementary study of the 1982 data). We have chosen to concentrate on attitudinal variables focused on lifestyle issues, such as abortion, homosexuality, pornography, and matters of religiosity. Attitudinal questions on other policy matters, including particularly economics and race, have been incorporated into the analysis, to provide a more global assessment of the degree to which "culture wars" issues constitute one or more distinctive constellations within the political firmament.

Findings from Factor Analysis.

An initial pass through the GSS data for 1976, 1980, 1984, and 1988 was made, making use of approximately 120 prospective indicators of "cultural" dimensions of attitude formation among the mass public. Many of those initial indicators did not load at an acceptable level (of .40 or greater) on one or more of the preliminary principal components derived for each year. Such variables were deleted from subsequent statistical analysis. Different sets of the remaining items loaded at the .40 level or greater on varying factors for each year. The relevant loadings, and factor locations, resulting from this initial analysis are presented in Table 1. Explanations of the variable labels are supplied in the Appendix. In this and all subsequent phases of statistical analysis, all variables have been standardized.

[Table 1 about here]

A few of the variables in Table 1 load ambiguously on more than one factor, using the unrotated loadings that are reported there. The number of derived factors varies somewhat from one year to another, and individual items load differently on those factors, but major elements of commonality are apparent. In particular, there is a consistent pattern of similar items loading on what could be called a "tolerance" dimension (Factor 1 for each year), subsuming acceptance of atheists, racists, communists, militarists, homosexuals, and certain elements of racial relationships and abortion attitudes. It is also worthy of note that abortion attitudes consistently fall along two distinctive, different dimensions, one focused on lifestyle choices (ABNOMORE, ABPOOR, and ABSINGLE) and the other focused on abortion as a rectification for problems not within the control of the prospective mother (ABDEFECT, ABHLTH, and ABRAPE). However, three of the abortion attitude measures load strongly on both dimensions.

Among other interesting findings from Table 1, it is also noteworthy that the connection (through the common Factor 1) of general tolerance items and attitudes toward general sexual conduct (XMARSEX, HOMOSEX, PORNMORL, and PORNRAPE) disappears in 1988; in fact, two of these items (XMARSEX and PORNMORL) disappear altogether from the loadings for 1988, and the two remaining sexual conduct measures that survive in 1988 are split between two different factors. It is also important to note that religious fundamentalism in adulthood (FUND) and recalled pre-adult fundamentalist

proclivities (FUND16) lay on a common factor (Factor 11) in both 1980 and 1988, but did not load at acceptable levels in either 1976 or 1984. In the subsequent regression analysis, then, fundamentalism is dealt with in statistical models for 1980 and 1988 as a composite factor; in models for 1976 and 1984, in contrast, fundamentalism is treated as a single-item variable, FUND.

Recognizing that different subsets of "cultural war"-related items were apparent from the preliminary principal components extraction of factors, a second-stage analysis was performed, using, for each year, only those items which had attained loadings of .40 or greater as shown in Table 1. The second-stage analysis employed maximum likelihood extraction of factors, followed by promax oblique rotation. This choice of methods has two consequences. First, maximum likelihood generally is preferable as a method for extracting factors. As compared to other alternative extraction methods, maximum likelihood extraction has desirable asymptotic properties and gives better estimates than other methods in large samples (Lawley and Maxwell, 1971; Bickel and Doksum, 1977). Also, maximum likelihood factor analysis does not require the assumption of multivariate normality, because it is equivalent of Rao's (1955) canonical factor solution and Howe's solution maximizing the determinant of the partial correlation matrix (Morrison, 1976).

Second, promax rotation is an oblique method for rotating initially extracted factors. This means that the resulting clusters of items, with loadings as shown in Table 2, are mutually intercorrelated, rather than statistically independent as would have been the case with an orthogonal rotation scheme (e.g., varimax). Oblique rotations often produce more useful patterns than do orthogonal rotations. However, a consequence of correlated factors is that there is no single unambiguous measure of the importance of a factor in explaining a variable. For this reason, it is common with oblique rotations to examine not only the pattern matrix of rotated factor scores, but also the reference structure of semipartial correlations adjusting for other factors and the factor structure of correlations ignoring other factors. Proportions of variance explained by each factor are shown for the weighted items.

[Tables 2a, 2b, 2c, and 2d about here]

The results presented in Table 2 may be summarized most usefully by defining the factors derived from the variables selected for each year, and searching for evidence of changes in such patterns. For 1976, as shown in Table 2a, Factor 1 constitutes a general tolerance dimension; Factor 2 incorporates all the abortion items; Factor 3 is perhaps best characterized as a general lifestyle dimension, concentrating on sexual conduct issues but also including marijuana use; Factor 4 represents life satisfaction; Factor 5 clearly addresses gun ownership; Factor 6 is primarily about tolerance for the teaching of unpopular views; Factor 7 subsumes free speech concerns; Factor 8 measures perceptions of racial propinquity; Factor 9 pertains to attitudes toward militarism; and Factor 10 deals narrowly with tolerance for homosexuals teaching in college. Of these, the strongest summaries of attitudes across all the relevant variables, as measured by the percentage of explained variance eliminating other factors, are Factors 2 (abortion), 1 (general tolerance), and 5 (gun ownership). In all, five different dimensions (Factors 1, 6, 7, 9, and 10) deal with various aspects of tolerance for unpopular views.

From Table 2b, it may be concluded that the ten factors produced for 1980 are as follows: Factor 1 is again a general tolerance dimension; Factor 2 is a general satisfaction dimension, like the corresponding Factor 4 in 1976; Factor 3 is a broader measure of gun ownership than the parallel Factor 5 in 1976; Factor 4 subsumes abortion attitudes centered around family structure; Factor 5 closely mirrors the corresponding Factor 3 from 1976 as a general lifestyle dimension; Factor 6 is a separate dimension of attitudes toward abortion, conditioned by considerations beyond the control of the pregnant woman; Factor 7 addresses confidence in governmental institutions and (far less strongly) business; Factor 8 subsumes current and preadult predilections toward religious fundamentalism; Factor 9 is essentially identical to Factor 7 in 1976, as a measure of tolerance for teaching unpopular views; and Factor 10 concerns tolerance for rights of homosexuals. Unlike the results for 1976, in 1980 there are three (as opposed to five) factors measuring aspects of tolerance toward disfavored groups, and a clearer focus on homosexuals' rights emerges. Furthermore, abortion attitudes are now bifurcated, a new institutional confidence dimension emerges, gun ownership becomes a more distinct and more broadly based dimension, and a distinctive fundamentalism dimension is evident. Separate dimensions that were apparent in 1976, on racial propinquity and militarism, disappear. Of the dimensions emerging in 1980, as measured by semipartial correlations, the strongest are gun ownership (Factor 3) and general tolerance (Factor 1).

In 1984, as summarized in Table 2c, a smaller number of attitudinal dimensions form than had been true in either 1976 or 1980. Factor 1, again, is a general tolerance dimension; Factor 2 mirrors Factor 4 from 1980, as a set of family structure-related attitudes toward abortion; Factor 3 is a general lifestyle dimension, but is focused more sharply on matters of pornography; Factor 4 is a general composite of life satisfaction variables; Factor 5, like Factor 6 in 1980, addresses circumstances beyond the control of the woman in abortion decisions; Factor 6 subsumes the gun ownership issues; Factor 7 is somewhat ambiguous, but is focused on tolerance for teaching racist values and much more weakly incorporates teaching by atheists and militarists; and Factor 8 continues the pattern established by Factor 10 in 1980 as a composite measure of homosexuals' rights. What makes the attitude structure of 1984 different from that of either 1976 or 1980 is principally is reduced dimensionality. What seems to have been lost in 1984, compared against 1980, is a general lifestyle dimension (which shifts more toward concern with the effects of pornography), as well as a separate confidence in institutions factor and a separate fundamentalism dimension. Of the eight factors

present in 1984, the strongest, as assessment by semipartial correlations, were family-structure attitudes toward abortion (Factor 2) and general tolerance (Factor 1). The essential changes in this pattern of strongest factors, compared to both 1976 and 1980, are the emergence of family structure-related abortion items as a singular concern and the disappearance of the gun ownership dimension.

Table 2d demonstrates the distribution of cultural variables for 1988. As in 1984, eight dimensions, rather than the ten dimensions in 1976 and 1980, are required to span the sample space. This provides some confirmatory evidence of reduced complexity over time in the distribution of attitude dimensions related to the "culture wars." For 1988, Factor 1 is, once again, a general tolerance dimension; Factor 2 deals essentially with tolerance of homosexuals' rights, but also incorporates (less strongly) elements of racial stereotyping (RACMAR, RACSEG); Factor 3 is the now-familiar set of family-structure attitudes toward abortion; Factor 4 clearly addresses matters of gun ownership; Factor 5 subsumes perceptions regarding abortion that are driven by conditions beyond control of the woman; Factor 6, as with Factor 8 in 1980, reflects fundamentalist tendencies in adulthood and adolescence; Factor 7 most strongly emphasizes views of the right of racists to teach in college, but also addresses (although much more weakly) free-speech rights of racists and the rights of atheists and militarists to teach college, much like Factor 7 for 1984; finally, Factor 8 is a general satisfaction dimension. As measured by semipartial correlations, the strongest factors in 1988 are fundamentalism (Factor 6) and gun ownership (Factor 4). What is perhaps most striking about the results for 1988 is the emergence of a separate fundamentalism dimension as the single strongest summary of overall cultural attitudes.

The "Culture Wars" Factors as Predictors and as Outcomes.

Of what consequence in American society and politics are these various and changing attitudinal dimensions that are associated with the "culture wars"? In the following analysis, we hypothesize a path analysis-like structure of equations in which we treat these factors (and other traits) as predictors of a major facet of political attitude formation--partisan identification--and then assess the predictors of the derived common factors. In this phase of the paper, our goal is to locate the role of the derived culture wars dimensions in the contemporary political universe of the United States.

The comparison of these cultural factors and other variables as predictors of partisan identification is summarized in Table 3. Variable labels are explained in the Appendix. The results of that analysis are shown for each of the four years--1976, 1980, 1984, and 1988--in hierarchical fashion for: (1) the full model, including both cultural dimensions relevant to each year and a common set of alternative predictors; (2) a reduced model containing only the culture wars dimensions as predictors; and (3) another reduced model incorporating as predictors all variables except the cultural dimensions. In this manner, we can evaluate the marginal and singular contributions of both sets of predictors. Factors 9 and 10 do not exist for 1984 and 1988, and so are omitted from the models for those years. The variable for adult fundamentalist tendencies (FUND) is included with the additional predictors for 1980 and 1988 because it did not load at an acceptable level in the first-stage principal components analyses for those years.

[Table 3 about here]

The most meaningful overall appraisal of Table 3 perhaps is provided by comparing the R-square values from each of the three sets of ordinary least squares regressions. Of the results for each of the four years, the models perform best (albeit not very well) in 1988. There is a somewhat quadratic upward trend in explanatory power over time for the full-model regressions and for the regressions utilizing non cultural factors. There is also a very modest, but more linear, upward trend in explanatory power for the cultural-factors-only reduced equations. Very clearly, the degree of predictive validity afforded by the cultural factors alone is very meager, explaining no better than five percent of total variation in party affiliation. Furthermore, there is virtually no increment in explanatory power for the full models, which include the cultural wars variables, beyond what can be explained by the other predictors. These patterns may also be seen in the model F values, which are larger for models with more predictive power relative to the number of predictor-variable degrees of freedom required to attain a given level of explained variance.

It is notable, however, that some of the cultural factors are statistically significant predictors. This is particularly the case when the effects of the other variables are removed. For the reduced models using only the "culture wars" composites as predictors of partisanship, the following pattern emerges. In 1976, the most significant factor was Factor 4 (life satisfaction), followed by Factor 7 (free speech), and, more marginally significant, Factors 2 (the omnibus abortion dimension) and 3 (sexual conduct and marijuana). The most highly significant composite predictors in 1980 were Factors 7 (confidence in institutions) and 8 (fundamentalism), followed by Factor 2 (satisfaction), and, more weakly, Factors 1 (general tolerance) and 10 (homosexual rights). For 1984, the predominant composite predictors were Factors 1 (general tolerance), 3 (lifestyle concerns, emphasizing pornography), and 4 (life satisfaction). In 1988, the predominant dimension was Factor 8 (life satisfaction), followed by Factor 6 (fundamentalism), and, more weakly, Factors 1 (general tolerance) and 3 (family structure-based attitudes toward abortion). It is also important to note that, among the other predictors, the separate variables measuring adult fundamentalist predilections are significant for the years (1976 and 1984) that this item does not load on a cultural dimension. In this sense, fundamentalism, as either part of a composite variable or as a separate measure, always is

a significant predictor of partisanship. Of the non-factor predictors, the most consistently and strongly significant predictors of party identification are, approximately in the following order, race, region (SOUTH), self-identified ideology (POLVIEWS), social class, and both Protestant and Jewish religious affiliation.

The remaining portion of the path analysis treats the separate "cultural wars" factors for each year as dependent upon the set of other predictors, which are taken to be exogenous to the relevant equations. The results of these models are summarized in Table 4. In general, compared against the findings summarized in Table 3, the attitudinal constructs contained in the factors for each year are predicted with greater success than those same factors were able to predict variation in partisanship. There is, however, an enormous range in predictive validity for the models shown in Table 4, with values of R-square as low as .04 and as high as .41.

[Tables 4a, 4b, 4c, and 4d about here]

Many of the predictors employed in the regression results shown in Table 4 are significant indicators of "cultural wars" constructs. Measured by the relative frequency and the level of confidence with which each variable is significant across the years that are studied here, the ten most regularly important predictors of our derived attitudinal dimensions are, roughly in descending order: intensity of religious preference (INTENSTY), educational attainment (EDUC), political ideology (POLVIEWS), family income (REALINC), size of place in which a respondent lives (XNORCSIZ), Protestant denominational affiliation (PROT), respondents' age (AGE), Catholic denominational affiliation (CATH), respondents' race (RACE), and degree of fundamentalism of respondents' religion (FUND) for the two years for which it is included as a separate predictor and not incorporated into one of the attitudinal dimensions. Jewish affiliation, in contrast to both Protestant and Catholic denominational attachments, is much less commonly significant. Signs on the significant predictors are generally in the expected direction.

There is an intriguing pattern of generally lower R-squared values over time in the results presented in Table 4. This pattern is reinforced by a diminishing proportion of significant predictors, and even more clearly by a reduction in the level of confidence with which it can be concluded that the predictors are significant. This finding seems to be consistent with what would be expected from arguments of secular dealignment, and appear to be indicative of a political system which is losing its continuity and predictability as new forces, such as evangelical or fundamentalist elements, enter into the arena and bring with them a different sense of how the game is to be played and for what purposes it is played.

Do our data show that fundamentalists, however defined, are indeed on the increase within the American body politic? Some important evidence on this score is provided in Table 5, which summarizes the relative frequency distributions from 1976 to 1988 for six variables: partisan attachment (PARTYID), the degree of fundamentalism of respondents' religious predilections (FUND), frequency of attendance at religious services (ATTEND), intensity with which religious preferences are held (INTENSTY), degree of fundamentalism present in respondents' upbringing (FUND16), and religious denomination (RELIG).

[Table 5 about here]

Based on the GSS data, over this time, party affiliations were characterized by modest but nearly monotonic change in favor of the Republican party. Similarly, there is a monotonic and noticeable increase in attachments to fundamentalist religious attachments, from 28.8% in 1976 to 35.4% in 1988. However, that pattern was nearly counterbalanced by a somewhat less marked, and decidedly less regular, growth in the proportion of respondents with attachments to liberal religious proclivities. There is a pronounced and steady fall in the proportion who were identified with moderate religious attachments. Although there does seem to be some confirmatory evidence in these results for the reputed mobilization of fundamentalist strength, that trend is partially offset by a growth in liberal religious attachments that would have to be assumed to be contrary to the fundamentalist upsurge on policy and doctrinal grounds. However, it should be noted that the proportion with fundamentalist inclinations always is substantially greater than the proportion with liberal tendencies. Of even greater relevance for the political and policy implications of changing religious inclinations, the proportions of fundamentalists and moderates were nearly equal in 1988, with the proportion of liberals far behind each of the other two categories. Very comparable results are evident for self-reports of religious upbringing (FUND16). These data clearly are suggestive of a pattern of increased polarization along religious attitude structures, as the proportion of moderates has declined over time.

Patterns of attendance at religious services shown in Table 5 are not very clear. The average rate of attendance seems to have increased between 1976 and 1984, but to have declined again in 1988. A rather comparable pattern is demonstrated for the intensity of religious beliefs, which became on average much stronger between 1980 and 1984, but then returned virtually to 1976 levels in 1988. Finally, general denominational affiliations have remained generally quite steady from 1976 to 1988. Certainly, the distributions for the RELIG variable over time do not suggest that any changes in attitudinal patterns that we have discussed could be explained simply by net changes in the denominational distribution. In fact, the data suggest that the Protestant denomination, which is the aggregate grouping that is most clearly associated in much of the relevant literature with a greater propensity for religious fundamentalism and political conservatism, may have suffered a modest net loss of its proportionate strength in 1988 over earlier years.

Discussion.

Mass beliefs undoubtedly will play a major role in defining the success or failure of the forces locked in combat in the battle over defining American cultural norms. A number of important questions can be raised as this "cultural war" continues to unfold: (1) Is there a definable "morality-oriented" population in the United States? (2) How large is this group? (3) Is this group cohesive on a multitude of cultural issues, or does it coalesce only around specific concerns? (4) Have attitudes toward morality changed appreciably within the mass public in recent years, and, if so, what manifestations of such a change are evident?

To a large extent, questions of size, cohesiveness, and longitudinal trends are purely empirical propositions. Evidence of the scope, stability, and longitudinal dimensions of carefully selected attitudinal variables can be quite helpful in making inferences about future directions in the current "culture war." This paper has explored attitudinal data in an effort to explicate the evidence regarding evolution of the American kulturkampf. Mass attitudes compiled over time by the National Opinion Research Center (NORC) are particularly useful in the effort to provide answers to some of these questions.

Our findings generally are consistent with the conclusion that our derived "culture wars" attitude clusters are comparatively much less important to the determination of partisan identification than are more traditional socio-demographic measures. However, religious fundamentalism was a significant predictor of partisanship in each year. The prediction of these cultural dimensions was far more successful. In that set of equations, the intensity with which respondents reported holding religious views played a major role, together with levels of educational attainment, Protestant and Catholic denominational affiliations, and a number of other explanatory variables.

Are the "culture wars" real? Yes, based on our examination of General Social Survey data over the time span of 1976-1988 using a wide array of potential indicators of that conflict. Yet, our findings are conditioned heavily by the unavailability of certain relevant variables on a regular basis over time regarding religious practices, women's rights, and other matters that clearly are related to the concept of "culture wars."

Do "culture wars" considerations play a major role in the processes of attitude formation within the United States? Again, the answer is "yes." However, the complexities of the interplay among the various "culture wars" attitudinal dimensions, and the relationships of those dimensions with other, primarily socio-demographic, variables, as well as with religious denomination, the intensity with which religious views are held, and such overtly political manifestations as partisanship or voting behavior, require further study. A potentially profitable framework with which to guide that future research is suggested by the results and procedures employed here.

In particular, the following considerations seem worthy of further research. First, the political, and cultural, implications of the evident polarization of the American mass public into increasingly robust "fundamentalist" and "liberal" camps seems of signal importance. Second, the fact that this evident polarization has occurred at a time of relative stability in the denominational mix of American religious preferences makes it fairly apparent that we are dealing with a real shift, or diversity, of values, and not merely an artifactual shift of denominational label. Third, the political relevance of the GSS variable measuring the intensity of religious commitment is crucial, as its prominent role as a predictor of cultural dimensions strongly denotes the importance of "depth of commitment" over and above the usual distinction among fundamentalist, moderate, and liberal persuasions. Fourth, the general inability of our models to predict party identification successfully as a function of derived cultural dimensions deserves further development. This may reflect a dealignment phenomenon, or it may, more simply, reflect the diversity of relatively more "liberal" and relatively more "fundamentalist" views within both of the major parties.

Finally, the wide disparity in the ability of our models to predict individual-level variation in scores on the derived cultural dimensions, despite the persistent statistical significance of certain predictors, demonstrates at a minimum that there are vastly different stories to be written about the different components of the "culture wars." The best predictions, reflecting R-square values of .30 or above, were for Factors 1 (general tolerance) and 3 (general lifestyle) in 1976, Factors 1 (general tolerance), 5 (general lifestyle), and 8 (fundamentalism) in 1980, Factors 1 (general tolerance) and 3 (general lifestyle) in 1984, and only Factor 6 (fundamentalism) in 1988. These results have in common the finding that the best predictions are obtained, fairly consistently, for general tolerance and lifestyle, and for fundamentalism (when it does not load onto one of the derived factors). However, the inability by 1988 to produce strong models for predicting general tolerance (and, to a lesser degree, also general lifestyle) suggests that a major change may be underway in the relationship between culturally-driven attitudes and the usual predictors of political cognition and behavior. This may imply that alternative predictors are needed, or it may imply that major changes are underway in the interplay among society, culture, and politics in the United States at the turn of the millennium. Further research along these, and related, lines clearly is in order.

Notes: Sample sizes and percentages are based on non-missing observations.

Definitions for the variables FUND, ATTEND, INTENSTY, and FUND16 are provided in the Appendix. PARTYID was coded in response to the question: "Generally speaking, do you usually think of yourself as a Republican, Democrat, Independent, or what?" RELIG was coded in response to the question: "What is your religious preference? Is it Protestant, Catholic, Jewish, some other religion, or no religion?"

Appendix: Variable Definitions and Codings

Cultural Variables

NATCRIME We are faced with many problems in this country, none of which can be solved easily or inexpensively. I'm going to name some of these problems, and for each one I'd like you to tell me whether you think we're spending too much money on it, too little money, or about the right amount. Are we spending too much, too little, or about the right amount on halting the rising crime rate? Too little=1; about right=2; too much=3.

NATDRUG ...Are we spending too much, too little, or about the right amount on dealing with drug addiction?
Too little=1; about right=2; too much=3.

NATRACE ...Are we spending too much, too little, or about the right amount on improving the conditions of Blacks?
Too little=1; about right=2; too much=3.

SPKATH There are always some people whose ideas are considered bad or dangerous by other people. For instance, somebody who is against all churches and religion.... If such a person wanted to make a speech in your (city/town/ community) against churches and religion, should he be allowed to speak, or not?
Yes, allowed to speak=1; not allowed=2.

COLATH ...Should such a person be allowed to teach in a college or university, or not?
Yes, allowed to teach=4; not allowed=5.

LIBATH ...If some people in your community suggested that a book he wrote against churches and religion should be taken out of your public library, would you favor removing the book, or not?
Favor=1; not favor=2.

SPKRAC ...Or consider a person who believes that Blacks are genetically inferior. If such a person wanted to make a speech in your community claiming that Blacks are inferior, should he be allowed to speak, or not?
Yes, allowed to speak=1; not allowed=2.

COLRAC ...Should such a person be allowed to teach in a college or university, or not?
Yes, allowed to teach=4; not allowed=5.

LIBRAC ...If some people in your community suggested that a book he wrote which said Blacks are inferior should be taken out of your public library, would you favor removing this book, or not?
Favor=1; not favor=2.

SPKCOM ...Now, I should like to ask you some questions about a man who admits he is a Communist. Suppose this admitted Communist wanted to make a speech in your community. Should he be allowed to speak, or not?
Yes, allowed to speak=1; not allowed=2.

COLCOM ...Suppose he is teaching in a college. Should he be fired, or not?
Yes, fired=4; not fired=5.

LIBCOM ...Suppose he wrote a book which is in your public library. Somebody in your community suggests that the book should be removed from the library. Would you favor removing it, or not?
Favor=1; not favor=2.

SPKMIL ...Consider a person who advocates doing away with elections and letting the military run the country. If such a person wanted to make a speech in your community, should he be allowed to speak, or not?
Yes, allowed to speak=1; not allowed=2.

COLMIL ...Should such a person be allowed to teach in a college or university, or not?
Yes, allowed to teach=4; not allowed=5.

LIBMIL ...Suppose he wrote a book advocating doing away with elections and letting the military run the country. Somebody in your community suggests that the book be removed from the public library. Would you favor removing it, or not?
Favor=1; not favor=2.

SKPHOMO ...And what about a man who admits that he is a homosexual? Suppose this admitted homosexual wanted to make a speech in your community. Should he be allowed to speak, or not?
Yes, allowed to speak=1; not allowed=2.

COLHOMO ...Should such a person be allowed to teach in a college or university, or not?
Yes, allowed to teach=4; not allowed=5.

LIBHOMO ...If some people in your community suggested that a book he wrote in favor of homosexuality should be taken out of your public library, would you favor removing this book, or not?
Favor=1; not favor=2.

GRASS Do you think the use of marijuana should be made legal or not?
Should=1; should not=2.

FUND Fundamentalism/liberalism of respondent's religion.
Fundamentalist=1; moderate=2; liberal=3.

ATTEND How often do you attend religious services?
Never=0; less than once a year=1; about once or twice a year=2; several times a year=3; about once a month=4; 2-3 times a month=5; nearly every week=6; every week=7; several times a week=8.

FUND16
Fundamentalism/liberalism of religion respondent raised in.
Fundamentalist=1; moderate=2; liberal=3.

RACMAR Do you think there should be laws against marriages between (Negroes/ Blacks) and whites?
Yes=1; no=2.

RACSEG Here are some opinions other people have expressed in connection with (Negro/Black)-white relations. Which statement on the card comes closest to how you, yourself, feel?
White people have a right to keep (Negroes/Blacks) out of their neighborhoods if they want to, and (Negroes/Blacks) should respect that right.
Agree strongly=1; agree slightly=2; disagree slightly=3; disagree strongly=4.

RACCLOS Are there any (Negro/Black) families living close to you?
Yes=1; no=2.

RACDIS How many blocks (or miles) away do they (the [Negro/Black] families who live closest to you) live?
On this block, a few doors/houses away=1; 1-3 blocks away, under 1/4 mile=2; 4-8 blocks away, 1-4 to 1 mile=3; over 8 blocks away, over 1 mile=4.

HAPPY Taken all together, how would you say things are these days--would you say that you are very happy, pretty happy, or not too happy?
Very happy=1; pretty happy=2; not too happy=3.

LIFE In general, do you find life exciting, pretty routine, or dull?
Exciting=1; routine=2; dull=3.

HELPFUL Would you say that most of the time people try to be helpful, or that they are mostly just looking out for themselves?
Try to be helpful=1; just look out for themselves=2.

TRUST Generally speaking, would you say that most people can be trusted or that you can't be too careful in dealing with people?
Most people can be trusted=1; can't be too careful=2.

SATCITY For each area of life I am going to name, tell me the number that shows how much satisfaction you get from that area.
The city or place you live in.
A very great deal=1; a great deal=2; quite a bit=3; a fair amount=4; some=5; a little=6; none=7.

SATHOBBY ...Your non-working activities--hobbies and so on.
A very great deal=1; a great deal=2; quite a bit=3; a fair amount=4; some=5; a little=6; none=7.

SATFAM ...Your family life.
A very great deal=1; a great deal=2; quite a bit=3; a fair amount=4; some=5; a little=6; none=7.

SATFRND ...Your friendships.
A very great deal=1; a great deal=2; quite a bit=3; a fair amount=4; some=5; a little=6; none=7.

SATHEALT ...Your health and physical condition.
A very great deal=1; a great deal=2; quite a bit=3; a fair amount=4; some=5; a little=6; none=7.

CONBUS I am going to name some institutions in this country. As far as the people running those institutions are concerned, would you say you have a great deal of confidence, only some confidence, or hardly any confidence at all in them? Major companies.
A great deal=1; only some=2; hardly any=3.

CONFED ...Executive branch of the federal government.
A great deal=1; only some=2; hardly any=3.

CONTV ...TV
A great deal=1; only some=2; hardly any=3.

CONJUDGE ...U.S. Supreme Court
A great deal=1; only some=2; hardly any=3.

CONLEGIS ...Congress
A great deal=1; only some=2; hardly any=3.

ANOMIA5 In spite of what some people say, the lot (situation/condition) of the average man is getting worse, not better.
Agree=1; disagree=2; don't know=3.

ANOMIA6 It's hardly fair to bring a child into the world with the way things look for the future.
Agree=1; disagree=2.

JOBINC Would you please look at this card and tell me which one thing on this list you would most prefer in a job? Which comes next? Which is third most important? Which is fourth most important?
Most=1; next=2; third=3; fourth=4; fifth=5.

JOBHOUR ...Working hours are short, lots of free time.
Most=1; next=2; third=3; fourth=4; fifth=5.

JOBMEANS ...Work important and gives a feeling of accomplishment
Most=1; next=2; third=3; fourth=4; fifth=5.

SATFIN We are interested in how people are getting along financially these days. So far as you and your family are concerned, would you say that you are pretty well satisfied with your present financial situation, more or less satisfied, or not satisfied at all?
Pretty well satisfied=1; more or less satisfied=2; not satisfied at all=3.

FINRELA Compared with American families in general, would you say your family income is far below average, below average, average, above average, or far above average? (Probe: Just your best guess).
Far below average=1; below average=2; average=3; above average=4; far above average=5.

ABDEFECT Please tell me whether or not you think it should be possible for a pregnant woman to obtain a legal abortion if...
If there is a strong chance of serious defect in the baby?
Yes=1; no=2.

ABNOMORE ...If she is a married and does not want any more children?
Yes=1; no=2.

ABHLTH ...If the woman's own health is seriously endangered by the pregnancy?
Yes=1; no=2.

ABPOOR ...If the family has a very low income and cannot afford any more children?
Yes=1; no=2.

ABRAPE ...If she became pregnant as a result of rape?
Yes=1; no=2.

ABSINGLE ...If she is not married any does not want to marry the man?
Yes=1; no=2.

XMARSEX What is your opinion about a married person having sexual relations with someone other than the marriage partner--is it always wrong, almost always wrong, wrong only sometimes, or not wrong at all?
Always wrong=1; almost always wrong=2; wrong only sometimes=3; not wrong at all=4.

HOMOSEX What about sexual relations between two adults of the same sex--do you think it is always wrong, almost always wrong, wrong only sometimes, or not wrong at all?
Always wrong=1; almost always wrong=2; wrong only sometimes=3; not wrong at all=4.

PORNMORL The next questions are about pornography--books, movies, magazines, and photographs that show or describe sex activities. I'm going to read some opinions about the effects f looking at or reading such sexual materials. As I read each one, please tell me if you think sexual materials do or do not have that effect. Sexual materials lead to breakdown of morals.
Yes=1; no=2.

PORNRAPE ...Sexual materials lead people to commit rape.
Yes=1; no=2.

PORNLAW Which of these statements comes closest to your feelings about pornography laws?
There should be laws against the distribution of pornography whatever the age=1; there should be laws against the distribution of pornography to persons under 18=2; there should be no laws forbidding the distribution of pornography=3.

POLHITOK Are there any situations you can imagine in which you would approve of a policeman striking an adult male citizen?
Yes=1; no=2.

POLESCAP Would you approve of a policeman striking a citizen who was attempting to escape from custody?
Yes=1; no=2.

POLATTAK Would you approve of a policeman striking a citizen who was attacking the policeman with his fists?
Yes=1; no=2.

OWNGUN Do you happen to have in your home (or garage) any guns or revolvers?
Yes=1; no=2.

PISTOL (If Yes), is it a pistol?
Yes=1; no=2.

SHOTGUN (If Yes), was it a shotgun?
Yes=1; no=2.

RIFLE (If Yes), was it a rifle?
Yes=1; no=2.

Other Variables

PRESTIGE Prestige of respondent's occupation, based on the Hodge-Siegel-Rossi NORC scores. [Actual score is coded].

MARITAL Are you currently--married, widowed, divorced, separated, or have you never been married?
Currently married=1; not currently married=3.

CHILDS How many children have you ever had? Please count all that were born alive at any time (including any you had from a previous marriage). [Actual number of children is coded].

AGE Respondent's actual age, in years. [Actual number of years is coded].

EDUC Respondent's years of education. [Actual number of years, up to 20, is coded].

SEX Respondent's sex.
Male=1; female=0.

RACE Respondent's race.
White=1; nonwhite=0.

HOMPOP Number of household members. [Actual number of household members is coded].

SOUTH Region of interview.
South=1; nonsouth=0.

XNORCSIZ NORC size of place.
Within an SMSA and a large central city (over 250,000)=01; a medium-size central city (50,000 to 250,000)=02; a suburb of a large central city=03; a suburb of a medium-size central city=04; area of a large central city (division, township, etc.)=05; an unincorporated area of a medium central city=06; not within an SMSA, (within a county) and a small city (10,000 to 49,999)=07; a town or village (2,500 to 9,999)=08; an incorporated area less than 2,500 or an unincorporated area of 1,000 to 2,499=09; open country within larger civil division, e.g., township, division=10.

POLVIEWS We hear a lot of talk these days about liberals and conservatives. I'm going to show you a seven-point scale on which the political views that people might hold are arranged from extremely liberal--point 1--to extremely conservative--point 7. Where would you place yourself on this scale?
Extremely liberal=1; liberal=2; slightly liberal=3; moderate, middle of the road=4; slightly conservative=5; conservative=6; extremely conservative=7.

FUND [Defined as shown above. This variable was employed as a separate predictor for those years--1976 and 1984--in which FUND did not load on a cultural factor.]

INTENSTY Intensity of religious preference [recoded from the original RELITEN variable].
Strong=1; somewhat strong=2; not very strong=3.

CLASS If you were asked to use one of four names for your social class, which would you say you belong in: the lower class, the working class, the middle class, or the upper class?
Lower class=1; working class=2; middle class=3; upper class=4.

REALINC Family income in constant dollars (base=1989). [Actual dollar amounts are coded].

PROT Protestant and non-Protestant [recoded from the original RELIG variable].
Protestant=1; non-Protestant=0.

CATH Catholic and non-Catholic [recoded from the original RELIG variable].
Catholic=1; non-Catholic=0.

JEWISH Jewish and non-Jewish [recoded from the original RELIG variable].
Jewish=1; non-Jewish=0.

Reflections on the Chinese State and Society: A Thesis of Two Partial Selves

Reflections on the Chinese State and Society: A Thesis of Two Partial Selves

Abstract

Where is the boundary of the state is a question which concerns most comparative political scientists. Since in China studies, the state-and-society approach is also among one of the most popular perspectives, the students will have to face the issue. This paper presents a native Chinese perspective on the state-and-society approach. It is argued that the state and the society in China actually overlap. The paper examines the cultural and ideological bases of this symbiosis of the state and the society and illustrates the double-agent character of Chinese managers, workers and peasants. The paper contends that every Chinese mind set contains two partial selves, enacting the state role and the social role alternatively and allowing mutual penetration of the state and the society.

Reflections on the Chinese State and Society: A Thesis of Two Partial Selves

Introduction

The state-and-society approach has been one of the most popular modes of analysis in comparative politics. In China studies, for example, students are interested in if the Chinese communist state, established in 1949, has successfully penetrated the traditional Chinese society. The answers divide the field.[1] Some tend to see a relatively strong state in China. The state, for example, may utilize all sorts of clientelist relationships in the society and can thus effectively allocate social resources mostly as intended. In contrast, others may see the society develop its own style of operation under the new socialist regime. According to this view, the society has to a large extent prevented the state from interfering in its operation through the continuity of a tradition which stresses harmony and autonomy.

Whatever the truth, the state-and-society approach assumes that there are a distinctive set of structures called the state and another called the society and their strength is structurally stable in the long run. Whether or not the state can penetrate the society is a matter of the balance of the relative strength. In a way, this assumption is compatible with both the Hegelian and the Marxian perspective on contemporary politics. In the Marxian perspective, for example, politics today, above all politics in the West, reflects the capacity of the state to accommodate bourgeois interests. The essence of politics pertains

to if the state can remain autonomous under the pressure of the bourgeois class.[2] The assumption in the Marxian perspective has to be that, in each political system, there are structural forces which determine the extent to which the civil society penetrates the state. Since the concern focuses upon the structures, the relative strength of the state *vis á vis* the society must be taken as stable in the long run.

The assumption about structural stability in the state-and-society approach in the West makes sense to most analysts.[3] Therefore the debate between Marxists and non-Marxists mainly regards the degree of the state's autonomy.[4] In China, however, the assumption would face difficulties both because, in traditional philosophy, the Chinese think that the state structures must mimic the social structures and because the communist state theoretically employs every single citizen in the society. As a result, there is no such distinction between the state and the society that can be meaningfully made in the Chinese mind set. If Chinese politics is also treated as interaction between the state and the society, one natural question follows: who are those people that can serve to bring forth the structural forces of the state and who are those people serving the society? Namely, can one do research on the state-society interaction if agents of the state and agents of the society are not distinctively separate as two groups of people?

This paper discusses the state-and-society approach as applied to China from a native Chinese perspective. It is argued that the state-and-society interaction exists not between the two distinctive sets of structural forces, but within everyone's

mind. Ordinary Chinese citizens play dual roles. They are simultaneously agents of the state and of the society. To enact both roles, Chinese people are compelled to satisfy the state expectation and the social expectation alternatively. This practice produces inconsistent outlook which makes one confused about the phenomenon in which the society dominated the state in one period, the state regained control shortly after, then the society struck back, and so on. The quick reshuffling of balance of force between the state and the society does not match the Western expectation that the balance is, and should be, stable. In short, the state and the society in China overlap. This unique symbiosis may constrain the insight of the state-and-society approach as found in the analysis of the Western systems, but it may also shed light on the cyclical style in Chinese politics.

The State vs. the Society

Many have examined the nature of the Chinese state and society. Questions about the relative strength of the Chinese state appear in research on both the industrial and the agricultural sectors. For example, there is the argument that the authority in the Chinese work place establishes itself through a cliental system.[5] Workers can be broken down into two groups: one is very active and the other, passive. The more active ones seek promotion and other personal gains by performing well the state function along the assembly line as well on the political front. Normally, these loyal servants of the state depend on specific superiors to take good care of them. Accordingly, the policy making in the Chinese work place resembles neither the

Western style of pluralism which presupposes interest group formation, nor the traditional style of authoritarianism which rests entirely on private relationship.

In this view, one sees the Chinese policy making is organized around the state positions. Those in the state positions have enormous influence over the allocation of resource in the society. Those in the lower echelons who seek more benefit and welfare would have to prove their trainability and loyalty by performing the political assignment right and aggressively. If their performance assists their superior in winning popularity among his or her superior, they receive reward. This type of relationship naturally reinforces the political myth of the state and consolidates, in the public arena, the legitimacy of the state.

In contrast, there is the view that the Chinese work-place can in a sense transforms the state requirements and even distorts them in the protection of the interests of the enterprise or the factory in question. This is sometimes termed as "work unit socialism."[6] Chinese workers not only depend on their enterprises for their salary, other necessities, the most important of which include housing, marriage, retirement allowance, and so on, are all allocated through the enterprise system. Once assigned to an enterprise, workers usually expect to spend the rest of their life in the factory. It is more than natural that each enterprise would develop its own unique enterprise culture. Workers as well as cadres of the enterprise regard the collective gain of the enterprise and the distribution of the gain within the enterprise as the most essential issues

in their normal lives.

Work unit socialism stresses the importance of the internal pressure of an enterprise. Managers would have tremendous difficulties in managing their factories if general expectation of the workers regarding their legitimate share of the benefit is not met. Not only do general managers themselves have to spend a great deal of their life time in any specific factory but also their chance for promotion is contingent upon their ability to maintain harmony in the factory. Facing life-time workers in the factory who do not have to worry about losing their jobs, general managers cannot expect to satisfy these workers easily. As a result, consensus fetching becomes the style of decision making in the work unit. The perspective that work unit socialism portrays is therefore rather different from the picture given by the clientelist view. The work unit is itself a relatively autonomously developed community and its collective interests must first be met before general managers can successfully perform the state-assigned job.

Compared with research in the industrial sectors, there is a parallel pursuit by those who strive to theorize the state-society relationship in the Chinese agricultural sectors. The clientelist perspective finds its ally here.[7] It is argued, for example, village politics which affects resource allocation in the countryside mirrors politics in the industrial work place. Productive team leaders must maintain good terms with the state managers in order to evade some of the state request in terms of the quality of the grain or the amount of the tax in kind. Since the state arbitrarily decides how much the team would need for

survival, villagers are in such a vulnerable position that they are subject to the state pressure at their own sacrifice. This is why personal connections with the state agent are critical to the interests of villagers.

The state purchases and sells grain according to the state plan. The planning system ensures the position of the state as a controller in the agricultural sectors. Reform since the late 1970s which has installed the family responsibility system and the grain contracting system may ironically serve to reduce the state's influence and submit it to the locally arisen autocracy. This happens because, as villagers are allowed to keep and sell whatever amount produced over the contracted volume, they are able to generate surplus for themselves and thus no longer subject to the state's plan control. As new cliental pattern evolves, the state may gradually fade away and the society may re-emerge as an autonomous entity operating against the state apparatus just like it had existed before the communist regime came to power.

Opposite to the above view, the analogy of "honeycomb" describes villages under Chinese communism as rather autonomous components of local communities.[8] On the one hand, Maoism periodically encouraged the local community to depend on itself for all-round development. On the other hand, traditional values and ways of life survive the communist taking-over of the regime. As a result, local leaders always find ways to cheat the state and beat the system. It may appear that the state, as the center of power, constantly gives direction to local communities. In reality, those living in the periphery continue to pay loyalty

to traditional leaders some of whom now lead in the name of state cadre, but the game of local protectionism is the same as before. In short, the communist regime has failed to penetrate the traditional society which is organized like honeycombs and thus highly protective from external interference.

However, as reform brings in the notion and the practice of the market, the traditional community faces the threat of disintegration. It is contended that once villagers become free competitors in the market, they would no longer depend on local gentry for making a better living. This way, the state would gain better access to local, peripheral communities through policy that affects the operation of the market. While the clientelist perspective awes the state's extensive reach, the honeycomb approach questions the state's capability. While the clientelist perspective looks at reform as mechanism that may allow local autocracy to thrive at the expense of the state's capability, the honeycomb approach views reform as a possible tool to enable the state to eventually penetrate and modernize the society.

Is it possible that the two perhaps-too-generally-divided perspectives can be reconciled? Is it possible that the Chinese communist state has indeed successfully penetrated the society while, at the same time, the society is also successfully protective of its integrity in pursuing collective interests? If it appears unlikely that both are correct, let us imagine two blind men grabbing an elephant's ears and nose respectively, each trying to figure out how an elephant looks like. It would be extremely difficult to let them believe that they both give a correct picture of a part of the elephant, but they would be

wrong if they claim that their feelings represent the only true feeling. What perspectives, then, can allow mutual penetration of the state and the society? The following discussion presents the argument from a native Chinese point of view which, hopefully, can demonstrate how the Chinese mind set has allowed the state and the society in China to have overlapped and thus made possible the mutual penetration of the state and the society.

The Chinese Mind Set

Two broad themes keep the contemporary Chinese from making a clear distinction between the state and the society. One theme bears historical, social legacy and the other carries current state ideology. The first theme is all about Confucianism. In fact, Western scholarship has noted one unique aspect of Chinese politics, that is, the nature of politics in historical China was not a battle for more power, but a drama of role playing.[9] Those who could satisfy the ceremonial requirement and bring harmony to people's mind often won voluntary support from the subordinate. The Chinese leaders must appear selfless in order to reign and rule. A leader has to represent the collective and his selfless appearance is always essential to securing popular trust. This continues to be an element in contemporary Chinese political culture.[10]

Since role playing is such an important vehicle to political legitimacy, the sources of the role contents become critical in order to understand the Chinese mind set. According to the Confucian prescription, the state is an extended family, so it

should have a patriarchal head and the citizens are like children. Confucius himself once spread the image that all men under heaven were brothers. There is no need to detail the Confucian norms in this paper. The point is that if the state is perceived as an extended family, the state itself is, in the cognitive sense, the society. There is no generally different set of norms that would govern the running of the state.

While, in the structural sense, the state obviously had its own bureaucrats and one of its highest interest was necessarily survival like in all the other states, the Chinese state recruited loyal service from its citizens as if they had been providing service to their father. The bondage between the state and the society was psychological rather than physical and this is part of the myth of why a small state bureaucracy could reign such a mass of land for such a long period of time. The ethos of the Chinese political culture lies in the belief that the survival and thriving of the state are equivalent to the survival and the thriving of the family.

The Chinese case does not contain a typical feudal society. There was no caste system, nor was there legitimate blockade of social mobility. The ideal career pass was to serve the state. Positions in the state indicated higher social status and no other alternative could match the honor and the benefit that the state could offer to the family. In short, relatively loose control over social mobility together with the dominant social status in the state may have effectively reduced the perceptual sensitivity to the difference remained, if any, between the state and the society. The continuum from the society to the state has

been twofold: the conceptual linkage that treats the state as an extended family, and the social linkage that obliges the state employees to benefit their families.

A second theme consists in socialism. On the one hand, socialism denounces private property; on the other, it promotes central planning. In the orthodox Marxian sense, there should be no need of state under socialism. In the real world, it is said that the existence of the imperialist world made the fading away of the socialist state impractical.[11] Nonetheless, the socialist state is supposedly ruled by the proletarian class. At least within the Chinese state, there should be only one class, hence classless. A classless society operating under a central planning system composes of the state. In a pure case, the state is the society.

Nevertheless, there have been policy line struggles.[12] It may appear that the struggles parallel a battle between the pro-state vs. the pro-society factions. Those who identify socialism with central planning argue that, under socialism, products are priced according to the labor time accrued in the productive process. By this logic, the state can and should plan everyone's work to prevent exploitation.[13] In the name that all workers are the owners of the means of production, the state employs them all. As all workers in the society are state employees, the society and the state overlap. Like in the traditional society where state officials own nobility, those who work directly for the central planners, that is, the new state, enjoy higher social status and more benefits.

This development triggers those who identify socialism with

the masses, i.e. peasants and workers, to challenge the central planning system as an old practice which the 1949 revolution had intended to overthrow.[14] They see the system as the new exploitative state. Policies that revoke the extent of central planning vary in their outlook, ranging from Mao Zedong's cultural revolution to Deng Xiaoping's decentralization drive. The rationale is the same: to substitute the masses for the bureaucracy in allocating social resources. These people portray an image of corrupt and incompetent state and strive to strike it.

Further analysis would, however, suggest that neither line moves beyond the traditional the-society-in-the-state, or the-state-in-the-society logic. Both may actually reinforce the overlapping of the state and the society. The pro-state theme, for example, justifies itself by pretending that there is only one class in the society and this would entitle the planners to leadership. The pro-society argument denies the legitimacy of the other faction by accusing it of actually not being a part of the society. In other words, the legitimacy of the state, in terms of the party and bureaucracy, relies upon an image that the state is not an entity separate from the society.

Both the Confucian theme and the socialist theme obscure the perceptual distinction between the state and the society. The Confucian theme prepares a Chinese mind set that enables them to serve the state as if they were fulfilling their social obligation. The socialist theme installs a Chinese mind set that lead them to appreciate that there is no society outside the state. The state obviously penetrates the society since all

workers must work for the state and accept the state ideology. The society also penetrates the state since workers feel it legitimate to allocate resources in the name of the state to satisfy their personal needs. As state employees, workers by definition perform public function in supposedly private realms, rendering no room of privacy; as proletariats, workers own (by squandering) whatever the state claims, leaving the state a somewhat spurious organ.

In this sense, the struggle between the state and the society as structural imperatives become a struggle within each mind set. The planners may request a worker to work overtime without pay. This is legitimate if the planners are simply social leaders whose domain of influence is by definition all-encompassing, but questionable if the worker is a proletariat whose role is the master of the state apparatus. The family may ask illegal favor from a worker who is its member. This is fine if the worker acts as a social being, but problematic from the planners' point of view. The same sort of role conflict occurs everywhere in the world. In the Chinese case, however, all state structures can be at the same time regarded as social structures. The state can blame the society for its corrupt deeds as spiritual pollution while the society can accuse the state of engaging precisely the same deeds as betraying the proletarian class. It becomes a political as well as psychological struggle to determine how those involved should look at the situation.

The Chinese Socialist Practice

The overlap of the state and the society is clearer when

examining the behavior of their agents, those who act in the name of the state or the society, whichever selected. A few real-world examples may help illustrate the overlap of the state and the society in China.

The best position that dramatizes the state-society dilemma in China is probably "general manager." A general manager is responsible for the collective interests of his enterprise and also for the productive assignments given by the local planners. The Chinese planners are consciously aware of the contradiction involved in a general manager's job. According to a researcher of a municipal planning board, his colleagues have had an on-going debate about who the general manager "should" represent.[15] According to his observation, a few maintain that he represents the planners, others contend that he represents the enterprise, and still a small group argues that he represents himself as a professional.

A general manager of a highly profitable enterprise reveals his analysis in the following way.[16] He believes that he has to cooperate as well as resist the city bureau chief in order to achieve the maximum room for the enterprise to maneuver in the market. It is a game of manipulation. Here, he is an agent of the society. However, he also works extremely hard because he wants to leave something for his country before he retires in a couple of years. Now he is an agent of the state. He also brags about all kinds of tricks that he uses to beat the system so that he can give workers much more than the state permits. He is back to the society here. He praises socialism nonetheless which gives him an amount of resource more than he can personally gather and

thus allows him to make big contribution to his country. Again, he echoes the state interest.

Another manager looks for ways to reconcile the planner and the enterprise. He proposes that, in the first stage, the enterprise determines what is best for it to produce according to market information and the planners determine what the state needs according to the national interests. They do this separately and then see if their choices match. The enterprise can do well only if it produces those items that satisfy both sides. The same manager claims that he wishes to train all workers into devoted state employees, but he also knows that he must represent the enterprise to talk the planners into accepting the enterprise's own market analysis. He is an agent for the state and for the society as occasions vary.

Workers know the duality of their identity. They expect the general manager to protect the interest of the enterprise if the city bureau chief is incompetent. They understand that he cannot over protect them, however, for the state in any case owns the enterprise. Workers have to fight against spiritual pollution as the state agents, so they pay to watch patriotic films, read political texts, participate in learning sessions, etc. as required. Once off duty, many act against the state. They may have, for example, wondered around those on food strike and threw pieces of bread to show support during the 1989 pro-democracy movement. Workers are agents of the state and the society alternatively.

A village party secretary acknowledges that he must consider the village interests first because he has grown up in the

village. He maneuvers very hard in order to keep the most talented in the village for village development. He nonetheless has the responsibility of recruiting quality workers for the state enterprise which looks to him for new employees. In the same village, the head of the village makes several successful investments. He would rather use his own fund because he could have profited much more. He nonetheless uses the public fund in the village so that everyone can benefit at the same time. Public fund is a form of socialism, but he uses it to satisfy the traditional expectation of a peasant leader in addition to the expectation of a socialist productive team leader. Accordingly, the line that separates the state and the society exist in people's mind. When the pressure is on from both sides, those who occupy the right positions and have the power to allocate resources struggle inside. When the two sides converge, the force can be gigantic, though.

Even in the Chinese terminology, the notion of the state vs. the society is never refined. In most cases, the struggle is presented as one between the public and the private or between the collective and the departmental. In fact, neither the public nor the collective can literally be equivalent to the state. One difference between the collective and the state is that the state is always considered as the great self while the collective at the enterprise level is a lesser self. The state is the greatest public and, in a sense, that means the society. For example, the state in Chinese is read as "*guojia*," literally "state family."

The overlap of the state and the society at the micro-level has political implications. For the state to mobilize social

support, it must provide incentives for the micro-level agents to act in accordance with the state plan. The state has a psychological leverage because, morally, the state is the greatest self residing in the mind of the little self.[17] General managers and party secretaries shall persuade themselves into action that allocates resources according to the public interests embodied in the plan system. Moves against the policy which is given in the name of the great self thus become moves against oneself. General managers must struggle to justify to themselves why they can morally save fund for their enterprises without telling the planners the truth.

A second leverage the state enjoys is coercion.[18] However, one can hardly expect a public official coerces himself simply because actions he has taken for the sake of his personal gain violate the collective interests. Coercion can be useful, however, if it is used against someone else who acquires private gains at the expense of the collective interests. The overlap of the state and the society guarantees that there will be a great many more who may have engaged in similar selfish actions but will not be punished. Periodical coercion is necessary, though. The public who punishes the unfortunately selected few engages in a drama of punishing the public itself who conducts the same sin as those actually punished. The drama reminds those little selves who act in the name of the collective that there is a limit of the state's tolerance. As a psychological form of projection, general managers of the more profitable enterprises would thus support the suppression against spiritual pollution. In this way they shift attention away from their own sin and

forgive their own sin by helping reduce total sin in the system.

A third leverage the state has is to allow the little self in control of the collective resources.[19] Those work for the state legitimately resume their status as the agents of the society and utilize resources at hand to benefit themselves. Normally, they would not get rid of the state once and for all because their private gains are legitimate only when the state says so in the name of the public. Those who lose out in the market would also return to the state for rescue. In order to save the credit of the state which gives legitimacy to market reform, those who benefits from the market reform would naturally and willingly sacrifice short-run interests to help those lagged behind. Most general managers would be patient enough to wait for the next round of decentralization rather than risking his established status in the state by challenging the state directly. In any case, they themselves are the state.

Peaceful evolution or political revolution in China is unlikely under this context. Few would move against the so-called state since everyone is a part of it which, in turn, is a part of the society that includes everyone. Peaceful evolution and political revolution are unnecessary since the society has ulterior yet ubiquitous access to the state policy implementation process. Actions against the state make sense only if the target covers at most a small section of the state. To overthrow the state as a whole would be tantamount to deconstructing the society. What protect the Chinese state are therefore the physical symbiosis of the agents of the state and the society and the psychological symbiosis of the state and the society in the

Chinese mind set.

A Cyclical Pattern

Dazing political changes in China do not always indicate structural transformation in that changes are a built-in component in the Chinese state-society symbiosis. The Chinese mind set shifts back and forth quickly between those nominal state and society forces. People appear to have little difficulty in making political adjustments. Each political turmoil may lead to the outside speculation that there is a fundamental change in Chinese political system. Consistently, however, later development always resumes the supposedly transformed system.

The pro-state and the pro-society struggle has indeed shown itself in many different forms, sometimes as professional vs. red, at other times as central vs. local, and still other times as sectorial vs. provincial. In essence, it is state socialism vs. mass socialism. The first such struggle witnessed the purge of one central planner Gao Gang in 1954 by a group of peasant revolutionary leaders including Mao Zedong and Deng Xiaoping. In 1957, engineers were purged as rightists. Local peasant leaders began to enter industrial sectors, becoming general managers in the 1958 Great Leap Forward campaign. The provincial interests seemed triumphant. The plan sector struck back in the 1960s until the Cultural Revolution which started in 1966 effectively enforced the practice that only poor and lower-middle peasants were eligible for jobs in industrial sectors. The red had an upper hand.[20]

Development since 1976 demonstrates that any conclusion of

fundamental changes in China may be premature. The coup against the Gang of Four did not end political turmoil as one may have anticipated. The historical Third session of the Eleventh Plenary of the Communist Party brought no political unity as once thought. Deng Xiaoping and Hua Guofeng soon divided in public after the session. In 1982, reformers gave every observer new hope by presenting a wonderful coalition of Hu Yaobang, Zhao Ziyang and Deng Xiaoping. The anti-spiritual pollution campaign starting the following year worried some China watchers. Urban reform in 1984 made them relax. But then Hu was purged amidst economic retrenchment at the end of 1986. The fact that Zhao was later promoted soothed outsiders. In two years, Zhao again was purged and retrenchment again followed. In 1992, Deng Xiaoping, once more, spread new bliss of reform.

The struggle between Deng's reformist faction and Chen Yun's conservative faction resembles previous factional struggle remarkably in one fundamental way: it is mass socialism against state socialism. Deng, Zhao and Hu's decentralization policy benefits suburban peasants and general managers and workers who are basically also peasant masses in terms of social background.[21] People of whom they want to take good care are precisely those whom Mao once tried to motivate. This is mass socialism. The intention is to enrich them, in whatever way, regardless of the loss of efficiency. Deng's reform, in this sense, is a reform against central planning just like Mao's revolution. Zhao's policy of encouraging village industry and collective enterprises to break the rigid state enterprise system culminates in a cultural revolution in the economic sphere. State

socialism is interested in the mechanism that would transform state enterprises and their workers into efficient producers. Mass socialism cares welfare and income level of workers and peasants.

One lesson to the student of Chinese political economy is this: If there are distinctively separate state-society structures in China, one would not expect to see this type of oscillations between forces representing the state and those representing the society. Either the state or the society should have consistently dominated. Only when the state and the society overlap can one find the switch of the seemingly predominant forces rather easy. In other words, mass socialism and state socialism do not compete for support from two groups of people between whom the balance of strength would determine the result. Instead, mass socialism and state socialism compete to invoke social *vis á vis* state roles in each self. The struggle exists not between two groups of people although it may appear so; the struggle exists between two partial selves within every Chinese mind set. The resulting balance of strength between those invoked state selves and social selves can be easily accommodated by every partial losers who can then switch to the other partial self in themselves to meet the current. Side-shifting would thus not create serious psychological tension for an ordinary Chinese.[22]

Another lesson is that the state-society struggle in high politics is a political derivative of identity crisis. The dialectics between state and mass socialism, symbolized in the above struggle between the professional and the peasants-workers,

perpetuates the historical dialectics between gentlemen and little men.[23] Politics always occurs among gentlemen, but the cause and legitimacy of their infighting invariably has to do with the notion of public (i.e. little men's) interests. The issue concerns the choice between the state interests embodied in the survival and thriving of the state capacity and the social interests embodied in the wealth and equity in the society. Political opposition can always find ammunition as long as they can invoke the tranquil part of the self in everyone's mind set to challenge the prevailing part of the self. The identity crisis explodes as politics compels people to realize the colliding state and social roles of theirs. The crisis in turn fuels politics as if the drama of politics is the ultimate solution to finding a temporary residence for one's moral being now torn between two partial selves.

Reform

Current reform hurts the state from the pro-state point of view. First of all, decentralization slices the amount of resources available to the state central planners and thus reduces the state capacity. Secondly, the decline of the plan system impairs the credit of socialism as a state ideology. Thirdly, market mechanism incurs private, partial, and departmental consideration of all and damages the state as the exclusive and legitimate representative of public interests. Finally, reform induces those on high state positions to jettison their state roles and perform social roles and hence ruins the image of the state.

Reform allows many in the society to seriously consider to jettison their state roles once and for all. If this happens, a separate society would emerge. The society gains in the sense that economic development enables some sections of the society to systematically recreate themselves through the accumulation of social resources under their exclusive control.[24] As the society establishes its autonomy, the state would have to rely more and more on material incentives in order to mobilize social beings. This requires further decentralization. The society would gradually be able to lead the state to make decision so as to ensure continued support from those more autonomous parts of the society. Till this point, mutual penetration between the state and the society changes into unilateral penetration of the state by the society.

The balance sheet nonetheless displays some debt for the society. For example, since the state culturally and ideologically resides in the society, the decline of the state would inevitably lead to apprehension in the society as to what is collective, public interests. The rising ambiguity in the moral standards that determine the limit of private gain threatens the society as a meaningful whole. The moral chaos in the society actually paves the road for the state to revive. Anticipating this, partial interests in the society would hastily exhaust its exploitative and acquisitive possibility in order to gain as much as possible before the state revives and thus expedite the process of the state revival. The anticipation of the state revival would also thwart any serious effort that tries to bring down the state completely since all would need a state

position to hide whenever the state strikes back.

In the agricultural sectors, autonomous society may evolve, or revive, relatively easily because socialism in China has never perfectly organized the countryside along the lines of collective farm or people's commune. The state mentality is weak and the state control is relatively loose. The loophole in the countryside prepares the village industry to thrive and survive basically on its own ability, especially the ability to penetrate the state by using personal connections or bribe in achieving contract from the state enterprises. As some of these enterprises expand their productive scale and upgrade technological levels, they may begin to get involved in international networks. Coastal provinces have already witnessed the development of this sort. Some part of the society has seemingly achieved their autonomous status outside the traditional state-society complex.

Nonetheless, the state-society symbiosis may persist. On the one hand, the state can arouse the traditional emotion associated with the state as the sole representative of public interests. The state can do this in the name of nationalism, anti-imperialism, or even some revised form of socialism. The state can also come to the rescue whenever the nascent society runs into recession and thus reminds everyone the necessity of keeping the state leadership. This does not necessarily mean that those act in the name of the state would save the society upon their own initiative, but that those who fail out there in the nascent society would reclaim their state status and request remedy. All rational beings would protect their niches in the state as insurance premium. If, somehow, they must leave the state

completely, they are normally clever enough to arrange to have their spouses stay on in the state roles so that, when the time requires, the family as a whole continues to perform some state function in exchange for state protection.

In short, reform may have driven an wedge into the state-society symbiosis. This means that people feel more comfortable to assume their social roles in the public without an inner sense of shame. By no means, however, would they resist the return of the state. As long as a part, even a small part, of people's selves is still occupied by the state, Chinese politics would continue to proceed in a cyclical pattern.

Concluding Remarks

Clientelism as an analytical mode correctly reveals the strength of the state structure in resource allocation. Work unit socialism together with honeycomb as an analytical mode also portrays the integrity of social organization in shaping the allocation of resource. From a native Chinese point of view, the Chinese state cannot develop without the society serving as a model as to how the state should operate and, likewise, the society cannot last long without the state consolidating the image of public interests. The state-society coordination is not achieved through a dominant class (most likely bourgeoisie) or an all-loving philosophy king. Rather, the state-society relationship exists in everyone's mind. While the state-society approach correctly describes the structural forces that explain the available range of variety of political behavior in China, it could be misleading if the approach gives the impression that

there are separate groups of Chinese that serve as agents of the state and as agents of the society.

The state-society structures exert its influence directly upon each Chinese mind. Each Chinese mind is composed of at least two partial selves which enact the state role and the social role respectively and alternatively. This process helps make sense of the cyclical pattern of pro-state and pro-society policy, the easy adjustment of rank-and-file after each political struggle, and the quick return of seemingly losing factions. In sum, the state-society interaction in China reflects a state of mind and is a matter of identity and role playing.

OPENING CHINA TO THE WORLD ECONOMY: COMMUNIST INSTITUTIONS AND FOREIGN ECONOMIC POLICY REFORMS

Susan L. Shirk
University of California, San Diego

Of all the economic reforms introduced in China since 1978, none is more dramatic than the open policy to attract foreign investment and expand exports. Under communism China's economic system was an extreme form of import substitution (Lardy, 1992, p 16). After decades of self-reliance enforced by central planners, China radically reversed its foreign economic policies to enter the world market. The turnabout has been hugely successful, as measured by the growth of trade and foreign investment (see tables 1, 2, and 3). Between 1978 and 1990, China's average annual rate of trade expansion exceeded 15 percent, over three times the rate of growth of world trade (Lardy, 1992, p 7). The rigors of international competition also undoubtedly improved the welfare of Chinese citizens by increasing the quantity and quality of consumer goods available to them (not to mention other positive effects on the domestic economy).

The most remarkable fact about China's economic opening is that it was accomplished without any major transformations in the country's communist political institutions. The China case, characterized by Bruce Cumings (1989, p 218) as "a textbook example of how to introduce a developing country into the world capitalist system" is a case of economic reform without political reform. The success of China's opening flies in the face of our common sense understandings of the way economic development strategies are perpetuated by the vested interests of favored groups embedded in political institutions. We usually think of communist political institutions as particularly rigid and hostile to innovation. We expect communist party and government officials to defend their vested interests in a closed command economy by blocking reforms. How were Chinese leaders able to carry out market reforms and open policies through communist political institutions?

This paper will attempt to answer this question by analyzing the political-institutional dimension of China's opening since 1978.[1] I begin by describing China's previous import substituting foreign economic policies, their institutional logic, and the set of groups who were favored and protected by them. Turning to the drastic shift in policies in the late 1970's, I consider how, despite the political clout of the communist coalition standing behind the status quo, it was possible to open up the economy. My explanation focuses on the more decentralized and less institutionalized character of the Chinese version of communism, as contrasted with the Soviet version. I then go on to analyze the successful Chinese strategy for building a reform coalition in favor of foreign investment and trade, focusing on several features of the strategy, namely gradualism, administrative decentralization, and particularistic contracting. I conclude by examining how the strategy worked in two key reform policies, the decentralization of foreign trade and investment decisions and the establishment of the Special Economic Zones.

SELF-RELIANCE AND THE COMMUNIST PARTY-STATE IN CHINA:

For many years Mao Zedong's rhetoric of revolutionary agrarian populism disguised the true identity of Chinese and Soviet economic development strategies. Both communist parties were committed to rapid capital-intensive industrialization centered on steel and machinery, and both established economic and political institutions that reinforced a pro-industry and anti-agriculture bias. Once China's domestic development strategy was set, an import substitution trade regime naturally followed (Perkins, 1968; Lardy, 1992). Imports, largely of industrial equipment and material inputs, were targeted on building a self-reliant industrial economy.[2] Under central planning by material balances, industrial demand that could not be satisfied domestically (under rapid growth policies, excess

---

1 A fuller argument about the way Chinese political institutions shaped reform policy-making is presented in my book, The Political Logic of Economic Reform (University of California Press, 1993 forthcoming).

2 In contradiction to Cumings (1979), Lardy (1992, pp 30-31) argues that the Chinese import substitution development strategy adopted during the 1950's when the Soviet Union was selling China industrial plants, did not undergo fundamental change after the break with the Soviet Union in 1960. Food imports surged after the disaster of the 1959 Great Leap Forward, but during the 1960's, China continued a program of complete plant imports largely from Japan.

demand was common) was satisfied by imports. The need to finance a particular level of imports determined the level of exports. An inconvertible and overvalued local currency discouraged exporting and built a wall between the domestic and international economies. The only organization empowered to transverse the wall was the government foreign trade monopoly whose trade corporations handled all trade transactions and who subsidized exports with profits earned from imports.[3]

The big winners under the Chinese extreme version of import substitution were heavy industry (including workers as well as managers), inland provinces, the military,[4] and the central agencies of economic control, a set of groups we can call the "communist coalition."[5] The eighty percent of China's population who worked in agriculture were penalized by being cut off from world export markets which would have pushed the prices of their products above the low levels maintained by administrative fiat in China. Light industry and the more advanced coastal provinces were unable to benefit from their international comparative advantage offered by cheap, well-educated labor because they also were prevented from entering world export markets. Consumers, in both city and countryside, were harmed by the administrative suppression of consumption levels and the denial of access to foreign consumer goods (as well as the lack of availability of high quality domestic consumer goods).

In the 1950's, Chinese Communist Party (CCP) leaders modeled China's economic and political institutions on those of the Soviet Union to embody the developmental priorities they also adopted from the Soviet Union, namely heavy industry over light industry, industry over agriculture, and production over consumption. The lack of democratic elections meant that citizen-consumers and the agricultural majority were disenfranchised. The Communist Party,

---

3 With all trade corporations under the Ministry of Foreign Trade, if one corporation sustained a net loss, it was easy for the Ministry to reallocate financial profits from another money-making corporation (Lardy, 1992, p 26). The system of cross subsidies meant that China had a de facto multiple exchange rate system (Lardy, 1992, p 28).

4 Lardy (1992, p 23) notes that the military received preferential treatment in all of its trade transactions.

5 In a 1984 article, I identified a communist coalition consisting of three groups, heavy industry, inland provinces, and central agencies. (Shirk, 1984). I now believe that the military belongs in this coalition of groups favored and protected by communist policies.

and not the people, held ultimate authority. (Within the Communist Party, industrial interests were overrepresented and agricultural ones underrepresented both in the general membership and the Central Committee.) Politicians were accountable only to an elite selectorate of Communist Party and government officials that chose CCP leaders (Shirk, 1993). The CCP Central Committee that was the core of this selectorate consisted of three main blocs: Central CCP and government officials, provincial CCP and government officials, and military officers. The top Communist Party leaders appointed subordinate party, government, and military officials, and these officials, through their representation on the Central Committee, chose top leaders, creating the distinctive pattern of institutional authority characteristic of authoritarian regimes that I call "reciprocal accountability" (Shirk, 1993, Roeder, forthcoming).

The Communist Party delegated the work of making and implementing economic policy to the government State Council and the commissions and ministries under it.[6] The voice of industrial producers was amplified in these government institutions. The State Council had approximately fifteen heavy industrial ministries, but only a few ministries concerned with agriculture and only two (the Ministry of Light Industry and Ministry of Textiles) for light industry. The clout of heavy industry was enhanced by its intimate ties to the People's Liberation Army; all but one of the six (later eight) of the machine building ministries produced military equipment and were administered by the PLA. The absence of genuine legislative institutions representing regional interests robbed the economically stronger, more populous coastal provinces of a political voice and reinforced a redistributive development strategy favoring inland China. The distribution of power created by these political institutions tilted policy outcomes toward the extensive growth import substitution strategy that China had adopted from the Soviet Union.

The institutional arrangements for economic ownership and public finance also favored industry, particularly heavy industry.

---

6 CCP leaders anticipated little risk that government officials would act contrary to party preferences because the party had appointment power over government officials, exercised constant, tight "police patrol" oversight over the government through party committees and groups, and had ultimate veto power over government decisions. Moreover, having institutionally established who gets to sit around the table, the party expected few surprises from government decision-making (Shirk, 1993).

Heavy industrial ministries "owned" many of their factories and ran them directly from Beijing, while light industrial and textile factories were under local governments, and farms were collectively owned and managed. Without enterprises directly under their control, officials in the light industry, textiles, and agriculture ministries were considered to be political lightweights. A public finance system based on revenues from the profits of state-owned factories reinforced a system of administratively-set prices that made industry "rich" (i.e. profitable) and agriculture "poor" (i.e. not profitable). China's institutional arrangements tilted policy-making toward rapid industrialization and import substitution, policy outcomes that worked to the detriment of China's powerless consumers and peasants and benefitted the communist coalition of heavy industry, inland provinces, the military, and central agencies of control.

Institutions shaped policies, but policies also had institutional consequences. The self-reliance import substitution policy put a premium on administrative control and thereby strengthened the role of the Communist Party and government central planners, an outcome that undoubtedly pleased CCP leaders. The planners in the State Planning Commission determined which ministries and localities would be allowed to buy imported plants. The separation of domestic and world prices gave the Ministry of Foreign Trade stringent foreign exchange controls to reclaim all hard currency to pay for imports and subsidize exports.[7] To prevent massive urban unemployment under policies biased toward urban industry, the central government enforced strict restrictions on rural-urban migration. Import substitution may have resulted in economic irrationalities, but it enhanced the state's political control over the economy and society. The bureaucratic organizations responsible for enforcing this control, such as the State Planning Commission, the Ministry of Foreign Trade, the Ministry of Public Security, and the central departments of the Communist Party, naturally had a particularly strong interest in its perpetuation.

---

[7] After 1964, domestic and international prices were completely separate in an "airlock"system in order to protect domestic industry, particularly machinery from foreign competition (Lardy, 1992, p 24).

LEADERSHIP COMPETITION AND DENG XIAOPING'S REFORM INITIATIVE:

There was nothing inevitable about Deng Xiaoping's decision to open China's economy to foreign investment and expanded trade. The Chinese version of the command economy that had operated under Mao Zedong's rule had produced accomplishments as well as problems. China's economic problems, moreover, were nothing new; they were apparent to many Chinese economists as far back as the 1960's. And it was by no means obvious that marketization and opening-up were better solutions than improving the quality of central planning. By the time of Mao's death in 1976, members of China's political elite did agree that restoring the Communist Party's prestige after the Cultural Revolution debacle required improving economic performance and raising living standards. The self-doubt of the Chinese elite, brought back from their first trips abroad to more advanced countries during the 1970's, also motivated them to strong action on the economic front. Despite an elite consensus on the political necessity of economic progress, there was no agreement on the meant to achieve it.

Deng Xiaoping had expressed an opinion, back in the mid-1970's, that economic isolation was detrimental to China's welfare and national security, a view that was lambasted by the radicals who dominated policy-making at that time as characteristic of "lackeys and compradors in the service of foreign bosses."[8] Deng argued in 1974-75 that there was a real danger of war with the Soviet Union and that China's economic backwardness put it at risk. The way to accelerate economic modernization was to import technology, equipment, and managerial skills from the West; improved political ties between China and the Western countries, including Japan, created a favorable international environment for such imports (Huan, 1987). Deng's proposals for expanding trade (nothing was said about foreign investment) were blocked by his radical rivals, and he was purged again, not to return until after Mao Zedong's death in 1976. As a result of the backlash, foreign trade stagnated during 1974-77.

[8] Zheng Tuobing, "To Promote China's Foreign Trade Under the Reform and Open Policy," To Build Socialism with Chinese Characteristics, Zhongguo zhanwang chubanshe, 1985, pp 40-42, cited in Huan Guocang, 1987, p 42.

Mao's chosen successor, a politically weak and relatively unknown figure named Hua Guofeng, picked up on some of Deng's ideas about increasing exports and importing more technology, but colored them with Mao's ideological rhetoric of mass mobilization and tilted them squarely in the direction of the old communist coalition. The increase in world oil prices was a major factor in Hua's policy to base China's new great leap outward on petroleum exports. The leaders of China's energy and heavy industrial sectors (which are concentrated in inland regions), the so-called "petroleum faction," formed the core of Hua Guofeng's support. There was not an iota of market reform suggested in Hua's development strategy To the contrary, Hua's vision was of a highly centralized stepped-up import substitution drive directed toward heavy industry and led by oil exports.

It was in this context that Deng Xiaoping sought to regain national political power and replace Hua as China's top leader. He had to find an alternative policy vision that would help him build a coalition of supporters within the selectorate. Hua appeared to have the traditional communist coalition (heavy industry, inland provinces, military, central bureaucracies) in his corner. To create a reform coalition, Deng turned to light industry and agriculture, coastal provinces, and provincial officials. He appealed to these groups with a platform of decentralization, marketization, and economic opening.

The introduction of domestic market reforms and the opening to the international market should be understood as Deng Xiaoping's strategy to depose Hua and win the contest for leadership succession. Reform initiatives in communist countries must come from above, from the first tier of elites trying to build constituencies among the second tier who constitute the selectorate. Communist institutions preclude overt demands for policy innovation from below by disenfranchising society and by prohibiting bureaucrats from ministries, provinces, etc. at the second tier and lower from forming blocs to press for change.[9] [10] Because there is no separate sphere of

---

[9] Because ordinary citizens have no institutional voice in communist authoritarian regimes, citizen collective action through protest becomes all the more important. Therefore groups that find it easier to organize mass protests (e.g. urban workers) are more influential in authoritarian regimes than those who find it harder (e.g. peasants).

[10] Scholars who study non-communist third world countries often ascribe reform initiatives to "change teams" of technocrats (Waterbury, 1992) or the

political competition (such as elections), the contest for power is piggybacked on the policy process within the bureaucracy. Power and policy are completely intertwined. With no fixed terms of office, the influence of succession competition on the policy process is almost constant, becoming particularly intense when the top leader is old or conspicuously weak, as was the case with Hua Guofeng in 1977-78.

Deng Xiaoping's challenge to Hua Guofeng received an unexpected boost at the end of 1978 when estimates of Chinese oil reserves were revised downward and commitments to import plants and expand heavy industry could not be sustained (Cumings, 1989, p 210). The 1978 annual plan which had been based on overly optimistic projections of oil production essentially collapsed. Having made the decision to open the door to technology imports, the Chinese leaders suddenly realized that they had almost nothing other than oil to export for hard currency. A sense of economic crisis pervaded meetings of party leaders.

Deng Xiaoping took advantage of the economic crisis to discredit Hua Guofeng and weaken the heavy industry czars from the petroleum faction who dominated the central government. His platform, introduced at the Third Plenum of the Eleventh Central Committee in December 1978, consisted of 1) decentralization and gradual marketization of the domestic economy and 2) foreign economic policies that welcomed foreign investment and promoted exports of light industrial manufactured goods. The foreign economic plank of the platform made economic sense in that China had a comparative advantage in light industrial production because of low labor costs, and the rapid economic growth in Hong Kong, Japan, and the East Asian NICS had enlarged markets for Chinese processed food and consumer goods.[11]

"embedded autonomy" of technocratic government agencies (Evans, 1992). Such phenomena are impossible to find in communist systems because even with reciprocal accountability, top-down political controls over bureaucratic careers are very strong, and communist oligarchs keep the bureaucracy compartmentalized to prevent coordinated action among the second tier. It is also worth noting that Chinese government bureaucracy in the late 1970's had a very small number university-educated technocrats because for decades Mao stressed political loyalty over expertise in bureaucratic promotion.

11 Although improved relations with the United States and Europe created conditions for financial and technical assistance from these countries, economic recession and protectionism limited markets for Chinese manufactured exports in those countries. It certainly doesn't appear that

The new foreign economic approach also made excellent political sense from Deng's perspective. It allowed Deng to make an end-run around the central planners and industrial bureaucrats who perpetuated import substituting self-reliance by appealing to the beneficiaries of the open policy, namely light industry and agriculture, coastal provinces, and provincial officials. The main components of Deng's open policy, introduced in a series of policy initiatives over the decade after 1978, included the following:

--- Expanding exports, particularly of light industrial manufactured goods, by decentralizing and making more incentive compatible foreign trade administration. The monopoly of the central Ministry of Foreign Economic Relations and Trade (MOFERT) was smashed and trading authority dispersed among various ministries and provinces, who also were allowed to retain a proportion of their foreign exchange earnings.

--- Acquiring foreign technology, investment, and managerial and international marketing know-how through joint ventures. To attract foreign investment, approval authority was decentralized to ministry and provincial officials.

--- The creation of Special Economic Zones in the coastal provinces of Guangdong and Fujian authorized to offer concessionary terms to foreign investors.

POLITICAL INSTITUTIONS AND REFORM STRATEGY:

How could Deng carry out foreign economic reforms through Chinese political institutions that empowered the communist coalition, not the potential beneficiaries of reform? The answer is that the Chinese version of communism proved to be more flexible than the Soviet version because in China, political and economic authority was more decentralized and less institutionalized than in the Soviet Union. In the context of Chinese political institutions, it was possible to break down reforms into particularistic benefits for Chinese officials and thereby create bureaucratic vested interests in reform.

China's new strategy of growth led by light manufacturing exports was driven by dramatic increases in world market demand for these products.

Under Mao Zedong, Chinese central control over economic life was never as extensive or effective as in the USSR itself, and the role of local government was stronger. Mao pioneered the political strategy of "playing to the provinces" later adopted by Deng Xiaoping to promote economic reform. In the Great Leap Forward (1958) and the Cultural Revolution (1966-69), Mao sought to overcome the resistance of stodgy central bureaucrats to his vision of accelerated growth and revolutionary collectivism and egalitarianism by promising provincial officials more authority and resources and by expanding the bloc of provincial officials in the Central Committee. In China, as a result of Mao's initiatives, a substantial share of economic activity went on outside the national plan and much of it was administered at the provincial level. The central party-state bureaucracies were a less formidable obstacle to market reforms, and previous waves of administrative decentralization created the possibility that provincial politicians could become a reformist counterweight to the more conservative center. Although these provincial politicians are appointed by the central Communist Party organization, under reciprocal accountability they also have the leverage of a key constituency in the selectorate.

China also was way behind the Soviet Union in giving institutions and not personalities the authority to make decisions.[12] The Central Committee of the Soviet Communist Party definitively established its authority to choose party leaders in 1957; although the CCP Central Committee has the same constitutional powers, its actual authority is still shared with other party elites, some of whom are retired elders who do not even hold official posts. The locus of authority is ambiguous because it is actually moving from an informal group of revolutionary elders to the collective institutions of the Communist Party. In the Soviet Union, the pre-eminent leader's authority to dispense patronage and determine the membership of the Central Committee was highly constrained by the collective norms of the party; in China, Deng Xiaoping had much more latitude to dispense patronage and shape the Central Committee, and he used it to build support for himself and reform.

---

12 China's evolution from personalistic rule to institutionalized authority was retarded due in large part to Mao Zedong's attempts to sustain his revolutionary charisma and stem the trend of institutionalization (which is disparagingly called "revisionism") by launching mass campaigns.

The looser, less institutionalized character of Chinese communist institutions made it possible for Deng Xiaoping to introduce economic reforms without radical changes in the political rules of the game. Because reform policies had to be processed through the communist party-state bureaucracy, however, it took some artful strategy on the part of Deng and his allies. The most important features of this strategy were gradualism, administrative decentralization, and particularistic contracting:

Gradualism: To avoid antagonizing the communist coalition, reforms were introduced gradually. Instead of attacking the perquisites and powers of the central planning and trade agencies head-on, Deng Xiaoping decided to encircle the government bureaucracies by creating new forms of business exempt from normal state rules, such as private, collective, and joint-venture firms and the Special Economic Zones. A two-track system was created, and producers were drawn away from the plan by the higher prices and foreign exchange earnings in the market track. The plan continued to exist, but the economy was allowed to outgrow the plan. Even state enterprises were permitted to participate in the market track after they met their plan quotas. Officials who served as gatekeepers to the more lucrative market track were able to reap personal political and economic rewards.

Administrative decentralization: Deng's strategy primarily involved administrative decentralization to local governments, with a small degree of economic decentralization down to the firm level. Authority to manage foreign trade, approve foreign investment projects, and control hard currency were devolved to lower level officials, not to managers themselves. China's open policy involved ending the central foreign trade monopoly and dispersing authority to various bureaucratic actors, but it was by no means true trade liberalization. The provincial officials who were a key constituency in the selectorate were the prime beneficiaries.

Particularistic contracting: A key feature of Deng Xiaoping's political strategy of economic reform, both in the domestic and foreign sectors, was what I call "particularistic contracting." New arrangements for foreign trade and investment, like those for domestic industrial management and finance, were negotiated for each unit (province, locality, or firm). First, a small number of units were chosen to be reform "experiments" that were not only allowed

new freedoms but also were blessed with other preferential treatment to guarantee that the "experiment" was successful.[13] Naturally, other units demanded the same deal. As the scope of reforms expanded, party and government officials at every level from the center down to the county gave out generous reform contracts to build factions of grateful clients. Reform proposals that applied standardization formulas to each unit were consistently rejected in favor of proposals that applied different rules to to each. The particularistic contracting model of economic reform was politically successful in the context of Chinese political institutions because it mimicked the familiar pattern by which production, supply, and trade quotas were bargained out and political support networks built under traditional central planning. Moreover, particularistic contracting reforms were embraced because they were a way to make inherently redistributive reforms non-(or less-) redistributive; enterprises and localities could make sure they were no worse off by implementing reforms. The patrimonial style of Chinese communist politics (which was caused as much by the absence of institutional checks on patronage within the CCP as by the persistence of Chinese cultural tradition) proved to be an advantage in building bureaucratic support for the reform drive. Chinese style economic reform was successful in large part because its particularistic contracting form generated political resources for communist politicians from Deng on down.

Some other elements of the Chinese strategy of foreign economic policy reform were institutional tinkering, sidepayments, and protectionism:

Institutional Tinkering: To prevent the central planners and heavy industrial bureaucrats who dominate government policy-making from blocking the opening policies, Deng made sure that decisions on these policies were made in a highly centralized manner either in the Communist Party Secretariat or the State Council.[14] To make an end-run around the government commissions and ministries, Deng

---

13 The term "experiment" is a misnomer. Chinese reform experiments closely resembled the model farms, factories, and localities of the previous era that Mao Zedong used to propagandize and build bureaucratic support for his policy initiatives.

14 See Bates and Collier (1991) for another example of how political entrepreneurs in authoritarian regimes open up space for policy innovation by strategically shifting policy-making arenas back and forth between party and government.

created new ad hoc institutions like the Special Economic Zone Office to implement the new foreign economic policies.

Sidepayments: Deng was also careful to coopt key individuals and groups in the communist coalition with sidepayments to obtain their acquiescence to reform. The children of senior leaders, including conservative leaders who were potential opponents of the opening policies, were allowed and even encouraged to pursue careers in foreign trade companies where they made small fortunes trading on their high level influence. The energy industries were satisfied by the continued promotion of oil exports (international oil prices didn't drop until the mid-1980's) through off-shore exploration financed by foreign oil companies and by large foreign investments in coal. Central authorities made special efforts to attract foreign investment. to modernize China's manufacturers of aircraft, automotive vehicles, and other heavy equipment. When preferential foreign exchange retention rights were granted to coastal provinces, they were extended to several poor inland provinces at the same time. The exports of military industries were highly subsidized by preferential foreign exchange retention rights.

Protectionism: Deng's strategy of gradualism also involved protecting the domestic market from being flooded by foreign products and destroying China's dinosaur heavy industries and infant consumer goods industries. Only when Deng and other pro-reform leaders decided in 1992 that entrance to GATT was essential to realize their economic goals, did they agree to open the domestic market to a substantial flow of imports. Despite continued protection against international competition, local industry became more competitive due to new pressure from private, collective, and joint venture enterprise.

TWO CASES OF FOREIGN ECONOMIC POLICY REFORMS:

The Decentralization of Foreign Trade and Investment Authority:

The decision to smash MOFERT's monopoly over foreign trade management was essentially a choice to reduce central control in order to increase the volume of trade and build bureaucratic vested interests in the open policy. Under the MOFERT monopoly, a dozen of the ministry's trading companies had handled all foreign trade transactions; by 1990 there were more than 5000 trading companies

established by ministries, provinces, and cities. By the end of 1987, there were nearly 900 foreign trade companies in Guangdong province alone (Lardy, 1992, p 39).

Deng Xiaoping and his allies chose a path of gradual decentralization of trade rather than moving rapidly to its full liberalization. This choice involved maintaining the inconvertibility of Chinese currency during the transition and distributing differential rights to retain foreign exchange earned from exports (i.e. import entitlements) to provinces, ministries, cities, and enterprises as an export incentive. Because domestic economic reform generated a tremendous hunger for imports of both assembly lines and consumer goods, the system of foreign exchange retention rights generated a valuable selective benefit that officials could distribute to their friends and supporters or keep for themselves.[15]

Over the decade, central authorities distributed an increasingly large share of foreign exchange earnings to local governments and enterprises.[16] As a favor to provincial and municipal officials, the first foreign exchange retention rules introduced in 1979 allowed locally managed firms to retain 40 percent of their export earnings over the 1978 level, while ministry managed firms could keep only 20 percent. Beginning in the early 1980's, especially generous retention deals were given to certain regions (the coastal provinces of Guangdong and Fujian and the remote inland province of Xinjiang) and sectors (petroleum, machinery and electronics, military industries, and science and education). In 1982, the State Council set fixed retention rates for each province; the rates ranged from 3 to 25 percent (the average provincial rate was 8 percent). In 1985, the provincial foreign exchange retention rates were raised to a minimum of 25 percent; the rates for Guangdong and Fujian were lifted to 30 percent, and seven inland provincial-level regions (Inner Mongolia, Xinjiang, Guangxi, Ningxia, Yunnan, Guizhou, and Qinghai)

---

15 In 1985 and 1986, the central government temporarily froze the foreign exchange in the hands of local officials by putting strict controls on its use. This move was a response to the Hainan auto import scandal in which officials on the island took advantage of their preferential access to foreign exchange to import automobiles for resale in Guangdong and other provinces, and to overall trade deficits.

16 By the mid-1980's, 42 percent of all foreign exchange was in the hands of the provinces and export producers, and only 58 percent was controlled by the central government. As a general rule, of the foreign exchange retained by locals, half went to the enterprise and half to the level of government that "owned" it (Lardy, 1992, pp 56-7).

were allowed to retain half their foreign exchange earnings. Producers of machinery and electronic product exports had their retention rate raised to 65 percent. Also in 1985, a new system was established that gave most provinces 25 percent of the earnings of planned exports, and 70, 80, or 100 percent of above-plan earnings. By 1986, the four Special Economic Zones and four development zones (including both coastal and inland) in Hainan, Huangpu, Guangzhou, and Xijiang were allowed to keep all their export earnings. A 1987 policy encouraged the export of light industry, arts and crafts, and garments by raising their retention rates (information in this paragraph is drawn from Lardy, 1992, pp 53-57).

Under the dual track system, the national budget continued to take domestic currency losses on foreign trade and export incentives remained inadequate. The central government's solution was another form of particularistic contracting called foreign trade contracts. All provinces and national foreign trade corporations signed contracts with MOFERT specifying the quantity of export earnings (in foreign exchange), the quantity of foreign exchange to be remitted to the central government, and the level of domestic currency profits and losses in foreign trade transactions. The contracts, negotiated individually for each provinces, perpetuated the practice of granting provinces different rates of foreign exchange retention (Lardy, 1992, pp 102-3).

The Chinese gradual, decentralized, particularistic approach to reforming foreign trade administration and encouraging exports was extraordinarily successful in both political and economic terms. The perpetuation of a two-track system won bureaucratic (especially local) support for the open policy by creating a system of selective access to foreign exchange and imports. But the reformist leadership wisely did not rest at this politically useful but economically irrational half-way point.[17] Over the decade the steady devaluation of the yuan and creation of swap market trading centers brought the currency very close to convertibility, so that by the end of the 1980's access to foreign exchange was no longer a significant issue.

The decentralization of foreign trade administration was accompanied by decentralization of authority to approve foreign

---

17 In fiscal and industrial finance reform, on the other hand, the reforms still are stuck at contracting, which is a political equilibrium but an economic cul-de-sac.

investment projects. With both types of decentralization, local officials were happy to be unleashed to gain access to foreign technology, equipment, and capital. Fiscal reforms had given them a direct stake in the profits of local industry, and an imported color T.V. assembly line or a joint venture with a foreign firm could mean a windfall. Once central controls were lifted, local officials hustled up foreign business like seasoned merchants by offering tax breaks and other inducements, and the volume of trade and foreign investment grew dramatically.[18] An inevitable consequence of decentralization was an intensification of competition for foreign business among provinces and a resulting loss of bargaining power for China as a whole vis a vis foreign corporations (Shirk, 1990).[19]

The Creation of the Special Economic Zones:

In another example of the politically successful strategy of gradualism, decentralization, and particularism, Deng Xiaoping created special economic zones as the leading edge of China's entry into the world economy. In 1979, he authorized special trade and investment measures for two coastal provinces, Guangdong and Fujian. One such special measure was the creation of special zones allowed to offer concessionary terms to attract foreign investment projects that would transfer modern technology and expand exports. As reform experiments, the zones were allowed to escape almost completely from the old planning system and come close to establishing a market economy.[20] At first, only four special economic zones (SEZ's) were established, three in Guangdong (Shenzhen, Zhuhai, and Shantou) and one in Fujian (Xiamen).

The political logic of the creation of the SEZ's was clear. Deng Xiaoping was just beginning to consolidate his power after

---

18 Exports did not grow rapidly until the rate of exchange was improved and tax subsidies for exporters increased in the second half of the 1980's.

19 Competition among provinces and localities for foreign business, however, had a salutary affect on the economic decisions of local officials. In the early days of reform, local officials took advantage of their new economic authority to subsidize loss-making enterprises and build patronage machines; they paid little attention to raising efficiency or investing in needed infrastructure. But over time, competition for foreign investors led them to push firms to become more efficient so that they could concentrate funds on building the airports, telecommunications and roads that would create an attractive environment for foreign investors (Rawski, 1992, pp 11-12).

20 For example, the SEZ's are still the only places in China with actual labor markets.

supplanting Hua Guofeng as national leader. Drastic reforms which would not have been acceptable to the conservative elders and members of the communist coalition if implemented on a wide scale, could be sold if they were limited to a small number of experimental points (Crane, 1990, pp 28-29). Deng also could argue to the conservatives that locating special zones in direct proximity to Hong Kong and Taiwan would help reassure these two areas about reunification. (Crane, 1991, p 37).[21]

The economic dynamism stimulated in the SEZ's by the special subsidies and freedoms they were granted naturally sparked envy among other less fortunate regions. Shanghai, which had always considered itself China's economic capital, fiercely resented the preferential treatment given to the zones.[22] Inland provinces objected to the widening of the economic gap between themselves and the SEZ's on the coast. The regions who felt left behind reacted in three different ways. First, they tried to sabotage the SEZ's and the open policy with ideological attacks on them for selling out the country to the foreigners and tolerating corruption and cultural decadence (Crane, 1990, p 36).

At the same time, however, the other regions rushed to get a piece of the action by setting up businesses in the zones, mainly in Shenzhen. With its market economy and access to foreign funds and markets, Shenzhen became an important domestic trade entrepot where firms could buy and sell steel, cars, consumer goods, and almost anything else. Shenzhen even established its own shipping companies to transport the goods. (Shenzhen benefitted from the tremendous demand for inter-regional trade that had been pent-up by administrative blockades erected by local officials responding rationally to fiscal and industrial decentralization). The inward domestic orientation of the SEZ's was viewed as a problem by many

---

21 As Chen, Jefferson, and Singh (1992, pp 212-213) point out, Hong Kong, and now increasingly, Taiwan, have had a profound effect on P.R.C. economic development as trading partners, financiers, and intermediary. As of 1988, exports to Hong Kong were 40.8 percent of China's total exports (3/4 were re-exported), and 30.8 percent of China's total imports came from Hong Kong (more than 2/3 of them were processed in China and re-exported through Hong Kong). Of the $3.2 billion of direct foreign investment in China in 1933, 2/3 originated in Hong Kong and Macao; Guangdong province claims 43 percent of China's total foreign direct investment.

22 When I interviewed the then-mayor of Shanghai, Wang Daohan, in 1985, even before I asked the first question, he launched into a long tirade about the center's special treatment of Guangdong province and its SEZ's.

people who believed that the zones were supposed to be primarily outward oriented (Tzeng, 1991, pp 274-5). In fact, the economic ties between the SEZ's and the inland areas created economic benefits for both and widened the base of political support for the open policy.[23]

The creation of specially privileged foreign trade and investment zones also spurred other regions to demand similar privileges for themselves. Economic envy is a powerful motivation. Provincial officials, many of whom were initially hostile to the open policy, soon began to advocate extending the policy throughout China. Such pressure was responsible for extending zone-like freedoms to fourteen coastal cities in 1984 and to three larger delta areas (the Pearl River delta, the Yangtze delta, and southern Fujian) in 1985, and to the Pudong zone in Shanghai in 1989. Officials from the interior remained dissatisfied and in 1988 organized a series of meetings arguing for the benefits of the open door to be spread beyond the coastal areas (Tzeng, 1991, p 279). In response, the center expanded the foreign trade and investment autonomy of a number of inland provinces and localities. By selectively authorizing particular places as privileged open zones, beginning with a small number and gradually adding more, the Chinese leadership brought even inland officials into the reform coalition.

CONCLUSION: COMMUNIST INSTITUTIONS AND OPENING REFORMS:

The simplistic notion that communist bureaucracies are so wedded to central planning and self-reliance that they block any attempts to change was proven false by the Chinese case. The Chinese version of communism, more decentralized and less institutionalized than the Soviet version, made it possible for an entrepreneurial economic reformer like Deng Xiaoping to dramatically expand Chinese foreign trade and investment without altering political institutions. Deng's strategy of gradualism, administrative decentralization, and particularistic contracting created new bureaucratic vested interests in the open policy. Chinese communist institutions proved their flexibility as the bureaucratic support for reforms snowballed over the decade. By

---

23 As Cumings (1989, p 218) points out, China's huge domestic market gives it an advantage over other newly-industrialized countries with less purchasing power at home that run into trouble when protectionism cuts their access to the U.S. market.

1990, the bureaucratic coalition for the open policy had grown beyond the core groups of light industry and agriculture, local officials, and coastal provinces to include even many inland provinces and heavy industries. Foreign firms and governments were also an important element in the domestic political coalition promoting opening. The political momentum was to extend the deregulation and marketization of foreign economic relations, not to restore central control and self-reliance. The open policy has become irreversible, locked in by strong bureaucratic support.

Although China's dramatic turnaround in foreign economic policy was accomplished without fundamentally changing its communist authoritarian political institutions, in the long run the open policy will generate pressures for political reform. Foreign democratic ideas have entered the country through the open door, carried by returning Chinese students, mass media, and expatriates living in China. The coastal provinces that are the leading edge of China's opening will demand national political institutions that give them a larger voice. And the cadre capitalists who have set up trading companies will demand legally-protected property rights. Still the sequence of economic reform before political reform has some real advantages. By the time the pressures for political reform build to the point that China expands the political arena to include elected representatives who might push for protection and re-regulation, the country's industrial and trade regime is likely to be strong enough to sustain international competition.

THE COMMUNITARIAN LIBERALISM OF T.H. GREEN

Avital Simhony

Department of Government
The College of William & Mary

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993.

I: Introduction

This paper examines the non-individualist liberalism of T.H. Green in light of the current liberal\communitarian debate. That debate has been dominated by the "tyranny of dualism" introduced by communitarian critics of liberalism. Their methods of interpretation "invites us to see the moral universe in dualistic terms: either our identities are independent of our ends, leaving us totally free to choose our life plans, or they are constituted by community, leaving us totally unencumbered by socially given ends; either justice takes absolute priority over the good or the good takes the place of justice" (Gutmann 1985: 316-317) and so on.

Underlying these various oppositions is a dichotomy between, as Sandel puts it, "a politics of the common good" (communitarianism) and "a politics of rights" (liberalism) (Sandel 1984: 6). These two visions of politics are said to draw on two opposed visions of social relations. Whereas the common good is associated with a holistic perspective of community, the politics of rights presupposes an atomistic vision of society. And while for communitarians the basis for legitimacy is a shared conception of the good, for liberals a shared sense of justice (which yields a framework of rights) is the basis of legitimacy. Thus communitarians tend to downplay the importance of rights and justice as the foundational stone of political theory; instead, they assign pride of place to what they suggest is the opposite: a shared conception of the good in the shape of a socially endorsed way of life. Communitarians further believe that their own arguments revive and draws on Hegel's criticism of Kantian individualism and Aristotelian ideas of communal ends and citizenship, while liberalism draws support from the Kantian view of the choosing individual, independent of desires and goals.

This paper seeks to challenge the discourse of the "tyranny of dualism" which has dominated the current debate. Instead it claims that the relationship between liberalism and communitarianism cannot be one of simple opposition, for which evidence is abound in the history of liberal thought. I suggest that T.H. Green's liberalism (as well as New Liberalism generally) is an excellent case in point.

Green is of special interest to this debate for two reasons. First, he was a self-conscious communitarian liberal who set out to reconcile the liberal subject with human community. For him the choice between the situated and unencumbered self, or the choice between community and citizenship on the one hand, and rights and justice, on the other, is no choice at all. Indeed, his moral and political philosophy defies classification in terms of Sandel's dichotomy of the politics of the common good and the politics of rights. Crucially, Green's approach to moral and political philosophy is the opposite of the "tyranny of dualism" approach which underpins the communitarian method of interpretation and can be described as "relational." Accordingly, Green's non-individualist liberalism can be referred to as "relational liberalism." Second, and relatedly, Green draws on the intellectual resources of both sides of the current debate. Thus, Aristotle and Hegel as well as Kant are equally essential sources of his liberalism. I believe that his unique attempt to construct

communitarian liberalism merits attention.

II: The Common Good

The best entry to Green's liberalism is his idea of the common good. This is because it lies at the hear of Green's moral and political theory, and further because the common good both rests on, and is expressive of, Green's relational approach to liberalism. It is, however, a problematic entry. Although it is widely agreed that the common good "is absolutely central to Green's theory," (Harris & Morrow 1986: 6) there is little agreement on the nature of that idea, as well as a great deal of criticism relating to the ambiguity of the common good, its practical value, its consistency and its quietist overtones. While it is not the object of this essay to address these criticisms directly, I hope that an adequate understanding of the idea of the common good will show that far from being an ambiguous notion, it embraces an explicit view of an ideal society which, in turn, issues in a clear action-guide for individuals and institutions.

Green's view of the common good is a solution to a problem. It is a problem which Sidgwick regards as "the profoundest problem of ethics," (Sidgwick 1907: 386,n.) namely the dualism of practical reason: how to reconcile the good of one with the good of others, self-love and benevolence, interest and duty. Sidgwick credits Butler with articulating that dualism, which also underpins the moral theories of Hobbes and Kant. Sidgwick also believed that he failed to resolve the dualism of practical reason. Green, however, believed that he succeeded in doing just that (PE, 225-239).

The solution, according to Green, lies with an adequate understanding of the true good of a rational agent. The true good of a rational agent is the "common good; [namely] a good in the effort after which there can be no competition between man and man, of which the pursuit by any individual is an equal service to others and himself." (PE, 283; 244, 281, 284; Kant, 107, 112, 123-124, 126) "Equal service"--or as Green also calls "mutual service" (PE, 244)--is the action-guide that the idea of the true good generates and justifies. Mutual or equal service entails that, positively, pursuing the good by oneself benefits others and, negatively, no one can gain by another's loss (PE, 176, 203, 246, 273-274, 285-286; Kant, 118) It is equal service because it presupposes the moral equality of individuals as free and rational agents. It is mutual service because it avoids both self-love (because others benefit too) as well as benevolence (because oneself also benefits). The idea of mutual service is the core idea of the common good and shows that the common good unifies human action, thereby ensures that practical reason is not fractured and that the principles of human nature are not left asunder.

That this is so can be shown in a four-step reconstruction of Green's analysis of the good of a rational agent:

(1) The good is self-satisfaction.
(2) The true, as contrasted with the apparent, good is self-realization or

self-betterment.

(3) Self-realization requires a disinterested interest in the betterment of others.

(4) Self-realization is the common good.

Let me explain. (1) The good is self-satisfaction. Green argues against hedonist utilitarianism that the good as such, generic good, is not pleasure but satisfaction of desire. (PE, 171; Kant, 114-115) Pleasure may accompany the satisfaction of desire, but pleasure is never the object of desire. That generic good is self-satisfaction accords unity to the self and to human action which, Green believes, can overcome Kant's view of a self which is divided between two opposed selves, sensuous and rational, each with its own sources of action. If self-satisfaction is the good of a rational agent who is an object to himself, then in all actions the self is free or self-determined. However, depending on the nature of the object in which the self seeks satisfaction, only a certain kind of self-determination is self-realization. Put differently, Green holds that all human actions are formally free, but only some are really free, depending on the nature of the ends in which the agent seeks self-satisfaction (PE, 154; Kant, 92, 83; DSF, 16).

(2) The true good is self-realization. The rational nature of the agent--the capacity to conceive a better state of oneself as an end to be realized by action--requires full realization of human capacities, not merely (habitual) satisfaction of any desire the agent happens to have. (PE, 174-179; DSF, 20-25)

(3) Self-realization requires disinterested interest in the betterment of other persons. Disinterested interest means interest in something for its own sake, not as a means to an ulterior end. Green believes that one cannot realize one's capacities in isolation. The development of individuality does not require "pure individualism, ... simple detachment of man from man ..." (PO, 37), but rather requires social relations: "it is only in the intercourse of men, each recognised by each as an end, not merely a means, and thus having reciprocal claims, that the capacity [for self-realization] is actualised and that we really live as persons" (PE, 183). Green thus seeks to secure the development of individuality by divorcing it from individualism and situating it in relation of mutual interdependence. Practical awareness of that relation teaches us that for us to exist and develop as persons we need the recognition of those whom we recognize as persons and vice versa.

Such practical understanding generates "mutual interest" of persons in each other: "They are interested in each other as persons in so far as each, being aware that another presents his self-satisfaction to himself as an object, finds satisfaction for himself in procuring or witnessing the self-satisfaction of the other" (PE, 190; 199-205, 229-232). If one's self-satisfaction is dependent on the self-satisfaction of others, then the self-satisfaction of others is, ipso facto, a matter of interest for one and vice versa. This entails that the satisfaction of our nature demands that our associates be likewise developed: their growth and satisfaction contribute to ours and vice versa. It is the kind of relation in which the growth of one's capacities does not diminish the capacities of others but enhances and raises them.

(4) Self-realization is the common good. Self-realization is the true good which is the common good. Self-realization is the common good because it meets the requirements of mutual service. Self-realization of one should not be achieved by the degradation and exploitation of others but should be obtained by others benefiting. When all act on mutual service the common good obtain. The common good is an essentially social idea since self-realization requires social relations of mutual interest.

The common good, indeed, is an ideal of "some sort of society" (PE, 332) which lies at the heart of Green's social morality, and which Green sometimes describes as "social union" (PE, 281, 283, 284). But what sort of society? The sort that is constituted by relation of mutual interest. When individuals and institutions adhere to the action-guide of mutual service, the common good society obtains: an ideal of social union which excludes no one; that is to say, it is in the interest of all and all are interested in it (PE, 205, 232, 244-245, 271; PO, 122-123, 132). Hence, interest in the maintenance and advancement of social union, which is "a community of good for all," [PE, 244-245] is at once an interest in the good of one and the good of others and, therefore, a mutual service.

Both the Kantian idea of the kingdom of ends and the Aristotelian idea of virtue are essential sources of Green's idea of the common good.

III: Kant's Kingdom of Ends

Green believes that the structure of mutual service, including its positive and negative postulates, is explicit in Kant's idea of the kingdom of ends. Positively, in seeking to realize, "in my own person," the end of "conformity to self-imposed law", "I am realising it for the benefit of everyone else, for everyone is concerned in the disinterested readiness to conform to law on the part of everyone else." (Kant, 107) Negatively, in seeking to realize my end, I do not exclude or degrade others by treating them as a means only since "if ... it is really the idea of conformity to self-imposed law which moves me to any act, I cannot in the act be using humanity in the persons of others otherwise than an end." (Kant, 107)

The Kantian structure of mutual service is grounded in terms of rationality. "It [i.e., the conformity by all to universalizable laws] is an object to us ... in virtue of that which unites us, which gives us the idea of a common good, our reason." (Kant, 107)

Universal rationality is the distinguishing feature of human agency and the defining property of the person whose actions are constrained by it. Two constraints which are particularly relevant here are the categorical imperatives of universalizability and respect for humanity. Universalizability requires people to act only on principles which are universal in from in the sense that the agent can will that the principles become universal, followed by all people at all times. Universalizability also entails and indeed requires that one treats all human beings never as mere means to ends but also as ends in themselves. This is the second categorical imperative, which sets constraints on one's behavior. Universalizability requires that

one treats another as an end because it is impossible for a creature with a will to regard it (the will) simply as a means to an end. I must act so as to will the maxim of my action as a universal law and I can do this only if I respect the rationality of others; if not, my law is not addressed to universal reason. Hence I must treat all rational beings as ends, not as means only. That is in turn possible only if I envisage myself and others as like members of an ideal community or a "kingdom of ends."

Green here accepts the Kantian view that morality is grounded in terms of reason and especially the Kantian claim that the universalization principle connects rationality with morality. This connection makes a triple contribution to Green's idea of the common good society. First, "the idea of human equality" (PE, 209) accounts for the "principle of an absolute value in the human person as such ..." (PE, 215). That principle, in turn, underpins the relation of mutual respect in which each recognizes the equal status of another as a person. Second, equal human dignity gives rise to "a like claim to consideration in all men ..." (PE, 215) which grounds justice as the rule of conduct, namely "the duty of treating all men equally ..." (PE, 213) Third, universal reason is, for Green, a unifying, rather than, separating force. Thus, common rational human nature" (PE, 207) entails communication (PE, 209) which, in turn, creates community (PE, 201-202, 216), "potentially a community of all men ...". (PE, 216, emphasis in the original)

IV: The Kingdom of Ends Revised - The Hegelian Connection

The common good is the kingdom of ends revised. Green's revision, however, does not follow the standard Hegelian response to Kant though Green is greatly indebted to Hegel. Rather, Green's revision seeks "the vindication of Kant" (Kant, 124). One way to look at this revision is to view it as Green's effort to justify Kantian morality by situating his idea of reason, which Green does three times over: in sociality, in history and in human desires and interests. Accordingly Green "socializes", "historicizes" and "teleologizes" reason. Hegel looms large in the first two.

Relying on the Hegelian idea of mutual recognition he argues against Kant that autonomy cannot be achieved by acting on oneself, as it were, in isolation and independence as in the case of the Kantian individual. This recalls Green's separating "individuality" from "individualism" which underscores his analysis of self-realization. Whereas Kantian subjects are conceived of as selves by virtue of exclusion and standoffish relation, for Hegel subjects are never isolated atoms, but are always reciprocally related.[1] In their reciprocal relations subjects recognize themselves as mutually recognizing one another. This process produced a subject which is relational at its core [See below VII: Ontological Foundations]. Kant's view of the subject blocks the view of oneself as relational at the same time that it blocks an understanding of the relationship to the other as constitutive of the self. Green's point is that once the formative process of the "I" is rightly understood the Kantian view of the autonomous will is exposed as an abstraction from ethical relations. Ethical relations of reciprocity is, in Green's relational approach, the normative resource for autonomy as self-realization. Kant thought that it is enough to have the

capacity for autonomy; exercising it is not an essential part of having it. Green disagrees, a point he shares with Mill, both drawing on Aristotle: exercising one's capacities is essential for having autonomy; it can be achieved only by interacting with other human beings.

In addition to "socializing" Kantian reason, Green also, and relatedly, "historicizes" it. Although in both respects Green Hegelianizes Kant, he makes his debt to Hegel much more explicit in the second respect, praising Hegel for seeking "to find formula adequate to the action of reason as exhibited in nature and human society, in art and religion." (PP, p. 125) Green, however, employs that Hegelian formula to justify and complement, not to supersede, Kant.

Green first discerns the essential truth in Kant's position that "the true principle of morality is independent of experience," i.e. a priori. (Kant, 105) and then proceeds to justify it. The essential truth is that the term a priori does not mean antecedent to, or prior to, experience. Properly understood, Kantian a priori, according to Green, is "element in experience" (Kant, 105, emphasis in the original). The absolute moral laws are not product of experience in that they are non-sensuous, but are in and with experience.

If so, then revealing and tracing "the immanent operation of ideas of the reason in the process of social organisation" gains paramount importance and this in two ways (PE, 215). First, reflecting on the immanence of reason in the world of social institution Green finds embodied in them, however partially, the Kantian moral principles of human equality, of "the absolute value in the human person as such, of a like claim to a consideration in all men ..."(PE, 215) The history of reason proves the validity of the kingdom of ends as a practical and a social force.

Second, social institutions which embody those moral principles are, according to Green, "a school of character" (PE, 205). They

> habituate[s] the individual to the subordination of his likes and dislikes to social requirements, a sort of common language of rights, in which the idea of universal human fellowship, of claims in man as man ... can find expression necessary to its taking hold on the minds of men. (PE, 216)

Green shows how the Kantian principle of mutual respect for persons are learned and become habits of action. He further makes the point that taking seriously mutuality of respect for human dignity and autonomy needs situating in social context, "culture of respect," which can sustain and foster it.

Green further situates Kantian reason in human desires and interests. There are two related issues here, "teleologizing" Kant and correcting his "two-selves" conception of the self. It is usually held that Kant's morality takes seriously respect for people, but does not take the promotion of the good seriously enough. For Green, however, promoting the good, self-realization, which is the moral end of both the individual and society, is primary. And yet again, Green reads Kant generously only to discern the essentials of that position and then to support it from his own

resources.

"A law without an object is nothing at all" Green argues and this seems to be a serious flaw in Kant's ethics (Kant, 110; 109). But he further maintains that in the Kantian view of law "there is implied some relation to an object ... which motivates the will to obey the law, [namely] his account of man as an absolute end." However, and this is Green's addition,

> the presentation of the self as an absolute end ... is not a presentation of it as an empty and abstract self, but as an determinate self, as in certain state determined by relation to certain objects ..." (Kant, 118)

Green thus deeps into his own resources to brings out and complement the teleological elements which he discerns in Kant's ethics, which, he believes, survives its own deficiencies.

One such deficiency is Kant's "two-selves" conception of the person. Green is well aware that Kant defends "a false antithesis" (Kant, 119) in splitting the self between two radically different selves, the desirous, pleasure-seeking, egoistic self and the rational moral self. Kant fails to give a coherent account of how a person act morally or non-morally, autonomously or heteronomously because there is no point at which the two selves can meet. He cannot explain how a person act morally or autonomously since his notion of moral motives is empty in that they cannot move an agent to act. The source of moral action is reason but determination by reason is not determination by desires. The latter is the source of action of the sensuous, heteronomous self.

Green would agree that this dualism of practical reason is the principal problem in Kant's ethics. It is precisely the kind of dualism which Green believes cannot serve as a solid foundation for moral theory and which his theory of the common good strives to solve. And yet Green maintains that Kant's distinction between the good will (autonomous self) and the bad will (heteronomous self), which is "the basis of Kant's ethics" (Kant, 109) is indeed essential to ethics because it provides a "criterion of the moral value of our moral motives" (Kant, 120; PE, 154 ff.).

But how can such a criterion be justified given that it rests on the kind of dualism which fails to explain how a person acts morally? Green believes that the distinction between the good and the bad will can providing such a moral criterion. This is essential to ethics and can be preserved by grounding it in a unified view of the self which can give a coherent account of moral agency and of how a person acts morally. That is, Green identifies the essential truth in Kant's ethics--the good/bad will distinction--and justifies it by replacing its faulty dualistic foundation with a unified account of human action and agency.

We have seen earlier Green's view of self-satisfaction as the generic good accords unity to his view of person which overcomes the Kantian dualism (PE, 100, 130-137, 154-179; DSF, 13-16, 19-21; Kant, 91, 93, 119, 121). Green insists on the unity of human action. Determination by desires or motives is not natural

determination foreign to the rational individual as Kant would have it. Reason cannot be practical--set ends and furnish motivation to act for their realization--if it is independent of desires or motives. But reason, through critical reflection on one's desires, rejects or accepts them in accordance with one's conception of well-being, thereby according them coherence which supplies motivation for action. Thus, heteronomous, like autonomous, action is self determined (or free) in that it involves rational and not natural determination. Put differently, the will is always formally free. It is good or bad depending on the nature of the objects in which it seeks self-satisfaction or self-determination.

V: Aristotle - The Practice of Virtue

Whereas Kant needed a great deal of rescuing, Aristotle, Green believed, did not. This is because Aristotle grasped and formulated the nature of morality and the good in their final form (PE, 251-253). This claim is consistent with Green's criticism of "the comparative poverty of the Greek ideal," namely the exclusion of women and slaves from free citizenship (PE, 268). That poverty of the Greek ideal shows that the ability to grasp fully the moral ideal is constrained by the "actual structure of society" in which it is embodied (PE, 267). Partial embodiment of the moral ideal in Greek society is, however, not inconsistent with the claim that Aristotle once and for all conceived and grasp the nature of the true good as self-realization in its purest and complete form.

Green argues that Aristotle's true conception of the agent's good solves the dilemma of the dualism of practical reason, thereby buttresses and supplements his own conception of the common good. Green's argument can be reconstructed in four steps and bears much resemblance to his own account of the common good which I reconstructed earlier.

(1) The true good is self-realization.
(2) Self-realization is exercising one's capacities virtuously.
(3) Virtuous activity is for the sake of the fine.
(4) Virtuous activity for the fine connects up with the common good.

Let me explain the four steps. (1) The true good is self-realization. "Aristotle," Green maintains, "... could find no better definition of the true good for man than the full exercise or realisation of the soul's faculties in accordance with its proper excellence, which was an excellence of thought, speculative and practical" (PE, 254) Green adopts this view of self-realization with one qualification, namely he tends to emphasize the realization of the practical, moral faculties rather than the intellectual ones.

(2) Self-realization requires exercising one's capacities virtuously. Virtues are dispositions which are relative to the conception of the good the agent pursues, and are defined in reference to that good. Crucially, however, virtuous practices are related to the end of self-realization "not as a means to an external end," but rather

the end "itself included their exercise" (PE, 255; 254). That is, the interest in being and doing good for its own sake, which exhibits itself in virtuous practices, is constitutive of the good itself.

(3) "[T]he kalon [the fine] ... [Aristotle] considered to be the basis of the virtue" (PE, 263). Nancy Sherman puts it more clearly and adequately: Virtuous practice or activity is for the sake of the fine [kalon] insofar as it is praiseworthy and constitutes its own end. (Sherman 1989: 13)

Aristotle holds that the fine is the end of virtue, but not external end superimposed as a value over and above the value of virtuous action itself; the fine is an immanent end in that virtuous practice is its own end which, therefore, contrasts with acting for the sake of either expedience or exterinsic pleasure. This intrinsic value of virtuous activity is central to Green's understanding of the common good as well as, he believes, an important point which both Kant and Aristotle share. The point is that "pure morality," as Green puts it, rests "on what we may venture to call a disinterested interest in the good," namely interest in the good for its own sake (PE, 254). It is virtuous activity and the state of character of the agent engaged in it which is of intrinsic value, not, as the utilitarians hold, a particular state of affair to be brought about by virtuous character which is, therefore, only instrumentally valuable. Kant's claim that "the only true good is the good will" conveys the same point according to Green (PE, 240; 279). Kant's error, however, was that he held a too abstract view of the good will (PE, 262). We have seen that Green corrects that error by introducing a determinate view of the good will and the dominant interests in which it seeks habitual satisfaction. It can be said that this determinateness is supplied by Aristotle. The good will loses its abstractness when connected with specific virtues. Green says as much when he speaks of "the manifestations of the good will which the Greek philosophers presented to themselves." (PE, 279)

(4) Virtuous activity for the sake of the fine connects up with the common good, and this in two ways. (a) Fine activity, virtuous activity for the sake of the fine, is beneficial for others. (b) When all act in accordance with fine action (virtuously), they act on, and for, the common good.

(a) Fine activity, virtuous activity for the sake of the fine, is beneficial to others. This parallels Green's own claim that self-realization requires an interest in the good of others for its own sake which underpins the idea of mutual service. According to the Kantian version of mutual service, which Green adopts, mutual interest requires treating each others as ends only. The Aristotelian version of mutual service--virtuous activity--gives practical effect to the Kantian version while failing to recognize its universal application. That failure notwithstanding, Green claims that virtuous activity which is its own end successfully captures the idea of mutual service.

He illustrates his claim by analyzing the virtue of temperance (PE, 263). The virtue of temperance shows how the virtues connect the good of one with others. Temperance is the habit of the will which exercises control over the allurments of pleasure. Intemperance "issues a kind of self-assertion, and aggression upon the rights of others ... " (PE, 265); it issues, as Irwin explains, in wanton aggression which embraces not only physical and sexual assaults but also other attempts to humiliate

other people for our own pleasure or gain (Irwin 1992: 300) The intemperate person thus treats the humanity of others as mere means to his ends. By contrast, the "temperate man" displays equal service to one and others. By exercising self-restraint over his appetites and pleasures the "temperate man" is less aggressive and competitive and more co-operative engaging in "mutual helpfulness" (PO, 248).

(b) When all act in accordance with "fine action" they act on, and for, the common good. The following quotation captures that connection:

> ... to a Greek who was told that the virtue of temperance was a mastery over certain desires, exercised ... [for the sake of the fine], there would be the object in which a prevailing interest was to enable him to exercise this mastery. In his view it could only be reverence for the divine order of the state, such a desire to fulfil his proper function in the community as might keep under the body and control the insolence of overweening lust (PE, 263)

Reverence for the state provides the individual with reason for exercising temperance without which he cannot renders an effective "service to the state." The state, however, can provide reason for virtuous action only because it renders service to its members. It does so by being a "regime of equal law, the free combination of mutually respecting citizens in the enactment of a common good." Thus, citizens and the political community have duties towards each others which when they fulfill make up the common good society.

VI: Relational Liberalism

I began by saying that Green's liberalism is grounded in the idea of the common good and that the idea of common good is Green's solution to the dualism of practical reason. Green's idea of the common good as self-realization solves that dualism by defending a conception of the good as self-realization which ensures that practical reason is not fractured and that the main principles of human nature are not left asunder. The idea of self-realization ensures these results by presupposing a self which, unlike Kant's divided self, offers a coherent account of moral agency and moral action, and by postulating that the realization of the self cannot be obtain in separation and isolation from the realization of other selves. Self-realization of one person cannot be achieved by the exploitation, degradation or another's loss and requires that others become better off. The pursuit of self-realization is thus mutual service which goes beyond duty and interest, as well as self-love and benevolence.

We have seen that Green draws on Kant, Hegel and Aristotle in justifying and elaborating his view of self-realization as the common good. We have further seen that fully understood, the common good is "some sort of society." It is the sort that is constituted by relation of mutual service based on relation of mutual interdependence in which each recognizes the equal status of others as persons and one's dependence on others as "alter ego." Such social union excludes no one: it is in the interest of all

and all are interested in it.

The common good society both rests on and exhibits Green's relational approach to liberalism. Crucially, his relational approach seeks to overcome and go beyond dualism by postulating a unifying ground where the two sides are brought together, a point at which the two sides of dualism can meet and thereby lose their radical separation. (For instance, the desirous and rational selves as well as heteronomy and autonomy in Kant's dualistic conception of person and human action, and also self-love and benevolence in the dualism of practical reason).

The common good society constitutes just such a point of connection which carries Green's liberalism beyond the "tyranny of dualism" which has dominated the liberal/communitarian debate. The point of connection is the relation of mutual interdependence which underpins the relation of mutual service and mutual interest. That relation is the core of the common good and is the unifying ground which relate both rights and virtues, justice and citizenship as well as the unencumbered and situated selves and also individualistic and organicist models of social relations. Thus the ontological foundation of the common good and its normative consequences capture Green's relational liberalism.

VII: **Ontological foundations: Self and Society**

Sandel claims that the debate between communitarianism and liberalism "reflects two contrasting pictures of the self" (Sanel 1984: 5). He holds that the liberal view of the person was shaped largely in response to utilitarianism and draws heavily on Kant. The Kantian self is a choosing self, independent of desires and ends it may have at any moment. Rejecting this vision of an unencumbered self communitarians embrace a vision of a situated self who is not detached from its aims and attachments.

Walzer challenges the importance of this sharp opposition between the liberal and communitarian views of the self "for neither of these views can be sustained for long by anyone who goes beyond staking out a position and tries to elaborate an argument," and more importantly, he claims "the Central issue for political theory is not the constitution of the self but the connection of situated selves, the patterns of social relations" (Walzer 1990: 21). Walzer's first claim may be true, but stating it does not make the issue of the constitution of the self go away. Nor has it disappeared as a central focus of discussion as recent literature indicates.[2] As well, though the issues of the constitution of the self and social relations are separate they on occasion become intertwined and certainly tend to overlap. I shall discuss both.

If the sharp opposition between the situated and the unencumbered self cannot be sustained, as Walzer claims, it at least helps to identify what a sustainable view of the self would be. It would be, according to Green, a relational view of the self. This view presupposes a unified conception of the self which serves as a point at which the autonomous (Kantian) and social (communitarian) aspects of the person can connect. In Green's terms, the relational self is both Kantian and Aristotelian. As we have seen, Green's unified conception of the self is a response to Kant's divided self.

Because Green's autonomous self is not independent of desires, because moral motives of the self are not empty of desires, the individual is not independent of ends and interests. As Green claims, criticizing Kant, the self is not "empty and abstract self, but ... a determinate self ... determined by relation to certain objects" or by relation to certain "dominant interests" (Kant, 118; PE, 199).

Here Green brings Aristotle to bear on Kant. The identity of the self is defined not in terms of an abstract capacity of choice as prior to the person's conception of the good (Kant); rather, following Aristotle, Green holds that identity of a person is defined in terms of the person's conception of the good as self-realization which is expressed in virtuous activity.

But equally Green accepts Kantian morality of equal dignity as defining a person's identity, viewing each person as morally equal with all persons. The core identity of all persons as equal is due to "the rational nature common to all men" (PE, 207; 201-217, 280). In order to conceive the individual in such equality, all particular differentiating features must be abstracted from the person.

Green, then, defends a picture of a twofold (Kantian-Aristotelian) person: a person defines his identity through identifying with a particular conception of the good which is attached to a social position he occupies. But a person's identity is never entirely immersed into social positions (or resoled into a particular end at any moment). He has an identity behind, as it were, particular social positions and independent of particular ends. To put the same point differently, the Greenian individual is always situated. But he is doubly situated in both an ideal community--a kingdom of ends--and in a concrete social community. It is not that the two communities are entirely divorced. Following Hegel, Green believes that the ideal community gradually takes shape in the existing world of social institutions. The ideal community is in constant realization in social institutions and practices, but realization is never complete and a gap between the ideal and its embodiment is always a reality.

Herein lies the importance of the twofold nature of the relational individual. On the one hand, the self is not empty and abstract but determinate. Rousseau was wrong and Burke was right. Rousseau's "antithetical logic did not allow him to conceive that the very individuality which he hugged was unreal, except so far as generalized by the relations to others which custom embodies" (PP, 116). Burke was right in criticizing the resulting Jacobin "attempt to abstract the individual from his universal essence, i.e. from the relations embodied in habitudes and institutions which make him what he is; and thus to unclothe man, if it were possible, would be to animalise him" (PP, 116-117). In other words, "the self ... is from the first a self 'existing in manifold relations to nature and other persons'" (Kant, 124).

The identity of the self cannot be abstracted from social relations as embodied in "habitudes and institutions," but can, and should, be abstracted from particular social positions and ends. Only when it is recognized that all human beings, as such, are "all who can communicate as 'I' and 'Thou,'" and are thus members of one ideal universal society (PE, 209, 274, 285) which is "one society of equals" (PE, 280) can actual society which excludes some persons be criticized as falling short of the

common good society. Only when it is recognized that there are "equal claims in all men" (PE, 208) to have their capacities realized, can the inclusive nature of the common good society becomes practical reality "as it comes to be understood that no race or religion or status is a bar to self-determined co-operation in its fulfilment" (PE, 207; 267, 273-274). Further, being situated in the ideal kingdom of ends allows for distance from concrete society and even a sense of alienation from social positions which fail to give effect to one's lifeplan or even block it as the case with women in ancient Greek indicates. Recognition of such failure is necessary to motivate "an actual change in the structure of society" to remedy the failure (PE, 267).

Two points need stressing. First, implicit in Green's argument is a distinction between two kinds of abstraction: abstraction from particular social positions and ends and from social relations as embodied in practices and institutions. Green seems to claim that the identity of a person cannot be defined in abstraction from social relations, but should be defined in abstraction from particular social positions, and that the latter abstraction does not entail the former.

The second point is that Green's common good differs from communitarian common good. Herzog argues that the problem of exclusion of historically marginal groups is endemic to the communitarian project (Herzog 1986). Communitarians believe that there are certain communal practices that everyone can endorse as the basis for a politics of the common good. The trouble is that there tend to be historical practices which gain legitimacy by excluding some from membership. The above suggests that the problem of exclusion cannot be endemic to Green's liberal conception of the common good since it is inherently inclusive of all.

A final point. Benn and Gaus argue that to embrace such a double picture of the individual as presented here "certainly will be a puzzle" (Benn & Gaus 1983: 61). The reason is that they believe that we have here two, not one, picture of the individual. The two pictures--of an individual who is an independent agent standing apart from society and of an individual who is a member intimately tied to a social whole and sharing in common life--are rival pictures which are couched in two rival models of society, namely individualism and organicism. Within its own terms, Benn and Gaus argue, each model tells a perfectly consistent story of the relation of individual to society. The two stories, however, cannot be combined, and it does not seem misleading, according to the authors, that liberalism draws on two rival pictures of the individual, the individualist and the organicist.

Benn and Gaus have a case if they hold that different liberals draw on either the individualist or the organicist models of society. They are also right to the extent that the two models are defined as rival and mutually exclusive. Both cases, however, do not apply to Green's liberalism (and to new liberalism at large). For one thing, the aspect of standing apart from society does not presuppose, as we have just seen, an individualist model of society viewed as an aggregate of separate individuals. The Greenian individual cannot be abstracted from social relations as is evident from Green's criticism of Kantian individualism, but from particular social positions. Moreover, Green's relational approach propels him to connect the two rival models of social relations by trimming what he believes are the excessive claims of both. To

the extent that he succeeds in doing that, his relational model of society tells a consistent story of the twofold individual much the same way that the individualist and organicist models tell a consistent story of the independent and the integrated individuals.

Communitarians claim, under the heading of asocial individualism or atomism, that liberals misunderstand the relation between the individual and society or community. This claim embraces really two claims, methodological and substantive (Mulhall & Swift 1992: 13-18). Methodologically, communitarians argue that the contractual approach to political theory encapsulates the mistaken view that individuals form and adopt their ends independently and prior to society which is viewed as merely instrumental to given ends. Communitarians hold, by contrast, that individuals's self-understanding and conceptions of the good are parasitical on social practices which shape what individuals are and the value they have. Substantively, communitarians criticize liberals for fostering a view of society as an essentially private association, thereby ignore the possibility of communal goals and communal bonds which are valuable in themselves and not as instrumental to goals chosen independently of "shared way of life."

Methodologically, Green shares the communitarian criticism of the social contract approach to political theory though in its classical, not modern form (PO, 32-63). He criticizes the social contract approach on a number of counts, but the relevant criticism here is that this doctrine "begins with the supposition of an existence of human individuals unaffected by society" [PO, 42]. We have seen that he endorses Burke's rejection of that position. The individual cannot be abstracted from "the relations embodied in habitudes and institutions which make him what he is."

Green, however, regards that claim as it stands alone as one-sided unless complemented by the claim that "It is in turn, however, only through the action of individuals that this organisation of life is achieved" (DSF, 23; PE; 215-217; PP, 103-104). He insists on the mutual interdependence of social institutions and reflective individuals because he believes that one-sided insistence on the way the individual is parasitic on society for his self-understanding and the values he has runs the risk of playing up the passivity of the individual and downgrading the "constructive and free" nature of the individual; that is, the role reflective individuals play in creating and maintaining the social practices and institutions which shape their self-understanding and goals. (PP, 103-104, 113) While Green agrees that social contract approach to political theory tends to over-individualize the person (communitarian criticism of the unencumbered self), he is anxious to guard against the opposite error, namely the tendency of organicist approaches (of which communitarianism is a version) to over-socialize the individual.

This insistence on the mutual interdependence of individual agents and the world of social institutions rests on societal ontology that escapes the opposition of organicism and individualism. On the one hand, individuals are socially situated. "The fallacy of the statement 'a nation [i.e. society] is merely an aggregate of individuals' lies in the implication that the individuals could be what they are, could have their moral and spiritual qualities, independently of their existence in a nation ..." (PE,

184) But society lacks an independent ontological existence and therefore is not a separate entity with its own life and goals. Hence, "it is nonetheless true that the life of the nation has no real existence except as the life of the individuals composing the nation, a life determined by their intercourse with each other, and deriving its peculiar features from the conditions of that intercourse." (PE, 184; 183)

The basic ontological unit in Green societal ontology is neither a single social whole existing over and above individuals (or behind their backs) nor separate individuals existing as windowless monads. Rather, the basic unit is social relations, individuals in mutual interdependence. This relational societal ontology provides Green the background for the normative argument regarding the common good.

VIII: **Normative Consequences - Rights and Virtues**

The normative sphere of the common good society is that sphere which implements the relation of mutual interdependency as expressed in mutual service or mutual interest. The common good as the sphere of relation of mutual interest constitutes the point at which both justice and rights as well citizenship and virtuous activity can meet. That relation of mutual interest is the foundation of justice and rights not less than of citizenship and virtues. Put differently, if the common good is self-realization, then both rights and virtues are equally relative to that moral end which is also their unifying ground.

It follows that the opposition, articulated by Sandel and Taylor, between the politics of the common good (communitarianism) and the politics of rights (liberalism) ill-captures Green's liberalism. Far from being rival to the common good, rights, according to Green, are necessary conditions for its attainment. Important as rights are to Green's liberalism--he views the state as an institution for the maintenance of rights--his doctrine cannot be described as a rights-based theory. To so describe a moral theory it has to embrace fundamental principles postulating that certain individuals have certain rights. These principles are fundamental because their justification does not presupposes any other moral principles and because all valid moral views derive from them (Raz 1986: 193-194). Green's liberalism does not fit into this description (and, for that matter, nor does any strand in modern liberalism). The core of his liberal concern is the idea of self-realization understood as intrinsically desirable, and whatever role rights play in his self-realization-based morality, that morality cannot be describes as rights-based.

This further suggests that Green's liberalism does not rest on what Taylor calls the "primacy of rights," namely the moral view that individual rights have primacy over other moral notions like moral duties or virtues. For one thing, rights cannot be primary since self-realization is. Specifically, however, Green criticizes the idea of natural rights for failing to realize that rights are not separated from social duties. Regarding virtues, Green views rights as negative conditions for self-realization in that their presence does not secure self-realization since it requires certain action which flows from a certain character state of the agent; the exercise of virtues is, therefore, necessary too.

The mutual supportiveness of rights/justice and virtues/citizenship is what I would like to emphasize. But before I do, and since I have discussed virtues, a word on Green's conception of rights is in order.

Green's analysis of the nature of rights is propelled by his encounter with the natural right approach to political theory. He rejects the idea of natural rights because they express "a false notion of rights" (PO, 40). The natural rights approach views rights as powers only devoid of any social reference to the idea of common good, to membership in society and to duties to society. This triple social absence implies that the doctrine of natural rights rests on a triple mistake. First, it presupposes a non-teleological view of the person; second, it assumes that individuals are abstracted from social relations of reciprocal claim and recognition; thirdly, and connected with the doctrine of social contract, the natural rights approach fails to see that political legitimacy rests on the mutual duties of individuals and the state to each other. Crucially, the natural rights approach fails to see that much as the individual cannot be abstracted from social relations, so "there are no rights antecedent to society" (PO, 30) .

Not surprisingly, then, Green views rights, like virtues, as essentially social and accordingly speaks of "social rights" (PO, 179, 180 including note 1). "Social," however, does not mean "holistic" or "collectivist" or "organicist," but "relational" and is consistent with Green's relational view of societal ontology and of the individual.

Rights, then, "are constituted by that mutual recognition," namely of individuals recognizing each other as ends in themselves and depending on that recognition for that existence (PO, 139). Thus constituted rights possess two inseparable aspects: claims of individuals to have their capacities, or powers exercised and fulfilled and the granting of that claim by social recognition. Both claims and recognition rest on reciprocity of relations between individual members of society. Rights, therefore, give effect to the relation of mutual interest.

Green's analysis of rights as powers socially (or mutually) recognized has a similar revisionary force in liberal history of ideas which his analysis of positive freedom as the ability (or power) to make the best of ourselves has. Indeed, the two conceptions are not unconnected especially in light of the core idea of ability or power that both share. This, however, is not the present concern. For now, I need to make two points. One is that Green's re-defines rights in a way that helps dissociate liberalism from its individualist underpinnings. The other point is that, thus re-defined, Green's rights have an important role in giving effect to the common good society. And hence there is no tension, much less conflict between rights and the common good.

I said that the normative sphere of the common good society is that sphere which implements the relation of mutual service. It is here that the common good functions, via mutual service, as a criterion of judging and acting for both individual members of society and its institutions. Recalls that the common good requires, positively, that one's pursuit of one's good is beneficial to others too and, negatively, that no one should gain by another's loss. When both individuals and institutions act on these requirements the common good society obtains. For individuals to act on the

common good is to act virtuously and as citizens. For institutions to adhere to the requirements of the common good is to secure the principle of justice and equal rights which create a morally justified society.

Crucial to the making and sustaining of the common good society is the mutual dependence of the individual and institutional spheres without which the common good society can not become a reality. This means that citizenship is not viable without the positive support of social institutions, but institutions cannot carry their supportive role unless they enjoy the allegiance of their members. Implicit here is Green's analysis of Aristotelian common good. When all act virtuously for the sake of such activity, a practice understood as intrinsically valuable, the common good obtain in the shape of the citizens and the state rendering services to each other.

Because the social contract doctrine fails to account for and justify such relationship, it fails, according to Green, to provide an adequate ground for political obligation. The doctrine of social contract encapsulates "the assertion of rights apart from duties on the part of the individual" (PO, 51). The "counter-fallacy ... claims rights for the state irrespectively of its fulfillment of its function as securing the rights of individuals" (PO, 51). It is the function of the state in maintaining the conditions for self-realization, and not an idea of original contract which justifies the claim of the state on our obedience. "Here again the Greek theory, deriving the authority of government not from consent but from the end which it serves, is sounder than the modern" (PO, 62).

The end which the state serves is the self-realization of all its members. Yet again Green joins Aristotle. Green, however, departs from Aristotle on an issue of great importance to liberals, namely how should the state serve its end? Aristotle is clear: "the legislator must labour to ensure that his citizens become good men. He must therefore know what institutions will produce this result, and what is the end or aim to which a good life is directed" (Aristotle, p. 317). Green cannot accepts Aristotelian perfectionism:

> No one can convey a good character to another. Every one must make his character for himself. All that one man can do to make another better is to remove obstacles, and supply conditions favourable to the formation of a good character (PE, 332).

Green defends here a basic liberal position. It is that only free moral agents could reach their best and that it is not the business of the state to compel morality; only free persons can make themselves moral. Leading the good life should be led from the inside, not imposed from the outside by the state or anybody else (Kymlicka 1991: 12).

Contrary to the link communitarians forge between liberalism and subjectivism, Green is an objectivist. He believes that certain ways of life are more worthy than others. He holds that self-realization involves not just any choice but certain kind of choice and that some choices are better than others. Green, however, is an objectivist liberal. His objectivism does not commit him to hold, contrary to the frequent charge

that originates with Berlin, that there is a single way of life that is uniformly right for everyone (Simhony 1991) What Green holds is that there is one form of the good life, namely full realization of one's capacities. But this allows for a variety of lifestyles. Differently put: a worthy life is that which is expressed in the pursuit of "dominant interests" within the boundaries of the requirements of the common good. This means that the life of an artist is objectively more valuable than the life of a gambler (a pleasure-seeker), but it does not enable us to judge whether the life of an artist is more valuable than that of a social worker.

Acknowledging that only free persons can give themselves good character does not mean for Green that individuals must be shorn of their institutional settings. Institutions can contribute to ways in which, at optimum, introduce incentives and opportunities to the best practice of virtue and development of excellence of character. The role of rights and justice should be viewed against this background since they do not run counter the common good but are in its service. Serve they do by maintaining a "free society," namely "a society of really free men ... ('really free,' in the sense of being enabled to make most of their capabilities)" (PO, 248). The state serve its members by enabling them to make the best of themselves, by securing the external conditions which render possible leading one's life from the inside.

The service individual members render to the enabling state is expressed in "active interest" in the maintenance and promotion of the political community with which they can identify as inclusive of their well-being (PO, 122). Aristotle, Green holds, "regards the state ... as a society of which the life is maintained by what its members do for the sake of maintaining it ..." (PO, 39). This view of citizenship is essential to Green's project since he refuses to regard the individual member as "a passive recipient of protection in the exercise of his rights ..." (PO, 122). Membership requires the individual not simply to conform to the law, which would make one "only the loyal subject." Membership requires exercising "civil spirit" which Green expands "to cover all the forms in which the habit of will necessary to the maintenance and furtherance of free society shows itself" (PO, 248; 37). Being a "loyal subject" does not constitute active interest, but being an "intelligent patriot" does.

Two points need emphasizing. One is that Green, like Hegel, holds that patriotism is not just a matter of making great sacrifice in times of emergency; it is rather my knowledge--and acting on it--that I am fulfilled through my living in communion with other human beings. The second point is that the charge of substantive individualism leveled at liberalism by communitarians has no purchase here.

A final point. Only a free society, a society which "is so organised that everyone's capacities have free scope for their development," has a justified claim to receive the intelligent patriotism of its members (PO, 189). There is no getting away from the relational nature of Green's project. It teaches us that--contrary to communitarian claims--a viable politics of the common good has to take justice and rights seriously if it is serious about citizenship and virtuous practices.

Notes

Introduction

Injustices come in many forms, and history can provide ample illustrations of suffering inflicted on powerless individuals from socio-political sources. Injustices do not only happen to individuals. Injustices can affect a group. Certain groups feel the brunt of injustice more than others. Some afflicted groups receive the blows of injustice because of their group status. Those that suffer group harm make up the disadvantaged.

In this chapter, I focus on a particular type of injustice, namely, that experienced by disadvantaged social groups. The chapter addresses the following questions: What makes a group disadvantaged? Who are the disadvantaged? What should be done about the plight of the disadvantaged?

In this paper, I develop the factors that prove critical in determining which social groups qualify as disadvantaged. The three factors are: negative group identity; group harm; and powerlessness. An historical narrative combines the factors into a persuasive or nonpersuasive case, very much akin to how a claimant makes a case for suspect class, i.e.,

disadvantaged, class status before the courts. The framework for determining disadvantaged group status yields a coherent grouping of the disadvantaged along the dimension of race, gender, poverty, infirmity, and age. The framework turns out refined enough to draw out the differences between and within disadvantaged groups, thereby providing a means of determining which disadvantaged groups are the worse off. Overlapping groups, such as black females, prove to be among the primarily disadvantaged rather than as evidence of the overly cumbersome nature of an analysis of this type.

I

Disadvantaged Social Groups

While individualism has become indelibly etched on the political consciousness in the United States, groups, and not individuals, make up a large part of the actual political landscape. The same people who sing praises to individualism find themselves involved with and dependent upon groups (especially when they sing in a chorus). Individuals find it difficult not to belong to some group. The image of the rugged, independent individual, dependent on no one but himself, serves more as an image than as a reflection of reality. Groups exert a significant influence over individual behavior. Corporations, religious groups, groups for socializing, crowds---all these fit under the heading of a group---and all have considerable influence.

What, then, is a group? Ontology asks the question"What exists?" Do groups exist? From time immemorial theorists have waged an ontological

battle over whether or not groups exist with individualists holding that groups are nothing more than the collection of individuals and collectivists treating groups as entities in their own right. The ontological debate presupposes that theorists have a clear understanding as to how to define the term "group" in the first place. So, before even posing the ontological question, the first step is to decipher exactly what is meant by a "group." I shall conveniently avoid the complexities of the ontological problem and concentrate, instead, on the definition of a group.

Disadvantaged groups can be identified in terms of a complex interplay of three factors, developed below, negative group identity, group harm, and powerlessness-all of which require assessment and documentation within an historical narrative. Each factor will be discussed below.

A. Negative Group Identity

Do membership criteria, decision procedures, or formal organizational structures[1] define a social group? People join groups by becoming members of organizations that have some type of formal procedures. Examples include professional organizations, civic groups, political interests groups, etc.

Yet, a certain type of group called a "social group" can also be characterized in the opposite terms, that is, without any membership criteria, decision procedure, or formal organizational structure. A "non-structured group" seems like a contradiction since groups, by their very nature, appear as organized structures. Nevertheless, examples of unorganized groups come readily to mind: blacks, women, children.

---

1 Richard DeGeorge, "Social Reality and Social Relations," The Review of Metaphysics 37 (September 1983)

Unorganized groups play a critical role in a theory of injustice. Historically, unorganized social groups have felt the brunt of injustices. The unorganized character of most disadvantaged groups makes them more vulnerable to discriminatory attack. Organizational structure alone can help parry attacks on a group. Lack of organization can make the group all the more vulnerable.

Before providing examples of social groups, the labels used throughout the chapter need some sort of justification. I have largely followed the labels found in current case law because they represent one of the difficulties in even talking about disadvantaged groups: the attempt to avoid imposing a badge of inferiority through the labelling process itself proves problematic. The difficulty in finding labels that do not demean in some way or another shows the power that negative group identity holds over social construction. The disadvantaged groups themselves do not rejoice over the use of labels such as "blacks," "homosexuals," "the handicapped." They prefer more positive labels such as "Afro-Americans," "gays," and "the differently abled." Since I want to emphasize the negative aspects of group identity, I shall refrain from using the more positive classifications.[2] Now let us return to examples of social groups.

Blacks (or Afro-Americans) constitute an unorganized social group. Blacks, generally, do not voluntarily join a formally structured group called the "Blacks," even though a significant segment of the social group might join an interest group such as the National Association for the Advancement of Colored People. Yet, in a sense, many blacks do readily and positively

---

[2] Of course, I shall also refrain from using the most negative labels for disadvantaged groups.

identify with an unorganized collective and even participate in naming the social group. Blacks, Latinos, Native Americans, etc. often proudly assert their group affiliation. So, perhaps, at least, so far as this account is concerned, there is not any mystery behind a social group; a social group is, purely and simply, what members of the group define themselves to be. As the discussion below will illustrate the positive, self-identity analysis of a social group proves problematic.

To take one sophisticated example from the current literature, Iris Young, emphasizing positive group identity, defines a social group as " a collective of people who have affinity with one another because of a set of practices or way of life."[3] Young differentiates social groups from interest groups and from ideological groups. Interests groups, such as the National Rifle Association, aggregate around specific goals such as gun control and ideological groups, such as the Nazis, share political or moral beliefs, including anti-semitic and racist claims. While I am sympathetic to Young's analysis, the distinctions between social, interest, and ideological groups do not hold. Young's definition of a social group in terms of common practices lets in more groups than she wants. On Young's definition, despite her protestations to the contrary, the Klan qualifies as a social group.

Neo-Nazis and the Klu Klux Klan pose problems for any philosophy that emphasizes groups. These groups engage in activities that many find deplorable, to say the least. Nevertheless, they do make up a social group. It does not suffice to place them in only the ideological group category, as Young would. They qualify as social groups since they share cultural

---

[3] Iris Marion Young, "Social Movements and the Politics of Difference," in Justice and the Politics of Difference (Princeton: Princeton University press, 1990), p. 186.

practices as well as political and moral beliefs. The deep-seated cultural practices and even some liberal beliefs of the Klan have come to light in a recent study of women in the Klan.[4]

Moreover, social groups do not necessarily share cultural/social practices within the group. Wide diversity of practices exists among social groups. Women, for example, exhibit a healthy variety of cultural and social practices. Sub-groups within the classification may differ more from each other than they do from other groups, including rival groups, such as men. A "common way of life" does not adequately individuate social groups. It does not enable someone to tell the social groups apart. A stronger line of differentiation is needed.

A stronger principle of differentiation comes from negative and not positive group identity. Ironically, bigotry and its kin make the theoretical task easier. Blacks and women constitute distinct social groups, homogenous in their own right, because the external forces of discrimination, etc. treat them as such. Discrimination enables us to speak of large amorphous, unorganized social groups. External forces, not recognizing diversity, treat blacks and women as if they were homogeneous groupings. The identity that concerns a theory of the disadvantaged is negative identity.

Thus, social groups can take form externally and negatively. Larry May recognizes and emphasizes the negative dynamics behind some group formation in his definition of a social group: "if a collection of persons displays the ability to engage in joint action or to have common interests, then this collection of persons should be conceived as a group (emphasis,

---

[4] Kathleen Blee, Women of the Klan

mine)."[5] Blacks as a group can only loosely be said to engage in any kind of joint action. However, blacks do have a common interest, but the common interests generally do not generate initially from within the group but rather come in response to outside forces, from the Other. In a sense, the Other creates the common interests of blacks and similarly situated groups. Because of action by the Other individuals recognize themselves as a group. Individuals see themselves as having a common vulnerability. As noted by Owen Fiss, social groups are an interdependent entity such that the identity and well-being of its members are linked to the identity and well-being of the group.[6] A person identifies with the adverse treatment of other members of the group and thereby identifies as a member of the adversely treated social group. So, minimally, a disadvantaged group takes form through the operation of a negative group identity.

The Klan does not fit the negative group identity picture. The Klan qualifies as an ideological or as an interest group but not, on this analysis, as a disadvantaged social group. First of all, the Klan has a highly sophisticated organizational structure; disadvantaged social groups do not. The disadvantaged group takes form primarily in social and not in formally political ways. If subgroups within the disadvantaged group organize in some formal political fashion, it is almost always after negative group identity has already begun to unleash its forces.

Secondly, discriminatory forces did not initially form the group

---

[6] Owen Fiss, "Groups and the Equal Protection Clause," 5 Philosophy and Public Affairs (1976) 107, p. 147.

contours around the Klan. Those individuals who formed the Klan may have perceived themselves as victims of injustice. Whatever the nature of these so-called injustices, they did not stem from attacks directed against the group as a group. So, the dynamics of negative group identity can make considerable inroads into identifying the disadvantaged from other social groups.

I do not deny social group status to those collectives that form under conditions of positive group identity. To recognize the negative aspects of group identity does not entail a rejection of the positive aspects of belonging to a group. A powerful way of countering the negative forces of group identity may lie in the strategy of positively affirming group identity. The pride of Black power in the 1960's confronted the negative stereotypes inherent in racist thinking. A positive group identity can provide those suffering from group harm a more united front from which to confront the powerful. Groups, however, can have a powerful negative force that keeps them together in addition to this positive attraction.

Despite the allure of positive group identification for the disadvantaged, it would be wrong to confine social groups to only positive instances of identification. Some members of a group, such as some children from racially mixed marriages, may not want to be identified as members of the disadvantaged group, even though the dominant culture says otherwise. They may do whatever they can to identify with the dominant group. A person may well reject identification with a particular social group. Individuals may want to rid themselves of their group identity.

In her biographical study of Rachel Varnhagen, Hanna Arendt describes attempts to cast off group identity: "Jews did not even want to be emancipated as a whole; all they wanted was to escape from Jewishness, as

individuals if possible."[7] Perhaps individuals who deny their group identity suffer from false consciousness in not recognizing the positive virtues of their group identity. Nevertheless, the disavowal of group identity deserves recognition. Otherwise, insisting on group identity could result in group oppression by socially forcing group identity on individuals who do want it.

Some individuals may not appreciate their group identity. Others may welcome the group affiliation, but they may have to accept many harmful effects stemming from their group identity. This chapter focuses on the externally imposed negatives in the group identity situation-what the outsider does to make the group identity a burden. The burdening begins very early.

Group identity can attach as soon as an individual is born. A newborn baby acquires a number of classifications: gender, racial, normal/abnormal (physiology and mental functioning), etc. Obviously, the newborn has no say over the choice of categories. The involuntary nature of the classifications becomes problematic when the labels take on negative connotations. The fact that individuals can be born into a negative group identity makes the disadvantaged classification all the more insidious. Furthermore, in many instances the individual cannot readily shed her or his group identity. The identity sticks, becoming integral to the individual's persona. The group identifying characteristic or characteristics often appear so glaring and so permanent that they become immutable.

Immutability. Before going on to describe the remaining two features of a disadvantaged social group---group harm and powerlessness---the

---

[7] Hanna Arendt, Rachel Varnhagen: The Life of a Jewish Woman (New York: Harcourt Brace Jovanovich, 1974), p. 33.

concept of immutability provides a necessary pause in the analysis, since it inevitably arises in a discussion of negative group identity. In fact, the Supreme Court often identifies disadvantaged social groups through the immutable nature of the trait in terms of which one becomes a member of a social group, or, in legalese, a **suspect class.**[8] A trait is immutable if the individual has little or no control over having the trait. According to this account, racial characteristics constitute an immutable trait whereas alienage does not. A person cannot change her or his race, but an individual can become a citizen.

However, immutability does not constitute a sufficient condition for a social group. Eye color seems immutable, and yet the blue-eyed hardly qualify as a social group. Nor does immutability suffice as a necessary condition for a social group. The barakumin clearly subsist at the bottom of the Japanese social hierarchy despite the fact that they do not have any physical feature that would differentiate them from other Japanese. The barakumin look very much like any other Japanese person. The barakumin have a very mutable trait-a negative assessment of their lineage.

Even if immutability does not provide a sufficient nor a necessary condition for a social group, it still plays an important role in helping to assess group harm. In general, blacks suffer more group harm than members of a harassed political group because of the immutability of racial characteristics compared to the mutability of political affiliation. A person

---

[8] See Korematsu v. United States, 323 U.S. 214 (1943); Regents v. Bakke, 438 U.S. 265; San Antonio Independent School District v. Rodriquez, 411 U.S. 1 (1973). Sherry, "Selective Judicial Activism in the Equal Protection Context: Democracy, Distrust, and Deconstruction," 73 Georgetown Law Journal 89 (1984).

can change political affiliation with much greater ease than she or he can change racial characteristics. Immutability affects the ability to exit from the social group. Immutable traits help to facilitate the negative identity of a disadvantaged social group.

The harm stemming from an individual's inability to shed her or his immutable characteristic becomes more intractable because of the moral irrelevancy of the immutable trait. It is one thing to classify in terms of immutable traits for medical purposes and quite another for political purposes. When, as in Cleburne v. Cleburne Living Center, Inc.[9], a law discriminates against the mentally retarded by making it legal to bar them from a particular neighborhood, it implies a moral judgment that the retarded are lesser human beings, unworthy of living next door to the rest of us. Classifying the mentally retarded in terms of some list of immutable traits may have some medical validity, but it implies an incorrect moral judgment when placed in the housing context.

Summary. Negative, rather than positive, group identity provides the first step in constructing a theory of disadvantaged social groups. I have not fully described the forces that underlie the social construction of a negative group identity. At this stage, suffice it to say, the negative forces take on so much force that any person in the society would have little difficulty appending the group identity label to an individual.

B. Group Harm

No one can deny that harms befall individuals, but group harms seem rather mysterious. How can a group become harmed? Surely, the cynic would answer, groups like corporations do not suffer. Individual corporate

---

[9] Cleburne v. Cleburne Living Center, Inc., 473 U.S. 432 (1985).

executives may suffer but not the corporation. Similarly, a black person can suffer harm, as many have, without the social group being harmed.

Despite the cynics protestations, it does make sense to speak of group harm. Group harm occurs in a rather direct way when, for example, legislation specifically singles out a group and denies members of group a benefit or a public good. Virginia's antimiscegenation statute, which prohibited and punished marriages on the basis of racial classifications, denied one of the "basic civil rights," to a social group.[10] Not only were the individuals who attempted an interracial marriage harmed by this statute but the social group itself was harmed for it thereby limited the social choices available to blacks because of their group identity.

The law need not explicitly specify the group. It may appear neutral on its face but discriminate against a group in its application. For example, a San Francisco ordinance made it unlawful to operate a laundry except in a brick or stone building without consent of the board of supervisors. The ordinance did not discriminate against any one group, but in enforcing the law officials denied consent only to Chinese laundry operators who operated laundries in wooden buildings.[11] So, harm can befall a group in cases where laws either explicitly or implicitly pick out certain social groups for harmful treatment.

Group harm does not always manifest itself in clear-cut ways, where direct harms can be seen from the legislation itself or in applying the law.

---

[10] The Virginia statute was overturned in Loving v. Virginia, 388 U.S. 1 (1967).

[11] The Court found the San Francisco unconstitutional in its application, Yick Wo v. Hopkins, 118 U.S. 356 (1886).

Group harm can take a much more indirect route. Harm involves the infringement of an interest. We speak of group harm when a group member's interests becomes thwarted because of her or his being identified with the group. Harm to one member of the group carries over to the other members of the group in complex ways

In a recent attempt to bring philosophical order to the conceptual confusion surrounding discussions of groups, Larry May distinguishes unorganized groups like blacks from organized groups such as corporations, claiming that harms to unorganized groups distribute to the individual members whereas in organized groups they do not. So, according to May unorganized group harms are guaranteed to have wide scope.[12] May does not elaborate on how group harm spreads among the group members.

One plausible means of contagion involves the process of group identification itself. The very process of negative group identity constitutes a harm of sorts. When outsiders largely define the group in exclusively negative ways, and when membership in a particular group is not self-determined but other-determined, individual members are wronged. The wrong consists in denying individuals a prominent role in defining a significant aspect of who they are.

A theory of injustice focuses on the negative side of group identity. A subgroup within a group may try to insulate itself from the harm inflicted directly upon a member or members. The forces responsible for the negative social construction of the group's identity may or may not differentiate between the subgroups. Generally, the crude dynamics of negativity do not make fine distinctions. Even if other members successfully severed group

---

[12] Larry May, The Morality of Groups, p. 143.

ties, the harm against one member may make any other group member more vulnerable to harm.

More concretely, middle class blacks in the suburbs may successfully disassociate themselves, explicitly or implicitly, from racial incidents affecting poor blacks, confined to the urban ghetto. Nevertheless, a professional, middle class identity sheds quicker than the more immutable trait, skin color. Urban racial incidents can make middle class blacks more vulnerable to harm., for negative group identity continues to haunt them, sometimes in small ways:

> What a hollow victory we have won when my sister, dressed in her designer everything, is driven to the rear door of the luxury high rise in which she lives because the cab driver, noting only her skin color, assumes she is the maid, or the nanny, or the cook, but certainly not the lady of any house at this address.[13]

Sometimes racism follows the black middle class in more menacing ways as when a black person jogging through an affluent neighborhood becomes the object of police suspicion and intimidation. In any event, group harm can spread by lowering the threshold of protection of other group members.

Lowering the threshold of protection from possible harm pales in comparison to actual harm. Some members of a social group may experience group harm indirectly, through association with the group, and the harms they experience may look slight relative to those who directly experience

---

[13] Leanita McClain, A Foot in Each World (Evanston, Ill.: Northwestern university Press, 1986).

the brunt of group harm. Social group status may well subject a segment of the group to abject poverty.

Group harm is a relative concept. The harm suffered by one group needs to be measured against the harm accorded to its opposite social group. The disadvantage of homosexuality only becomes apparent relative to the privilege of heterosexuality. A theory of the disadvantaged needs to take into account the disparity between the privilege of heterosexuality and the harm perpetrated against homosexuals.

A theory of the disadvantaged must not only account for the disparity between a disadvantaged social group and its opposite, but it must also weigh the harms between the paired social groups. For example, the disparity between homosexuals and heterosexuals may be greater than the disparity between resident aliens and citizens. Homosexuals often face considerable hostility because of their homosexuality. In contrast, many aliens, particularly those with green cards, suffer fewer disabilities and little or no hostility relative to the status of citizens.

Group harms exist. Many European countries and, in at least one case, the Supreme Court of the United States recognize that not only individuals but also groups can suffer harm through, for example, libel. In Beauharnais v. Illinois[14] the Court upheld an Illinois statute that banned the distribution

---

[14] Beauharnais v. Illinois, 343 U.S. 250 (1952). Many do not regard Beauharnais as good law in light of the subsequent decision in New York Times v. Sullivan, 376 U.S. 254 (1964), where the Court announced that "libel can claim no talismanic immunity from constitutional limitations." Similarly, the Court in Smith v. Collin, 436 U.S. 953 (1978) refused to grant a stay of a lower court's ruling that found unconstitutional the ordinance attempting to block the march of the National Socialist Party of America through Skokie, Illinois, residence for some 5,000 Jewish survivors of the Nazi concentration camps. In Collin v. Smith, 578 F. 2d 1197 (7th Cir. 1978)

of literature that defamed a racial or religious group. The Court reasoned that "if an utterance directed at an individual may be the object of criminal sanctions, we cannot deny the State power to punish the same utterance directed at a defined group," even if no member of the group suffers direct harm.

Finally, group harm functions at a critical structural level. Group harm can exclude an entire group from any form of meaningful participation in the formal political activities as well as in other types of actions. Harmed groups effectively become non-citizens. The harms can deprive a group of citizenship.[15]

Hence, group harm, unfortunately, makes altogether too much sense.

C. Powerlessness

The unorganized nature of a disadvantaged social group makes it powerless from the beginning. The harms initially occur at the group level. This does not mean that the group must remain impotent in the face of the attacks. Disadvantaged social groups fight back, but the defensive posturing does not thereby rid the disadvantaged social group of its powerlessness.

Powerlessness does not necessarily correlate with political weakness, measured in terms of voting strength. The nonelectoral aspects of powerlessness must be kept clearly in mind. If power becomes correlated with electoral possibilities, then the democratic avenues for protecting

---

the lower court opined that the "approach sanctioned implicitly in Beauharnais would [not] pass constitutional muster today."

15 According to Karst, the principle of equal citizenship "forbids the organized society to treat an individual as a member of an inferior or dependent caste or as a nonparticipant." Kenneth Karst, Belonging to America, p. 3.

minorities are cut short. Blacks, women, homosexuals have different forms of electoral strength-blacks often exhibit solidarity at the polls, women have the sheer voting numbers, and homosexuals have strong interest groups. Placing too much emphasis on political power has the following result: Once a social group attains a certain degree of political clout at the electoral bargaining table, then the group no longer can wear the badge of "disadvantaged," which enables the group to seek special protection from the state.

To the contrary, the availability of electoral opportunity does not dissolve the disadvantaged status of a social group. Certainly, those social groups without political/electoral power, such as slaves, would qualify as disadvantaged social groups. Yet, the obverse does not hold. Electoral success does not readily translate into power, thereby freeing the social group from its disadvantaged status. A vote cannot completely loosen the tight and subtle grip of negative group identity, which operates in many dimensions simultaneously-language (labelling the social group as "queers"), social practice (shunning), cultural norms (the high culture of the dominant group versus the low culture of the disadvantaged one), substantive laws (Georgia's anti-sodomy law), procedural dictates (burden of proof in employment discrimination cases such that those making the complaint almost have to meet the onerous test of showing intent).

Disadvantaged social groups do not have political organizations that speak for the entire group. No one political organization represents the interests, especially those regarding negative group identity, of blacks, women, or homosexuals. However, simply because segments of the social group coalesce into interests groups does not thereby offset the overall powerlessness of the group. In fact, the political organization of one

segment of the group may actually divide the group, leaving a significant number still powerless while the others attain formal political power.

At its core, powerlessness manifests itself by stifling the modes of participation. Social group status, especially economic, can lead to powerlessness or enhance power, depending, of course, on the social group and its resources. Nothing does more to stifle participation than poverty. Those in dire economic straits find it difficult to participate in the political sphere, since politics requires just the resources they lack.

Most importantly, regardless of the particularities of its manifestation, powerlessness has a history, thereby creating a legacy that further reinforces the powerlessness of a disadvantaged social group. When members of a disadvantaged social group try to empower the group, they must face not only the current obstacles in place but also the historical legacy. Mobilizing around negative group identity creates a dilemma by emphasizing and thereby reinforcing some of the very stereotypes that lie at the heart of the problem.

D. Historical Narrative

Group identity, group harm, and powerlessness make up the elements of a disadvantaged social group, but they do not suffice, since they alone do not provide a context. The elements need development within an historical narrative.[16] The identity and powerlessness of a social group and the suffering of individuals within that group---all these factors are embedded

---

16 May, in an otherwise insightful analysis overlooked the need for a historical narrative. See Larry May, The Morality of Groups. The notion of a narrative gained a great deal of philosophical respectability from Alasdair MacIntyre, After Virtue (Notre Dame: University of Notre Dame Press, 1981), Chapter 15.

in a history. A social group has a history. A history of the social group does not simply provide some interesting tales, although the personal stories play a critical role in the narrative. Rather the historical narrative makes the social group's suffering intelligible, and it makes the case for the group's plight being made a matter of moral concern: "How we see the victims of racial discrimination, and how much of their humanity we recognize, is thus preordained by the historical legacy that once classified blacks as nonpersons and later attempted to rectify this evil."[17]

An historical narrative of group suffering has its dynamic, a dynamic that can submerge the individual's suffering into the sea of the larger historical picture. Frantz Fanon reveals the bondage of the historical narrative of racism:

> Am I going to ask the contemporary white man to answer for the slaveships of the seventeenth century? Am, I going to try by every possible means to cause Guilt to be born in minds? Moral anguish in the face of the massiveness of the past? I am a Negro, and tons of chains, storms of blows, rivers of expectoration flow from my shoulders. But I do not have the right to allow myself to be mired in what the past has determined. I am not the slave of Slavery that dehumanized my ancestors.[18]

Yet, social injustice arises in just those instances where the individual

---

18 Frantz Fanon, Black Skin, White Masks, p. 230.

victim cannot shrug off her or his historical identity.

Some histories of group struggles are well documented; others remain in a nascent stage. Still others reflect the pangs of attacks and distortions, as witnessed by recent attempts to deny the extent or even the occurrence of the Holocaust. None of the histories can claim objectivity in the sense of being beyond reproach. However, the historical narratives provide an intersubjective, robust documented account of group suffering. The forces of negative group identity force individuals, contrary to Fanon, to become mired in what the past has determined.

Personal stories play a particularly important role in making a case for the disadvantaged status of a certain social group. Their importance becomes highlighted by the fact that they effectively get overlooked and ignored. The legal system has many devices, e.g., rules of evidence, etc., that shut out the personal stories of the disadvantaged.[19] In contrast, an historical narrative seeks them out, for, paradoxically, group harm comes to light fully within the richly contextualized form of personal narrative.

As a story-telling animal, "I can only answer the question 'What am I to do?' if I can answer the prior question 'Of what story or stories do I find myself a part?'[20] Members of disadvantaged groups find themselves part of stories, both intimately personal and highly political. The history of a disadvantaged group is not the "history of a people with the politics left

[20] Alasdair MacIntyre. After Virtue (Notre Dame: University of Notre Dame Press, 1978) p. 201.

out," which is how G. M. Trevelyan defined social history.[21] A social history does not ignore politics. Rather it shows the complex interplay between the social and the political.[22]

The historical social/political narrative needs to make the case for negative group identity, group harm, and powerlessness. The narratives provide a catalogue of disadvantaged social groups. Not every candidate group can produce a persuasive narrative. White males, heterosexuals, Protestants, and, even today in the United States, Catholics will fail in any quest to fit under the disadvantaged banner through the development of a narrative.

The narratives provide something akin to a legal case, and yet they go far beyond the limits set by legal analysis. Narrative proponents must first show that the proposed group has a negative identity. Here the social history could run the gamut of evidence from discriminatory laws to personal anecdotes, giving witness to the stigma of inferiority. Adducing evidence for group harm follows, and, in some instances, overlaps the case for negative group identity. Group harm comes to light from anything from stories to health statistics. The focus on powerlessness delves into the group's reaction to the harm.

The narratives differ as to how successfully they muster support for negative group identity, group harm, and powerlessness. Many groups may not even pass the threshold of proving their group status. Others may

stumble at the group harm stage, garnering only enough evidence to show a past harm that has little or no impact on the present. Still others may have achieved a position of prominence and power in the society that defeats their claim to powerlessness.

Constructing an historical narrative has an important purpose. The success insures a demand for special protections from the socio-political structure at large. The stronger the case for disadvantaged status, the stronger the claim for the limited public resources used to offset injustices.

Which groups qualify, according to the analysis set forth above, as disadvantaged occupies the discussion for another paper.

ARISTOTLE'S DEFENSIBLE DEFENSE OF SLAVERY

by Peter Simpson

ARISTOTLE'S DEFENSIBLE DEFENSE OF SLAVERY

Peter Simpson

STATEMENT OF THESIS

There seem to be two dominant interpretations today of Aristotle's argument about natural slavery. Both say that this argument is unsound but one interpretation maintains that Aristotle, because of his inability to transcend his class or his age, thought the argument sound, while the other maintains, on the contrary, that Aristotle knew the argument to be unsound and indicated as much to careful readers. My own contention is that neither of these interpretations is correct because the argument is in fact perfectly sound. I demonstrate this contention in what follows by offering first a translation and division of the relevant chapters from book one of the *Politics* (with summaries in italics) followed, second, by a commentary on these chapters.

1) TRANSLATION

Chapter 4: Slavery.

The Definition of the Slave. *The slave is a species of property and property is tools necessary for living well. Tools are divided into those that are living or lifeless, and into those that are for making something with or for doing something with. Property is also what belongs wholly to another. The slave is therefore someone who belongs to another as a living tool for doing something with.*

1253b23 Property is a part of the household and management of property is part of household management (for neither life nor good life are possible without a supply of necessities), and the household manager needs his tools to complete his work properly just as is the case with any of the specialized arts.

1253b27 But tools are either lifeless or living, as the pilot's rudder, for instance, is a lifeless tool but his look-out man on the prow is a living one (for an assistant, as far as the arts are concerned, belongs to the class of tools). Accordingly a possession is a tool for the purposes of life, property is a multitude of such tools and the slave is a living possession. Further, every assistant is, as it were, a tool using other tools. For suppose that each tool could complete its work either by being told to do so or because it perceived what was to be done in advance, as those of Daedalus are said to have done, or the tripods of Hephaestus which the poet says "self-moved entered the divine assembly."[1] Then if shuttles could in the same way do their weaving by themselves or if picks could thus play the lyre, master-craftsmen would have no need of assistants nor masters of slaves.

1254a1 Tools as ordinarily spoken of are for making something with but a possession is for doing something with (we get something else out of using a shuttle besides the use of it, but from clothing or a bed we get the use only). In addition, making and doing are specifically different and so their respective tools (and both need tools) must be specifically different also. But a way of life is doing, not making. Consequently the slave is an assistant in matters that concern doing.

1254a8 We speak of a possession in the same way that we speak of a part. A part is not only

[1] Homer *Iliad* xviii 376. Daedalus was a sculptor whose statues were so lifelike they seemed actually to move.

part of something else but also wholly belongs to that something else, and the same is true of a possession. Consequently the master is only master of the slave but does not belong to him, while the slave is not only slave of the master but wholly belongs to him as well.

1254a13 The nature or capacity of a slave is thus clear: anyone who, while a human being, does not by nature belong to himself but to another is by nature a slave, and that human being belongs to another who, though human,[2] is a possession and a possession in the sense of a tool that is separate[3] and for doing something with.

Chapter 5: Slave and Master by Nature.

First Proof. *There are two ways to answer the question whether anyone is by nature a slave, the first by appeal to what happens in nature, and the second by formal argument. As regards the first these facts must be noted: that rule is something necessary and beneficial, that it is found naturally among things, that it comes in several forms, and that some forms are better than others. Nature provides illustrations of these facts in the political rule of intellect over desire and of male over female, and in the despotic rule of soul over body and of humans over animals. But those humans whose best work is the use of the body are as body to soul and as animal to human; hence they are also fit for despotic rule and slaves by nature.*

1254a17 The next thing to investigate is whether or not anyone is by nature of the sort just described and whether serving as a slave is better and just for anyone or whether instead all slavery is against nature. But it is not hard to see by argument what the answer is nor to learn it from what actually occurs. For (a) rule and subjection to rule are not only necessary but beneficial; (b) in the case of some things a separation of them into ruler and ruled occurs as soon as they are in being; (c) there are many kinds of rulers and ruled subjects; (d) rule over better subjects is always better (as rule over a human than over an animal), since from better materials comes a better work and there is always some work involved when one thing rules and another is ruled.

1254a28 For in everything that is fashioned into a common unity from the combination of several parts, whether the parts be continuous or discrete, a ruling and a ruled part can be found. Living things get this characteristic from the whole of nature (for rule exists even in lifeless things as in the case of harmony -- but that is an extraneous topic). An animal is in the first place compounded from soul and body where by nature the former is the ruler and the latter the ruled. But what is natural must be looked for in things whose disposition accords with nature and not in things that have been corrupted. Hence in the case of human beings we must look at those who have the best disposition both in body and soul since what is natural will be clear in them. For in those who are bad or in a bad condition the body often seems to dominate the soul because their condition is evil and against nature.

1254b2 But it is possible, as we say, in an animal first of all to see both despotic and political rule, for the soul rules the body with despotic rule and the intellect rules desire with political or royal rule. Here it is manifestly natural and beneficial for the body to be ruled by the soul and for the passionate part of the soul to be ruled by the intellect (the part that possesses reason). But all of them are damaged together if rule is shared equally or reversed. The same holds true

[2] Reading *anthrōpos* (human being) instead of *doulos* (slave) with Dreizehnter (the mss. give both readings).

[3] Separate from his master unlike the hand of i 2 which is not separate but must remain attached to the whole.

of human beings with respect to the other animals. The tame animals are better than the wild ones and it is better for the former all to be ruled by humans since their preservation is thus secured. In addition the relation of the male to the female is that of better to worse and ruler to ruled.

1254b14 The same distinctions must hold of human beings generally. So those human beings are slaves by nature who are as widely separated from others as soul and body are or human and beast, and that is the condition those are in whose work is the use of the body and from whom such work is the best that can be got. In their case it is better to be ruled over by a master, if indeed it is also better in the case of the things just mentioned.[4]

Second Proof. *The same result follows from the argument that those whose best work is the use of the body are (following the definition from chapter 4) living tools belonging to another. Such persons do not have reason of themselves (so belong to another) but can nevertheless perceive it and be of assistance after the manner of animals (so are living tools). This condition is a condition of soul but nature also tries to duplicate it in the body. All would concede slavery and mastery to the inferior and superior in body; much more justly should they do so to the inferior and superior in soul.*

1254b20 For the slave by nature is someone who has the capacity of belonging to another (which is why in fact he does belong to another), or someone who shares reason sufficiently to perceive it but not to have it. For the other animals give of their assistance without perceiving anything by reason but rather by what they feel,[5] and also the need we have of the two is very much the same since bodily help in the supply of necessities is got from both slaves and tame animals alike.

1254b27 Now nature wishes to make a difference also in the bodies of free and slave, with those of the latter strong for necessary tasks and those of the former erect and useless for such labors but useful for political life (a life that is divided into the needs of war and peace).[6] Often, however, the opposite happens and some have the bodies of the free while others have the souls. But however that may be, it is manifest that if some people were to develop bodies like the statues of the gods everyone would say that those left behind deserved to be their slaves. So if in the case of bodies this distinction is drawn, it would be much more just to draw it in the case of souls. But beauty of soul is not so easy to see as beauty of body.

1254b39 It is manifest then that by nature some are free and others slaves and that service as a slave is for the latter both beneficial and just.

Chapter 6: Slave and Master by Law

Against Those Who Altogether Condemn Slavery. *Those mentioned at the end of chapter 3, who condemn slavery as wholly unjust, are only partly right because they confine attention to*

[4] The body and animals, for which despotic rule by the soul or by humans is better as stated above.

[5] There is some dispute about the Greek here and translators tend to take it as meaning that the other animals do not perceive or follow reason but rather their passions. But such translations treat the text as drawing a distinction between slaves and animals whereas Aristotle has just likened the two to each other and should clearly want to continue the likeness here. The translation I offer is meant to overcome this difficulty.

[6] Cf. vii 14, 1333a30-b5.

slaves by law and ignore the fact and significance of slaves by nature. They use an argument that might succeed in a popular assembly but which misses the main point, evident to wiser heads, that superiority in virtue justifies rule.

1255a3 That those who have contrary opinions are right up to a point is not hard to see for 'slave' and 'slavish service' have two meanings and there is also 'slave' and 'slavish service' by law.[7] The law in question is a certain agreement by which what is conquered in war is said to belong to the conquerors. Now many of those versed in the laws bring against this principle of justice a writ of illegality as they would against an orator in the assembly.[8] Their supposition is that it is a terrible thing if whatever is forced into submission is to become the slave and subject of whatever has the capacity to use force or is stronger in power.

1255a11 There are some also among the wise who hold this view though others of them think differently. The cause of the dispute, and what makes their arguments overlap, is that when virtue gets hold of equipment it both has a special capacity to use force and also the conqueror always excels in a form of goodness. Consequently the force used seems not to be without virtue and the dispute seems to turn only on the principle of justice itself. Hence some think the principle is kindness while others think it reduces to this alone, rule by the stronger. At any rate when these arguments are set aside the other arguments, that the better in virtue ought not to rule and be master, are neither strong nor plausible.

Against Those Who Altogether Approve Slavery. *Those who hold the contrary position that all slavery is just face the unpalatable consequence that even those who do not deserve to be slaves should be enslaved if conquered. Their attempt to confine slavery to barbarians is a step in the right direction but is not wholly correct as it ignores the defects of nature.*

1255a21 Some take their stand wholly by a sort of justice, as they conceive it (for the law is in a way just), and lay down slavery in war as just, but then they immediately go on to deny it. For it need not always be the case that the rule won from war[9] is just and no one would say that he who did not deserve to be a slave really was a slave. Otherwise those reputed to have the noblest birth will be slaves and descended from slaves if captured and sold. Consequently they do not wish to give the name of slave to such persons but only to barbarians. Yet in so doing they are looking precisely for the slave by nature that we started with, for they have to say that some are slaves everywhere and others nowhere.

1255a32 The same is true of good birth. For they think of themselves as possessing good birth not just among themselves but everywhere, while the barbarians they think of as possessing good birth only in their own home, thus adopting the view that one of the two is simply speaking well

[7] That is, as well as by nature.

[8] In the popular assembly at Athens a charge of illegality (*paranomōn*) could be brought against anyone who proposed a law contrary to existing law. The phrase "principle of justice" translates *to dikaion* ("the just") in the Greek, which Aristotle seems to use several times in this passage to refer to the law in question.

[9] Most translate this as "the beginning of wars" (the Greek *archē* can mean either beginning or rule). But that the beginning of certain wars might be unjust is not what accounts for the possibility that some of those conquered might not deserve to be enslaved. For even if a war began justly the conqueror could not justly enslave the conquered unless these were already and independently slaves by nature. Besides what is relevant to Aristotle's argument is not how wars begin but how they end, namely what one does with the conquered after one has won rule over them.

born and free while the other is not. As Theodectes' Helen puts it: "who would dare call me servant, sprung as I am from divine roots on both sides?"[10] But to say this sort of thing is to give a definition of slave and free, good birth and low birth, in terms of virtue and vice since it is to claim that the good are born from the good in the same way that humans are born from humans or beasts from beasts. To be sure, nature has such a desire but she is seldom able to realize it.

Summary. *The dispute about slavery has some justification because the enslaved and the free by war need not always be slave and free by nature. But sometimes they are and in such cases (as shown in chapters 4 and 5) slavery is beneficial and just and involves a form of friendship, though the reverse is true otherwise.*

1255b4 So it is clear that the dispute about slavery has some basis to it and that some slaves are not by nature slaves and some free not by nature free. It is also clear that in other cases a natural distinction does obtain where it is beneficial and just for the one to be slave and the other master. Here the first should be ruled by the second with the rule for which the second is naturally fitted, namely mastery. But if mastery is exercised badly it is harmful to both of them, for part and whole, body and soul, are benefitted by the same thing and the slave is a part of his master as a sort of living but separate part of his body. Consequently mutual benefit and friendship arise between master and slave when they deserve by nature to be master and slave, but the opposite happens when their relationship is not natural but a result of law and force.

2) COMMENTARY

Chapter 4: The Definition of the Slave

1253b23 This chapter is all about property because that slaves are the property of their masters is evident and not in dispute (the dispute is about whether anyone should be a slave, not about whether slaves, if they exist, are property).[11] Three points are made about property relative to the slave: that property is tools for life; that tools fall into two divisions; that property belongs wholly to another.

Property is tools for life because it does for household management what tools in general do for any art: they enable it to complete its work. But the work of household management is the life of the members of the household (including good life, for living is for the sake of living well and life in the household is for the sake of life in the city). Hence property is the tools needed for such life.

1253b27 The first division of tools into the living and lifeless might seem questionable, or even offensive, in its implication that assistants are living tools. But all that can be meant in the context is that the job of an assistant is the same as that of a lifeless tool insofar as both assist the artist to complete the work. Since a slave is manifestly alive as well as property, he is a living tool for the purposes of life. But note that Aristotle does not say tools for the purposes of life are property; he only says property is tools for the purposes of life.[12] Some such tools

[10] Fr.3 Nauck. Theodectes was a tragic poet of the fourth century.

[11] Schütrumpf correctly (1991) i 242-243.

[12] Schütrumpf (1991) i 239, but against Barker (1959) 362.

will presumably not be property (as perhaps the look-out man). But that slaves are property is given.

The precise function of such living tools, and why we need them, is illustrated by the statues and tripods of Daedalus and Hephaestus. Living tools make up for the fact that lifeless tools are not robots; they would not be needed if robots existed.

1254a1 Two arguments are given to show that property falls into the second member of the second division of tools, namely into those for doing something with and not into those for making something with. The first is that typical pieces of property (beds and clothing) are tools for doing something with; the second that a way of life (for which the tools of property exist) is doing, not making. Hence slaves, as living property, must be assistants with respect to doing something.

What is curious about this conclusion and about the arguments on which it rests is that they seem to exclude productive tools, or tools for making, from the category of property and seem to deny to slaves any role in making. Yet productive tools are presumably the property of someone and slaves can sometimes be employed in making things (as in cooking food, i 7). Part of the explanation must be that Aristotle is speaking only of property as it belongs to household management and is of direct use to life. So he excludes tools and activities that are not part of this even if they produce what is part of this (as shuttles that make the clothes we wear). But it would also seem that he does not exclude these other tools and activities altogether, but is only subordinating them. He is defining property and slaves rather in terms of their end than in terms of all the possible activities that lead to this end.[13] So since making is for the sake of doing, making and its tools will be reduced to doing because doing, if not the immediate end of making, is its ultimate end (products are made in order to be used). Consequently slaves and property in general will have doing, or living well, as their point even when or if they are used in making something.

1254a8 A part, *qua* part, belongs altogether to the whole and property, *qua* property, belongs altogether to the owner, for to the extent they cease to be *of* the whole or *of* the owner they cease to be part or property. So the slave, *qua* slave, must also be altogether *of* his master. 'Master' and 'slave' are evidently correlative terms in the sense that they are predicated with respect to each other, but Aristotle does not want us to suppose that the beings they signify exist only with respect to each other. The slave indeed exists after this fashion for the slave is property, but the master does not. The master is always something other than a master (he also rules politically and royally, not just despotically, and in the city as well as the household); but a slave is never other than a slave. This conclusion is not altered by the fact that the master depends on the slave for survival,[14] for the manner of this dependence is not the same. The slave altogether depends on the master but the master only depends on the slave to satisfy material needs, and just as the tool in the case of the arts exists for the craftsman who uses it and not *vice versa*, so the slave also exists for the sake of the master who uses him and not *vice*

[13] Schütrumpf (1991) i 241 and Pellegrin (1982) 355-356.

[14] Against Schütrumpf (1991) i 244.

versa.[15]

1254a13 The concluding definition picks up on the three points made about property, that the slave is a tool, concerned with doing, and belonging to another. One peculiarity is that Aristotle shifts in his wording from "nature of a slave" to "by nature a slave." The shift may be explained in that to be by nature a slave seems simply to mean having the nature of a slave, and conversely. So if he is by nature a slave who is by nature of another and a tool for life, then to have the nature of a slave is to have the nature of belonging to another as a tool for life, a result which now accords with the earlier remark that everything gets its definition through what it does and is capable of (1253a23). For the slave has thus been defined through his capacity of being a tool belonging to another, and it is by reference to this capacity that Aristotle finds the slave by nature in the next chapter.

Chapter 5: The Slave and Master by Nature
First Proof

1254a17 The questions of nature, goodness and justice naturally go together. To be treated according to one's nature, or what one really is, must be just for thus one receives one's due, and to be treated justly is manifestly good. The remark about seeing the answer "by argument" and learning it "from what actually occurs" suggests Aristotle intends to prove his answer in two ways, but it is not altogether easy to find what these two are or where one begins and the other ends.[16] Since, however, it is a regular habit of Aristotle's to take a list in reverse order we may conjecture that the second comes first. Learning from what happens would then refer to the discussion of the kinds of rule to be found in nature and hence also to the analogy Aristotle draws, on the basis of that discussion, between these kinds and the slave by nature. Seeing the answer by argument would then refer to what he does immediately thereafter when in fact the process of his reasoning makes a shift back to the definition of the slave in the last chapter. A confirmation of the conclusion just drawn is then given by reference to that definition.

The four assertions are all illustrated by examples later but d) is immediately defended with an argument (it is perhaps less obvious): ruler and ruled have some work; the work from better materials is better; therefore rule over better subjects is better. The second premise here is uncontroversial enough, but the first premise must be read as meaning that the work of ruler and ruled is the point or essence of ruling (so that rule is better as the work is better), and that this work is completed from the ruled as material by the ruler as agent. Such a reading is, however, plausible enough. The purpose or aim of a ruler is to direct the ruled to achieve something (as victory in the case of a general ruling an army), and in this task the ruler is manifestly agent, as the one directing, and the ruled manifestly material or patient, as the one directed.[17]

[15] Hence there can be no slave/master dialectic for Aristotle as for Hegel (*Phänomenologie des Geistes* IV A), since for Aristotle, though the terms are correlative, the beings which the terms signify are not, but that of the slave only.

[16] Newman (1887) ii 140, Schütrumpf (1991) i 250.

[17] Aristotle elsewhere expressly says that subjects are the matter that rule fashions (1325b40-26a8; *Ethics* 1102a7-12).

1254a28 The general thesis that in everything fashioned into a unity from several parts a ruling and ruled part can be found introduces the examples that illustrate the assertions. The examples are all of continuous or discrete things fashioned into a unity where rulers and ruled of the sort just mentioned are manifest. Consequently, as Aristotle later argues, the same must hold in all similar cases (and specifically in the case of slave and master).

Aristotle's attention is of course on living things but as his assertions about rule, if true, must apply universally he mentions rule in inanimate things also. By harmony he presumably means either sounds in music, where the key note rules and determines the others in the scale, or elements in physics, where what rules is the principle of the mixture or the form. His examples in the case of living things are two from continuous unities (soul and body, intellect and desire) and two from discrete ones (humans and the other animals, male and female). The warning that what is natural must be looked for in things whose disposition accords with nature is evidently necessary because if we were merely to count up cases and not distinguish the natural ones from the corrupted ones we might not come up with any consistent result, and certainly not one that is by nature.

It is a striking implication of this warning, and one that Aristotle immediately accepts, that the best must be the guide to nature and not nature to the best. Yet, properly considered, he is saying only what we ourselves implicitly admit in our own scientific study. For like him we do not think it possible to understand a thing's nature properly from specimens that are spoiled or ruined. The best in the case of human beings must be the virtuous so that to understand what is natural here must first require an understanding of virtue. But this consequence merely confirms the dependence of the *Politics* on the *Ethics* and the need for the students of both to be well trained in their habits (*Ethics* 1095a2-11, 1095b4-13). Those not so trained could hardly be expected to recognize or admit the naturalness and goodness of soul's rule over body or intellect's rule over desire.[18]

1254b2 The soul's rule over the body will be despotic because the body belongs wholly to the soul and is its tool for the sake of life (the defining marks of the slave). Desire, however, does not belong wholly to intellect nor is it simply an instrument for something else. On the contrary it shares itself in the end, namely in moral virtue. So it is free and no slave. But it shares in the end only when ruled by intellect, and this rule, since it is over something free, cannot be despotic (*Ethics* 1102b13-03a10). Aristotle says the rule is political or kingly for the intellect rules desire permanently (at least in the virtuous) and as over an inferior, not over an equal (rather in the way, one supposes, that the man rules the woman or the father the child, i 12; cf. also 1333a16-24).

Obvious instances in the case of rule over animals would be oxen, dogs and horses, all of which are used by humans for various kinds of labor (as ploughing, hunting, riding), and all of which are better preserved and cared for as a result. That such animals might also sometimes be killed for food is not relevant in the present context, which is not about eating but about ruling. The distinction between tame and wild helps further to show that this kind of rule is according to nature and advantageous. For if tame animals are better, and if it is better for them

[18] Simpson (1992).

to be ruled by humans, then rule by humans is better and advantageous simply. Tame animals are presumably better because what is not savage and follows reason (the reason of its master) is better than what does not. Rule over animals must also be despotic, since tame animals, like slaves, belong wholly to their owners and are tools for the purposes of life.

The superiority of male to female is simply asserted as evident to experience (the experience we have of other animals presumably, as well as of ourselves), and one can see readily enough what Aristotle must mean. For that males dominate females is the experience of virtually all times and places, our own as much as Aristotle's. But if this dominance were unnatural and females were by nature as fit to rule as males, then, since the natural is what happens always or for the most part,[19] one would expect to find females ruling males as much as males ruling females. But one does not find this, hence the dominance of males over females, and so their superiority with respect to rule, must be natural (an account of why it is natural is offered later, 1260a10-14).[20] The rule of male over female is, of course, not despotic (except among barbarians, 1252a34-b7); it is political (i 12).

1254b14 The examples sufficiently illustrate the four initial assertions and the general thesis about ruler and ruled being found in things united from several parts. Hence, to apply the thesis, wherever the like differences are found as in the examples, there also the like kinds of rule will be natural and good. Consequently slaves by nature, for whom slavery is good, will be those who are to others as body is to soul or as animals are to humans (the two patterns of despotic rule). But those whose best work is the use of the body will be on the same level as animals and the body, which give no better work to humans or the soul; hence they will stand in the same relation of despotic rule.

Second Proof

1254b20 That this conclusion is correct is confirmed now by a more formal argument that appeals back to the definition of the slave in chapter 4. The argument, I take it, is the following: those who by nature belong to another as living tools for the needs of life are by nature slaves; those whose best work is the use of the body by nature belong to another in this way; therefore they are by nature slaves. The second or minor premise here is, I also take it, meant to follow from the idea that those whose best work is the use of the body cannot, as such, have reason of themselves but must follow the reason of another (if they did have reason of themselves then presumably they would be capable of some better work than the use of the body).

So, to apply this analysis to Aristotle's actual words, he speaks, evidently as regards the first part of the definition, about the slave's "capacity of belonging to another," a phrase that must have the force here of "incapacity of belonging to oneself" (someone who could belong to himself would doubtless by that fact cease to be able to belong to another). The following

[19] A cardinal thesis of Aristotle's, e.g. *Physics* ii 8, 198b34-36.

[20] Of course one standard objection to Aristotle would be that the experience he is appealing to is relative to culture and so only tells us something about culture and nothing about nature. But one may note, on Aristotle's behalf, a certain difficulty with this objection, namely that things manifestly relative to culture vary from culture to culture, whereas the dominance of male over female is invariant across cultures (including our own); accordingly it would seem to reflect nature instead.

remark about sharing reason "sufficiently to perceive it but not to have it" will then be introduced in explanation of this point. For those who lack reason must certainly be such as to belong to another, since to have reason of oneself is the mark of self-possession as enabling one to rule oneself by one's own thought and deliberation. Conversely, not to have reason makes one subject to those who can do the thinking and deliberating in one's stead (which, as chapter 2 already pointed out, is the job of the master with respect to the slave).

But Aristotle expresses himself in a complicated way. He does not simply deny reason to slaves; he allows they share in it sufficiently to perceive it. This further point is, I take it, related to the other part of the definition of the slave, namely that they are living tools which, unlike lifeless ones, are supposed to act by perceiving and obeying the mastercraftsman's commands. The problem is to see what such sharing in reason amounts to or how it can be that what does not have reason can nevertheless perceive reason.

Here a difficulty arises for the Greek of the next sentence (*ta gar alla zōa ou logō aisthanomena alla pathēmasin hupēretei*) admits of more than one interpretation. Some translate: "for the other animals are subservient not to reason, by perceiving it, but to feelings." Others read *logou* instead of *logō* (an alternative given in some manuscripts) and translate: "for the other animals do not perceive reason but follow their feelings." Others choose instead to omit *aisthanomena* and translate: "for the other animals obey not reason but feelings." Other translations are similar to these. But all of them agree in taking this remark as drawing a contrast between slaves and animals. For they all take it as saying that animals follow their feelings in a way that humans who are by nature slaves do not. This interpretation, however, does not seem right. For, to begin with, Aristotle's first proof has just rested on likening slaves to animals so it would be paradoxical if his second proof were to rest on distinguishing them. Further, animals are evidently also living tools that do what their master wants by perceiving and obeying his commands (think in particular of sheep-dogs and horses). So it would make more sense to suppose that Aristotle is appealing to the perception of animals at this point in order to show how the perception of slaves is the same as theirs instead of different.

My proposed translation ("for the other animals give of their assistance without perceiving anything by reason but rather by what they feel") is meant to give the sense that Aristotle's reasoning seems to require. What is distinctive about it is that it takes *hypēretei* in its primary meaning of giving assistance (thereby recalling the word for the living tool, or assistant, *hypēretēs*, in chapter 4), and as an independent verb, not as governing *pathēmasin*. This word is instead, like *logō*, made to depend on *aisthanomena*. The resulting advantage in terms of Aristotle's reasoning is that not only is there a neater connection with chapter 4, but also the remark can be read as likening slaves to animals in the way required. The sentence now explains the immediately preceding one (hence the "for") by showing that slaves perceive but do not have reason because they perceive reason in the same way animals do, not by reason, but by feelings. Animals, it is clear, perceive their master's reason (what it is their master wishes them to do) by what they feel or suffer, as the tug of the reins, the shouted commands or whistles, and so on. Of course they do not perceive the reason embodied thus in their master's commands *by* reason (for they lack reason), but they perceive it nevertheless.

According to this interpretation, then, Aristotle is saying that slaves by nature, or those whose best work is the use of the body, perceive reason in exactly the same way as animals do. Hence, like animals, they are living tools, able to take the place of the mythical robots of

chapter 4 because able to perceive and obey what their master wishes them to do. That is why Aristotle immediately goes on to draw another parallel with animals. All that can be got from those whose best work is the use of the body is all that can be got from animals too, namely help with the body in the supply of necessities. They are living tools, in other words, for the needs of life.[21]

Such is the logical structure, as I take it, of Aristotle's second proof. Two clarifications, however, seem necessary at this point. The first concerns what sort of reason is being denied to the slave. For later on Aristotle speaks of slaves as capable of acquiring certain kinds of knowledge and skill (i 7) and as capable of virtue (i 13). It is perhaps necessary, therefore, to distinguish between reason and reasoning.[22] Slaves may have reasoning and be able to learn and work things out (just as some animals can up to a point), but it does not follow that they have reason and can discern the good and the beautiful. But this kind of discernment must be what Aristotle has in mind. For what the slave lacks and the master has is foresight and deliberation (1252a31-34, 1260a12), and these must refer to such discernment since the master must foresee and deliberate about the end of the household and the city, which is the good and the beautiful, or in general virtue. Such discernment marks the difference between the few who are fit to learn about virtue and the many who are not (so the last chapter of the *Ethics*). It also marks the difference between prudence and mere cleverness (*Ethics* 1095a2-b13, 1144a23-b1, 1179b10-18). Slaves by nature therefore may have reasoning and be clever, but they cannot have reason nor be prudent.

The second clarification ties in with the first. When describing the slave by nature Aristotle speaks only of those in a certain *condition*, the condition of having no better work than use of the body. He says nothing about how they come by this condition. The phrase "by nature" and his earlier assertion that some things are separated into ruler and ruled as soon as they are in being suggest that the slave must have this condition from the beginning or from birth. But

[21] Some commentators have argued that the sharing in reason Aristotle allows to the slave must make the slave like desire to mind and not like body to soul and animals to humans. Hence they conclude that Aristotle's argument fails since it really shows that those who so share should not be ruled despotically but politically or royally instead: Fortenbaugh, in Barnes et al. (1977) 135-139; Smith, in Keyt and Miller (1991) 142-155; Schütrumpf (1991) i 265-266. But Aristotle's point is that slaves are like the body because their best work is the use of the body, and that they are like animals both for this same reason and also because (given my translation of the disputed sentence) they perceive reason like animals. This perception of reason, however, cannot make slaves to be like desire to mind, just as it cannot make animals to be like desire to mind either. On the contrary such perception is precisely what is required to make them like the body by making them able to follow the commands of another's reason as the body follows the commands of the soul. Aristotle does, it is true, say in the *Ethics* (1102b25-03a3) that desire, though not itself reason, can share in reason by hearing and obeying it. But this sharing is evidently more than the sharing that the body has in the soul, or than the sharing that animals have in reason. For something better can be got from desire than use of the body, namely the perfection of virtue. Desire in fact appears in some way to come to possess reason and not merely to perceive it. The moral virtues exist in the desiring part of the soul when it is thoroughly habituated, and this habituation it possesses in itself as its own imprint, so to speak, from reason. That is why Aristotle can say that moral virtue makes the goal and choice to be right and makes one pursue the right end, that its presence is necessary for the intellectual virtue of prudence, and also that absence of virtue, or vice, makes one unable even to see the true good (*Ethics* 1144a7-8, 20-36, 1144b30-1145a6).

[22] Milani (1972) 117-119, see also Schofield, in Patzig (1990) 14-16. Such a distinction is certainly implied by what is argued in i 7, and cf. Plato *Laws* 689a1-e3.

if, as proposed earlier, "slave by nature" just means "he who has the nature of a slave," and if "as soon as they are in being" refers not to birth only but to any way of coming into being, then perhaps one can come by the relevant condition, and so become a slave by nature, in more ways than by birth, by accident, say, or upbringing or even choice. After all animals acquire their tameness not from birth but from later training, and yet once they have this condition they are tame by nature.

1254b27 Some confirmation of this supposition comes in these next remarks about the body of the slave (lack of reason has described his condition of soul). It would seem most desirable that slaves, given their function, should have bodies fit for physical labor, and conversely that the free, who are to live a political life, should have bodies fit for the activities of war and peace. If therefore nature aims at the best, she must aim at this. Her aim, however, often fails and those who have slavish bodies have free souls and *vice versa*. Did she not fail so often there would, it appears, be far less doubt about the naturalness of slavery. The manifest difference in the bodies of slave and free would convince everyone of the fact. In some support of Aristotle one may note that we also give special honor and worship to beautiful bodies, as of athletes, filmstars and others whom we are pleased to call our idols. But we recognize also, at least when we reflect seriously, that greater honor and worship are due to beautiful souls. Beauty of soul, however, is harder to see, being a matter of virtue not figure or stature.

Herein lies the solution to a certain difficulty. That nature sometimes fails is evident; monstrous births are obvious instances. But such failures do not happen often nor for the most part. The difficulty is how the failure in the case of slave and free can be so frequent if nature is really at work. The answer is that while beauty of body lies within nature's control beauty of soul does not. We are indeed born by nature for virtue but the achievement of it is by human action, not by nature. The actual achievement of a beautiful soul requires a legislator and education and these are no longer an affair of nature. Nature can nevertheless be said to want beautiful souls in beautiful bodies for she has made humans for virtue, that is, she has made them to be completed by legislation and training (1332b8-10, 1337a1-3). The best thing, of course, would be to have the best body, or the best preconditions, and the best education, for thus would the simply best, the best by nature, be achieved. Hence when outlining his simply best regime (iv/vii and v/viii) Aristotle requires the presence of both. But if the preconditions are best and the education deficient, the result will be slavish souls in free bodies; and if the preconditions are poor but the education good, the result will be free souls in slavish bodies (at least if the souls are capable of education). The failures in nature's wish therefore spring from us, not from nature. It is clear then that slavish souls need not arise from birth alone; they could arise in as many ways as they could fail to be educated.

1254b39 The chapter has concentrated on slaves by nature as those whose best work is the use of the body, but thereby the free and masters by nature have also become evident as those who have reason of themselves, can discern the good and the beautiful and are fit for the life of the city in peace and war. The difference is above all a matter of souls, not bodies. The free by nature have free souls and slaves by nature have slavish souls. The bodies may or may not correspond.

Chapter 6: Slave and Master by Law
Against Those Who Altogether Condemn Slavery

1255a3 The distinction between the slave by nature and the slave by law is an important one but it evidently does not, by itself, settle the question of the justice of slavery by law. For what is not hard to see (at least in the light of the last chapter), and what Aristotle proceeds to discuss, is not that slavery by law is always unnatural and unjust, but that it is sometimes unnatural and unjust, depending on whether those forcibly enslaved are by nature slaves or not. Those who condemn slavery will thus be right when the slave by law is not also a slave by nature, and otherwise wrong.

That charges of illegality should be brought by those versed in the laws is not surprising; they of all people should know what is and is not contrary to established law. In this case, however, they are not condemning a proposal for a law but a law already in existence. That is perhaps why Aristotle calls it "this principle of justice," for any law, even a bad one, may be given such an appellation merely because it is a law. In the case of bad laws, of course, the appellation will carry more than a hint of irony, as it must for the opponents of the law in question. For their charge is that this law is the antithesis of law since, as they say, justice and force are opposed (1253b21-23). But if justice and force are opposed, this fact will only constitute an objection if the law rests on force and nothing more. For even the most just laws need force to back them up. Here is where the opponents of this law are guilty of the sort of sophistry not unusual in debates in public assemblies. A law that rests merely on force is easy enough to condemn since by that fact it has already been declared unjust. But what really needs proving, and what these opponents do not prove, is that the law in question does rest wholly on force. Their argument is a simple *petitio principii*.

1255a11 Aristotle's turning to the wise is not surprising; they at least may be expected to speak more soundly on the matter. But precisely how to interpret Aristotle's account of their disagreement with each other is a matter of much doubt.[23] My own interpretation is based on certain ways of reading the Greek. First of all I take the whole of the sentence following "when virtue gets hold of equipment" as depending on that clause (so the "both...and" representing the *kai...kai* of the Greek). Hence, in opposition to most others, I understand the conqueror being talked about not to be just any conqueror excelling in just any good (including mere strength), but only the conqueror who excels in virtue. The conqueror who excels in force or equipment alone would be the conqueror whose enslavement of the conquered is rightly thought terrible by those versed in the laws. But the wise are presumably being more sophisticated and are expressly noting that some conquerors can excel in force because they first excel in virtue. Those versed in the laws, by contrast, pay no attention to any differences in virtue between conqueror and conquered. One would, however, expect the wise not to ignore such differences and to be talking about conquerors who excel in virtue and not simply in force. That is why the force used against the conquered "seems not to be without virtue" because the wise expressly have in mind cases where the conqueror excels in virtue.

The dispute among the wise is not therefore about the superiority of the conqueror, but

[23] Newman (1887) ii 150-152, Schütrumpf (1991) i 272-281, Susemihl and Hicks (1894) 163-166, 205-209; and see also Lord (1984) 248 n19, Saunders, in Moffat (1984) 25-36, and Schofield, in Patzig (1990) 23-27.

about "the just" (*to dikaion*). Most commentators take this to mean the justice of the matter or something of the sort. But "this just" (*touto to dikaion*) was earlier used, as all agree, to refer to the law ("this principle of justice" as I translated it). I suggest that we understand it the same way here as well. The next sentence will then be interpreted as follows. Some of the wise think the law kindness[24] and not terrible because they think it is meant to apply only to cases where the conqueror excels in virtue, and hence that it only allows the enslavement of natural slaves. Others among the wise, by contrast, think the law of conquest simply means that any conqueror is to rule, whether excelling in virtue or not, and hence that it is terrible as allowing the enslavement of anyone who is conquered, including those who are not natural slaves.

Both groups of the wise are relying on the common premise about force with virtue so their arguments "overlap" in this common premise though their conclusions differ. The difference arises, of course, because some think the law in question is meant to conform to this premise and the others that it is not. This difference itself doubtless springs from the fact that the law gets interpreted and used in different ways at different times. For it exists after all only in convention and in what is commonly said, but what is said and what is meant by what is said often differ. Hence there will always be room for disagreement about what the law concretely means. Aristotle accordingly leaves the dispute among the wise unresolved. But once their arguments are set aside the weakness in the other arguments, namely of those versed in the laws, becomes evident. For these other arguments, being stated without any of the qualifications of the wise, require one to conclude that even the better in virtue ought not to rule and be master, which chapter 5 has just rejected.

Against Those Who Altogether Approve Slavery

1255a21 The first opponents went too far in condemning slavery; these next ones go too far in approving it. The law they cling to is something just indeed, but it need not be wholly just. In fact, as has just been shown, it can be given an unjust, or terrible, interpretation. Their error is easily exposed. To maintain baldly that "the rule won from war" is just, or that the conquerors may always rightly enslave the conquered, lands one in the difficulty of saying that those not deserving to be slaves could justly be made slaves if conquered. Hence they would be compelled to admit that the most nobly born, including themselves (for doubtless they consider themselves such), should be made slaves if defeated in war. So to escape this consequence they limit slavery in war to barbarians and thus deny what they first said by denying its universality. But then in effect they are saying that regardless of what happens in wars barbarians are by nature fit for slavery while others, notably themselves, are not.

It is perhaps not without significance that Aristotle says about these opponents that they are "looking for," not that they have found, the slave by nature. For Aristotle has not himself identified slaves by nature with barbarians; he has defined slaves, not according to national origin, but condition of soul. Indeed the last chapter, where he gave this definition, is entirely silent about barbarians. Had his opponents found the slave by nature they too would speak of conditions of soul. Of course it may be that most barbarians are inferior in soul but it is *qua* inferior, not *qua* barbarian, that they will be natural slaves, and that is what these opponents

[24] All the manuscripts have "kindness" (*eunoia*), but the interpretations favored by most commentators require them to prefer Ross' alteration of it to "folly" (*anoia*).

seem to be missing.

1255a32 They are missing it also about good birth, as Aristotle illustrates through a poetic quotation. To appeal, like Helen, to good birth to justify freedom over against barbarian slavery is to think that the goodness of parents is continued in children. Hence it is to think, as Aristotle says, that what really matters for freedom and slavery is virtue and vice (for otherwise the appeal to the *quality* of birth would be irrelevant). The error here is not the view that vice and virtue are what mark the difference between slave and free (for Aristotle has himself just adopted that view in chapter 5), but the view that virtue is always continued from parents to children. Nature fails here just as she failed (in the last chapter) to match bodies and souls. Virtue, or beauty of soul, is not a result of birth or nature but of training under good laws. Hence the reason, perhaps, why Aristotle chooses to name the speaker and not just the author of his quotation. For there was certainly a wide discrepancy between Helen's body and soul, since though fabled for beauty of body, she was an adulteress, and adultery is base, not beautiful (*Ethics* 1107a8-17). Helen is an instance of someone noble by birth but by nature, that is, by her condition of soul, a slave.[25]

Summary

1255b4 The summary covers chapters 4 to 6 in reverse order. The dispute about the justice of slavery (chapter 6) has a basis in the fact that, because of the unjust application of the law of conquest, not all those who are slaves deserve to be slaves. But by the same token not all those who are free deserve to be free (as Helen). Still where slave and free do deserve to be such despotic rule by the second over the first is just and beneficial (chapter 5). The slave belongs to the master as a part to the whole (chapter 4), hence to exercise mastery badly must be harmful to both, for to harm the part is to harm the whole. The extreme form of such harm must be when master and slave are so only by force, for then they will not really be master and slave and so not really whole and part. In such cases neither master nor slave will have the friendship or advantage involved in mutual benefit: not the slave because he suffers injustice, and not the master because he inflicts it.

3) CONCLUSION

What Aristotle means, therefore, by the slave by nature is not only, and not even typically, the mental incompetent most frequently suggested by commentators, but the moral incompetent, those he characterizes in these chapters as the corrupted and vicious (whether this be by birth, upbringing, choice, or whatever). That such people may in some sense have reason is not to the point. Their reason is enslaved to the passions so that it does not operate as reason. For the true commands of reason they do not perceive nor obey by themselves, but only insofar as they are subjected to the rule of others, that is to say, only insofar as they perceive these commands through what they suffer at the hands of natural masters, the virtuous. With such people it is as if they did not have reason but were no better than animals. Doubtless many barbarians will be

[25] Even if most barbarians are in fact slaves by nature (as Aristotle seems inclined to think, iii 14: 1285a16-22, iv/vii 1327b27-29), that does not prevent some Greeks also being such. For since slavery is a matter of soul, slaves by nature could in principle be found anywhere.

in this position, but not all of them need be. More to the point, however, is that a considerable number of Greeks will certainly be in this position, above all the many and those the many admire. Consequently, the problem with natural slaves will not be that they are insufficiently numerous,[26] but that they exist in too great abundance. This point comes out, in fact, in Aristotle's later discussion of regimes where he indicates that in most cities there are too many wandering around free who are in fact slaves.[27]

But however that may be, Aristotle's view about slavery can be summarized in the following phrase: the natural masters are the virtuous and the natural slaves are the vicious. This view fits in with, and may in fact be said to fall out of, the teaching of the *Ethics* (where the many are certainly characterized as slavish and bestial).[28] It is, moreover, not a view peculiar to ancient Greeks or Aristotle. For if I may be permitted to close by quoting holy writ: "the fool becomes slave to the wise."[29]

[26] As J. Lear, for instance, thinks (1988) 199.

[27] So in particular iv 11.

[28] e.g. *Ethics* i 5: 1095b19-20.

[29] *Proverbs* xi 29 (aptly quoted by St. Thomas in his commentary on the *Politics*). The fool here is of course the moral fool. Compare also Milton, *Paradise Lost* xii 97-101: "Yet sometimes nations will decline so low/ from vertue, which is reason, that no wrong/ but justice, and some fatal curse annext/ deprives them of their outward libertie,/ their inward lost."

Are Restrictive Rules Leadership Tools?: House Special Rules and the Institutional Design Controversy

Barbara Sinclair
University of California, Riverside

Much recent theoretical controversy in legislative scholarship revolves around questions of institutional design. What drives institutional arrangements? scholars ask. That is, what is the core problem members of the legislature are attempting to solve via the institutional arrangements they choose? Is it to secure gains from trade, to promote the development and sharing of expertise in an intrinsically uncertain world or to overcome collective action problems more generally? Second, what is the key institutional mechanism through which the problem is tackled? Is it committees? Is it parties? Or perhaps some combination?

This analysis of special rules in the House is intended to contribute to the debate directly if modestly by testing the predictions the theories make about rule choice. More importantly, I will argue that the data and the analysis presented here suggest three desiderata for an adequate theory. As is becoming increasingly recognized, the importance of party and party leadership in the House of the 1980s and 1990s suggests that an adequate theory must incorporate party as a key mechanism.(See, for example, Davidson 1992; Rohde 1991; Shepsle 1989; and, of course, Cox and McCubbins 1991 and Kiewiet and McCubbins 1992). The change in the centrality of the party leadership over time suggests that an adequate theory must be dynamic: members' answer to the core question -- if not the question itself -- may change over time. Third, a detailed look at the design of some rules suggests that our theories need to posit multiple goals.

Special Rules and the Transformation of Floor Decision Making in the House

Thanks largely to Bach and Smith (1988), congressional scholars are familiar with how the character of special rules for the consideration of legislation in the House changed from the mid-1970s to the mid-1980s (see also Sinclair, 1983, 77-85, 130-133). In the mid-1970s most legislation was brought to the floor under a simple open rule which allows all germane amendments; by the mid-1980s, only 55 percent of rules were simple open rules; many rules restricted amending activity in some say, many contained various complex provisions governing floor consideration (Bach and Smith, 1988, 51).

Table 1 shows that the trend toward more restrictive rules has continued. Rules that restrict the offering of germane amendments accounted for two-thirds of the rules granted for initial consideration of legislation in the 102nd Congress (1991-92).[1] Restrictive rules include so-called modified open and modified closed rules as well as completely closed rules. The modified rules may allow many amendments or very few but always constrain members' amending activity more than does ordinary House floor procedure.

Prepared for delivery at the 1993 annual meeting of the American Political Science Association, Washington, D.C. Sept. 2-5. Copyright by the APSA.

Table 2 provides a somewhat different perspective on the phenomenon. It is based upon only major measures as defined by Congressional Quarterly's list of major legislation, augmented by those measures on which key votes occurred (again according to Congressional Quarterly). Although legislation brought to the floor under rules is generally of some significance, it nevertheless does vary widely in importance.[2] The rules used to bring these major measures to the floor were examined to ascertain whether they were simple open rules, closed rules, or took some other more complex form.[3]

Unlike the other compilations available, data on a pre-reform congress are included and show that, in fact, in the 91st Congress (1969-70) almost all rules for major legislation were either simple open or closed rules. Four out of five measures were considered under simple open rules; most of the remaining measures were brought to the floor under closed rules and most of those (5 of the 7) were bills from Ways and Means. The two rules which fell into neither of the traditional categories but had more complex provisions were expansive rules; they made in order amendments or substitutes -- in both cases ones supported by the president -- that would not otherwise have been in order under House rules. In the 94th Congress, the first in which the reforms were fully in place, almost 80 percent of measures were considered under a simple open rule -- no real changed from the pre-reform congress for which we have data. However, only one measure was brought to the floor under a closed rule; rather measures that would have been considered under a closed rule in the past -- tax measures from Ways and Means -- were being brought to the floor under a restrictive but not totally closed rule. New procedures and processes -- multiple referral and the budget process -- dictated several other complex but non-restrictive rules.

The frequency of simple open rules dropped steeply between the 94th (1975-76) and the 97th Congress (1981-82) and again between the 97th and the 100th and 101st (1987-90). By the late 1980s, three-quarters of major measures were considered under complex or closed rules. Closed rules made something of a comeback after almost disappearing in the 94th but remain relatively little used. The big increase is in complex but not closed rules and, from the 97th Congress on, almost all the complex rules to a lesser or greater extent restrict amending activity.

In the contemporary House, major legislation is highly likely -- and considerably more likely than other legislation -- to be brought to the floor under a complex and usually restrictive rule. The Rules Committee now frequently requests members to submit their amendments to the committee before the rule is considered and reports rules that make in order only those amendments printed in the report or specified in the rule. Complex rules are routinely used to structure floor consideration on major legislation. Devices such as king-of-the-hill procedures, self-executing provisions and chairman's en bloc authority may be combined singly or together with waivers of House rules and restrictions on amendments (see Survey of Activities of the House Committee on Rules 102nd Congress). Standard operating procedure for the consideration of major legislation on the House floor has changed enormously. Were he to return, Sam Rayburn would need an orientation course.

Rule Choice: A Cross-Sectional Analysis

The use of restrictive rules must on balance benefit members of the House. After all, a simple majority of the members can defeat or amend and thus alter the character of any rule. Since restrictive rules constrain members, the benefit must be great enough to outweigh that cost. If that cost can be assumed to be non-negligible, then it is reasonable to assume that the now prevalent complex restrictive rules are an answer to some key problem members face as they attempt to advance their goals within the House of Representatives.

If that be granted, an analysis of rule choice should shed light on the central question motivating the study of institutional arrangements. Specifically, at least two of the contending theories make sufficiently different predictions about when the House should choose to employ restrictive rules to allow empirical tests.

The distributive theory (really a family of related theories) and Keith Krehbiel's informational theory are sufficiently well known to not require much detailing here. The third approach which sees party leaders as agents helping members overcome collective action problems receives more elaboration because the version used here, while broadly similar to that of Kiewiet, Cox and McCubbins (1991, 1992), also differs in some key respects.

Briefly then, distributive theory sees the core problem members of the legislature seek to solve via institutional arrangements as how to secure gains from trade. The institutional answer is a committee system in which members self select onto the committee with the jurisdiction of greatest interest to their districts and committees have disproportionate influence on policy outcomes within their jurisdiction. How this arrangement which is, in effect, a comprehensive log roll is maintained in the face of every present incentives to defect is an unsettled theoretical question even within this family of theories. Restrictive rules certainly offer a possible if partial answer and most distributive theorists see restrictive rules as tools for hastening and holding together agreement on legislation (see Krehbiel, 1991, 160-164).

Distributive theory's predictions about what sort of legislation is most likely to be considered under a restrictive rule are, however, not completely clear. According to one interpretation, distributive--i.e. pork barrel--legislation is most likely to receive the protection of a restrictive rule (Krehbeil 1991, 162). That prediction can be tested. Other versions of the theory see all or most legislation that emerges from committee as a component of the comprehensive logroll and make no clear or testable predictions about which bills should receive a restrictive rule.

Within Krehbiel's informational theory the core problem is "to capture gains from specialization while minimizing the degree to which enacted policies deviate from majority-preferred outcomes" (Krehbiel, 1991, 5). The institutional solution is again a committee system but one that, via membership selection and the more limited and contingent granting of parliamentary rights, keeps committees under the influence of and responsive to the chamber. Within this theory, legislation that embodies the application of specialized expertise by a relatively representative committee and about

which members believe they have good information is more likely to receive a restrictive rule.

A third approach sees the core problem as overcoming the collective action problem inherent in legislating which is necessary for the advancement of member goals. The solution -- or, more accurately, part of it -- is party and party leadership.[4]

Lawmaking is a complex enterprise and, as such, its adequate performance depends upon a number of component tasks being satisfactorily carried out. Agenda setting, policy formulation and vote mobilization are all prerequisites and each in turn depends upon a variety of subsidiary activities. The time and effort that legislating takes presents the legislature's membership with a collective action problem. Even if every member has an interest in given legislation passing, bearing the costs of carrying out the prerequisite tasks may be in no member's individual interest. For no member are the benefits likely to be so great that she has an incentive to bear the entire cost of producing the legislation alone. Furthermore legislation is a public or collective good; if legislation a member favors is enacted, he gets the benefits therefrom whether or not he contributed to its passage. Consequently every member has an incentive to "free ride," to allow others to bear the costs while he reaps the benefits without contributing to their production. Since the same calculus holds for all members none are likely to contribute, the collective good -- legislation -- will not be produced and all will, by assumption, be worse off than if they had each contributed to the production of the collective good.

Leadership in legislatures can be conceptualized as having been instituted to ameliorate problems of collective action. Along with other congressional structures, leadership positions are created to give certain members incentives to carry out necessary tasks that otherwise might not be performed. Saying something more about the character of organizational choices requires assumptions about the goals members seek to advance and some showing that those goals are linked to the passage of legislation.

Here, following Fenno, I will assume that members of the House have some mix of the goals of reelection, good public policy and influence in the chamber.

Is the passage of legislation significantly related to the advancement of any or all of these goals? Obviously, those members for whom good public policy is a prominent goal are dependent upon legislation passing for the advancement of their goal. But members solely interested in reelection also have an interest in the passage of legislation. The particularized district benefits that Mayhew and many distributive theorists see as so critical for reelection are contained in legislation. Some broader legislative proposals become sufficiently salient that their passage pleases constituents. To the extent that the party's or the Congress's record influences voters' decisions, passing legislation becomes important (see Kiewiet and McCubbins 1991; Cox and McCubbins 1992; Jacobson 1992). The political elites who provide financial and other sorts of campaign aid are likely to be very much interested in legislative results. Finally, for the influence-oriented

member, winning is critical and, in the legislative context, that usually means legislating successfully.

If, at least some of the time, the passage of legislation is necessary to advance their goals, members of Congress have an interest in developing and maintaining organizational forms that will allow them to overcome collective action problems and legislate. Why might one of those organizational forms be parties and a party leadership structure? Briefly, so long as members are assumed to have heterogeneous legislative preferences, there is an advantage to organizing a subgroup that is large enough to enact legislation but homogeneous in its legislative preferences relative to the membership as a whole. The political party is such a subgroup. And such a group is large enough to have collective action problems of its own and so require a leadership structure. (Of course, the extent of legislative preference homogeneity can vary over time. It is a function of the extent to which the legislation members want-- for reelection reasons and to satisfy their policy goals--is congruent or conflicting within the party. I will argue later that the extent of such homogeneity is one important determinant of the powers and resources members give their leaders.)

Within this framework, congressional party leaders are seen as agents of the membership which selects them and charges them with advancing members' goals, especially though not exclusively in those ways that require collective action. Specifically the approach conceptualizes leaders as agents charged by their membership with facilitating the passage of legislation. To enable them to carry out the tasks with which they are charged, leaders are given by their members certain powers and resources. Of necessity, these are powers and resources that enable the party leadership to involve itself in and affect the outcomes of the legislative process.

Within this framework, restrictive rules are devices the majority party leadership uses to advance the goals of its membership. One would thus expect the leadership to employ restrictive rules on major legislation important to the party membership, to use them when the majority party is reasonably united and when, as a result of either procedural or substantive complexities or partisan opposition, floor success is not assured.

The three theories' predictions will be tested using data on those measures considered major by close contemporary observers in the 100th and 101st Congresses. Of the 90 such major measures, 71 were brought to the House floor under rules and they constitute approximately 30 percent of the measures considered under special rules during those congresses (see Tables 1 and 2).

Following Krehbiel, I define for the purpose of the analysis open and modified open rules as unrestrictive and closed and modified closed rules as restrictive.[5] It should be remembered, however, that modified open rules also restrict amending activity though to a lesser extent than modified closed rules. According to this definition, 48 percent of the major legislation in the 100th and 101st Congresses was brought to the floor under restrictive rules -- 47 percent in the 100th and 49 percent in the 101st.

According to one version of distributive theory, the greater the distributive content of legislation the more likely the rule for consideration is to be restrictive. To test that hypothesis, I use Krehbiel's measure of distributive content which consists of the number of states listed by LEGI-SLATE as being specifically and directly affected by the bill as a proportion of the total number of LEGI-SLATE key words (also called subject terms) plus the number of states (Krehbiel, 1991, 170).

According to Krehbiel's informational theory, restrictive rules will be associated with committee specialization, nonoutlying committees, heterogeneous or many committees, and, because of confirmatory signaling, minority party support for the bill (165-66). For those bills that are singly referred, Krehbiel uses several committee-specific measures as indicators of the extent to which committee is representative and expert. When, as here, only major legislation is considered, the proportion that is either multiply referred or omnibus (for which committee specific measures make little sense) is too high to make that a feasible strategy of analysis; fully 37 of the 71 measures here under consideration were either referred to more than one committee or were omnibus measures like reconciliation bills. Consequently, to test the hypotheses derived from informational theory I follow the strategy of analysis Krehbiel used for multiply referred measures.

The extent of specialized expertise embodied in legislation is, following Krehbiel, measured by the number of laws that would be amended or repealed by the legislation at issue as listed by LEGI-SLATE. The number of committees to which the legislation was referred is used as an indicator of the preference heterogeneity of the legislators who drafted the bill. Both should be positively related to the likelihood of a restrictive rule. The number of Republican cosponsors is the indicator of minority party support. It is hypothesized to be positively related to the likelihood of receiving a restrictive rule because a large number of minority party cosponsors serves as a confirmatory signal. Still following, Krehbiel, I also include in the equation his measures of urgency (a dummy variable singling out debt limit increases, continuing resolutions and supplemental appropriations bills), scope (measured by the number of LEGI-SLATE key words) and partisanship (measured by the number of Democratic cosponsors). Krehbiel includes the latter as a test of the hypothesis that rules are partisan instruments, which conflicts with his theory.

The third approach, of course, does see rules as instruments of the majority party leadership. If restrictive rules are leadership tools then, of course, legislation on which the leadership is involved in a major way is more likely than other legislation to be considered under restrictive rules. Major party leadership involvement on the measure is also used as an indicator that the legislation in question is of importance to the party (see Sinclair 1992A).[6] Floor coalitions that are party coalitions are expected to be positively associated with the likelihood of restrictive rules. The character of the floor coalition is not solely determined by member preferences but is also influenced by the rule itself. Nevertheless, whatever the rule, when a majority of Democrats (and in most of these cases a very substantial majority) support the legislation on all significant floor votes, which is the definition of a party floor coalition, we can infer a reasonable level of

agreement within the party on the basic legislation. A majority of Republicans voting in opposition on all significant roll calls suggests that the legislation faced some difficulty on the floor. Opposition from the minority party is not the only threat to the floor passage of legislation majority party members want. The procedural complexities raised by multiple referral of legislation and the uncertainties of bringing legislation of very broad scope to the floor under a procedure allowing all germane amendments are also threats. Consequently, multiply referred or omnibus legislation should be more likely to be considered under restrictive rules than non-omnibus, single referred legislation.

Replicating Krehbiel's tests, I estimated an equation with distributive content, his theoretical and empirical variables and his measure of partisanship as independent variables. Logistic regression is used. As Table 3 shows, the analysis provides little support for either the distributive or for Krehbiel's hypotheses. The independent variables as a group provide no significant improvement over the null model. The only predictor variable with a coefficient that is significant by conventional standards is the specialization measure and it is of the correct sign. The effect is, however, weak and a wide variety of other specifications of the equation neither strengthens it or produces a significant model. The coefficient of the heterogeneity measure -- number of referrals -- has the wrong sign as well as being nonsignificant while the number of Republican cosponsors is clearly not significant. Krehbiel's partisanship measure is not significant though it comes closer than most and is of the wrong sign. These data, then, provide little support for Krehbiel's hypotheses.[7] They provide even less for the distributive hypothesis; the coefficient of the measure of distributive content is of the wrong sign though it is nonsignificant. In a variety of other specifications of the equation, the sign for distributive content is consistently negative.

As Table 4 shows, the party model fares a good deal better. The independent variables as a group provide a highly significant improvement over the null model; all of the predictor variables' coefficients are significant and of the correct sign. Thus, the data support the predictions of the third approach with its emphasis on party leaders as agents of a legislation-seeking membership; restrictive rules are more likely on legislation on which the majority party leadership is involved in a major way, legislation that evokes partisan floor coalitions and legislation that is multiply referred or omnibus.[8]

The equation correctly predicts 77.5 percent of the rules -- a good but far from perfect performance. Underlying the dichotomy of restrictive versus unrestrictive rules used in the analysis was a four-valued categorization. An examination of the relationship between the actual value according to that categorization and the value predicted by the equation is enlightening. As Table 5 shows, the equation predicts open rules and modified closed rule very well; 83 percent of the open rules were correctly predicted by the equation to be unrestrictive rules; 84 percent of modified closed rules were correctly predicted to be restrictive rules. The equation does less well in correctly predicting that modified open rules will fall into the unrestrictive category, but since modified open is a borderline type this lesser performance is to be

expected. More disturbing and more interesting is the model's relatively poor performance for closed rules.

An examination of the legislation considered under closed rules reveals that it is somewhat less likely than major legislation as a whole and much less likely than legislation considered under modified closed rules to evoke partisan coalitions on the floor or to be omnibus or multiple referred (though considerably more likely that legislation considered under an unrestrictive rule to be one or the other). Distinctively, however, on every bill considered under a closed rule, the majority party leadership was involved in a major way. The Rules Committee simply does not report a closed rule unless the party leadership is actively involved in the legislative process on the legislative, strongly suggesting that closed rules at least are leadership tools. That closed rules are infrequently used on partisan legislation may indicate something about where the limits of highly restrictive rule use are. Yet in a few cases, close rules were used on contentious partisan legislation. That and even a cursory case by case examination of the use of restrictive rules provides a reminder that special rules especially as they have evolved in recent years are powerful and flexible tools that can be tailored to deal with a variety of problems (see below).

Explaining the Changing Character of Rules

The cross sectional analysis supports the contention that in the late 1980s and early 1990s an activist majority party leadership used restrictive rules as tools for advancing its members' legislative goals. The analysis does not directly help us explain why the use of restrictive rules increased so greatly during the last two decades but certainly provides some possible clues. Space precludes a thorough consideration of the question; my purpose here is only to raise the possibility that members' answer to the key question motivating institutional design choices may not be fixed for all time but can change.

Why, in theory, might one expect such change? In cursory form, such an argument might take the following form. Overcoming the collective action problems inherent in lawmaking requires the delegation by members of institutional powers and resources to subsets of the membership. The House long ago decided to organize itself along both party and committee lines; that is, to delegate to both party leaders and to committees and their leaders. Clearly delegation carries risks. Agents may use the powers granted them to pursue interests not those of their principal. How and how much to delegate to agents, thus, are highly consequential decisions. What tasks, powers and resources are delegated to which subgroups and which are retained by the members as individuals are a function of chamber rules and customs and are not exogenously imposed. Members can change the rules which make these delegations. Given that, the delegation of tasks, powers and resources to an agent should be a function of the costs and benefits to the membership of that particular set of arrangements and should change when those costs and benefits change.

Based on the cross-sectional analysis one might in a straightforward way hypothesize that increases over time in the frequency of major leadership involvement, partisan floor coalitions and multiply referred and omnibus

legislation led to the increased use of restrictive rules. Each of these variables has a costs and benefits interpretation. Because of their broad substantive scope and, for multiply referred legislation, procedural complexities, bringing omnibus and multiply referred legislation to the floor under an open rule entails the risk of substantial costs. When a measure is as broad in scope as a continuing resolution or a reconciliation bill, almost any conceivable amendment is germane and, if all such amendments are allowed, someone may well hit upon a majority-splitting amendment that will unravel the compromise inherent in the legislation. Thus if the frequency of omnibus and multiply referred legislation increased, one would expect a corresponding increase in the use of restrictive rules, which are a device for controlling such costs. The costs to majority party members of being precluded from offering floor amendments decreases as intra-party ideological homogeneity increases (because the legislation brought to the floor by the party's agents is likely to be satisfactory to most members). Consequently, if the frequency of partisan floor coalitions increases, one might expect the frequency of restrictive rules to increase also. Finally, if party leaders are seen as agents of their members, the leaders should involve themselves in a major way on legislation when their members need their help; since restrictive rules are one of the most potent tools at the leadership's command, one would expect increased leadership activity to be associated with an increase in restrictive rules (for a fuller presentation of this argument, see Sinclair, 1992A & B).

In fact, as Table 6 shows, major leadership involvement, partisan floor coalitions and omnibus and multiply referred legislation all increased in frequency over the same period in which the use of restrictive rules increased. The cross sectional and the across time findings certainly suggest a link.

Yet based upon my theoretical framework and empirical findings, I would argue that the change reflects more than simply a change in the values of particular variables in some sort of smooth continuous process; rather it reflects true institutional change, that is, a discontinuity signaled by a change in the relationship among variables. More concretely, during this period, the majority party leadership, responding to its members' altered needs and expectations, became much more central to the legislative process and the relationship between it and the Rules Committee changed in a major way. (For a fuller presentation of this argument, see Sinclair, 1992A & B). The change in the correlation between major party leadership involvement and the character of the rule (open versus closed or complex) over time provides some direct substantiation for this contention. In the pre-reform 91st Congress, the correlation is small and not significant (.17), suggesting that closed and complex rules were not being used as party leadership tools. In the first congress in which the reforms are fully in place, the 94th, the correlation has risen a bit (to .22) but is still not significant. The Speaker has been given the power to nominate all majority party members of Rules, but seemingly Speaker Albert did not immediately make rules into a major leadership tool. For the three later congresses for which data are available -- the 97th, 100th and 101st -- the correlations are significant and substantial (the mean is .45). These results suggest a change not just in the frequency of complex rules but also in who controls the decision on the character of rules. And that suggests significant institutional change.

The Logic of Rule Design

Rules have become highly flexible and powerful tools and, as such, they are used to deal with a number of different problems--organizational, time-management and strategic. Especially interesting are rules crafted strategically to advantage a particular outcome. Legislative strategy generally (including 'going public' strategies as well as the various internal, procedure-based strategies) can be conceptualized as an attempt to structure choices or the environment in which members make choices in a way that alters to the advantage of the outcome the strategist favors the costs and benefits to members of the various alternatives. (See Arnold, 1990, for a somewhat similar argument) The aim in crafting a strategic rule is often, I would argue, to structure floor choices in a way that allows or forces members to choose on the basis of that goal which dictates the vote leading to the structurer's desired outcome. Most frequently, the Democratic leadership tries to structure choices so that its members can base their vote on their notion of good public policy. Conversely, their opponents--most often Republicans--attempt to confront Democrats with votes that make them choose between such concerns and furthering their reelection prospects.
